made last November by the Shropshire, Worcestershire, and Staffordshire Electric Power Co. The balance sheet showed that a sum of £2 253 was expended on capital account during 1928, chiefly on the extension of mains. The depreciation reserve account and the general reserve account which appeared in the 1927 balance sheet had been merged into one account, to which the directors proposed that for the year 1928 £2 954 be transferred out of revenue, making a total of £14 500 standing to the credit of the depreciation and reserve account at December 31st last. The revenue account showed net receipts from the sale of electricity and other revenue at £9 134, compared with £7 911, an increase of £1 223. The directors would bring to bear on the electricity supply problem at Stratford the cumulative experience gained by the Shropshire Power Co. through many years of work. The Power Co. was responsible for electricity supply over an extensive area, comprising industrial, residential, and rural districts, and had successfully supplied electricity over a large area containing districts of widely varying character. The directors would be in a position to offer the town of Stratford a cheap and abundant supply, not merely for lighting purposes, but for heating and power, by interconnecting the Stratford-on-Avon undertaking with the main transmission system of the Shropshire Power Co. The development of electricity for cooking and other domestic services had made rapid strides in the last few years, and was still going ahead at a great rate. They could not, however, undertake the large expenditure necessary for the development of electricity supply in Stratford until an agreement had been reached with the Town Council for the postponement of the Council's option to purchase the undertaking in two years' time. Small undertakings were now prone to be merged with large systems for reasons of economy in production and efficiency in service. The situation in Stratford-on-Avon called for the immediate expenditure of a large capital sum and for a healthy reduction in its present tariffs. Whether these two events were to take place forthwith depended upon the Town Council, with whom the company were in negotiation. The report and accounts were adopted. The report showed that the net receipts for the year amounted to £9 134 5s. which, added to the balance brought forward, £417 5s. 8d., made a total of £9 551 10s. 8d. Administrative and general expenses absorbed £3 096 18s. 9d., debenture interest £914, and income tax £600, leaving a balance of £4 940 11s. 11d.

ELECTRO-TRUST, LTD.—Mr. J. M. Balfour, presiding at the meeting on August 24th, said the accounts for last year covered a broken period during which only part of the company's capital was available. The balance of 5s. a share outstanding on the preference and ordinary shares was called up in October last, and the outstanding preference and ordinary shares were converted into £180 000 of 6% cumulative preference stock and £120 000 of ordinary stock. The balance of profits on realisation from investments during the year under review amounted to £14 387, which had been carried to capital reserve, raising that fund to £24 388. Temporary loan at June 30 stood at £1 593, against £95 000 in the previous accounts. Investments, at or under cost, stood at £345 711, a figure substantially exceeded by their present value. Total revenue was £19 343. Deducting interest on loans, etc., £2 345, management expenses, £1689, and income-tax, £3 828, balance was £11 481. Dividends on the preference shares amounted to £7 920, leaving a balance of £3 561, to which was added the amount carried forward from the previous account, £755, making a disposable balance of £4 317, which they proposed to carry forward. Whereas at their meeting last year he referred to the fact that the first practical effects of the Electricity Supply Act of 1926 could be discerned in the orders for transmission plant which were then being received by electrical manufacturers, the current year had provided ample evidence of the revolution caused by the Act. At December 31 last five schemes, covering all the main industrial centres of England and Scotland, representing in all over 80% of the electrical output of the country, had been adopted, and the work of surveying the actual alignment of the trunk transmission lines planned under these schemes and the negotiation of the necessary wayleaves, was in full progress. To-day the contracts, amounting to many millions, for the greater part of these lines had been placed. As the reforming effect of the Act, which the future would surely recognise as amongst the most valuable legislation of the century, would only be fully appreciable on the supply side of the industry when the "grid" network was complete, this progress was of good augury both to the consumer of electricity and the authorised undertaker. That the public is very fully alive to the possibilities of the future, the persistent interest in public utility securities during the past year bore witness. Indeed, to those who appreciated what a gradual process must be the education in the use of electricity of a large community, whose members, whatever their views in other respects, were almost notoriously conservative in their domestic habits, it might well seem that, despite the satisfactory and regular increase in consumption recorded each year, the future might even, for the moment, have been overdiscounted. A spectacular and wholesale increase in the use of electricity could only be expected when a really cheap supply was generally available, and the process of reorganisation and rationalisation now on foot would have to continue for some years before this could be achieved. On the other hand, when one turned to America, where the present consumption of electricity *per capita* was from three to four times the figure for this country, and was, therefore, proportionately nearer saturation point, there had been in recent months an appreciation in utility securities which no prophet six months ago would have dared to foretell. The report and accounts were adopted.

New Companies.

ELECTRIC RESISTANCE FURNACE CO., LTD.—Cap., £5 000. To carry on business as indicated by title. Reg. office: 17, Victoria Street, London, S.W.1.

PRINCE'S SUNRAY CLINIC, LTD.—Cap., £300. Medical and general electricians, etc. Reg. office: 52, Catherine Street, Liverpool.

WILLIAM C. MACDOWALL, LTD.—Cap., £500. Engineers, dealers in machinery, electrical equipment, etc. Reg. office: 1A, Bensham Manor Road, Thornton Heath.

H. A. AND C. OWEN, LTD.—Cap., £1 000. Dealers in vehicles of all kinds, wireless apparatus, electrical goods, etc. Solicitor: G. C. Rallison, 2, Bristol Chambers, Nicholas Street, Bristol.

LONDON LIGHTING INDUSTRIES, LTD.—Cap., £100. Manufacturers of and dealers in electric globes and lighting specialities, etc. A subscriber: J. Ismay, 108, Westbourne Terrace, London, W.2, solicitor.

STANFORD TRADING CO., LTD.—Cap., £1 000. Mechanical engineers, electricians, suppliers of or dealers in electrical apparatus, etc. Solicitors: Hore, Pattisson and Bathurst, 48, Lincoln's Inn Fields, London, W.C.

BLUNDELL-CURTIS, LTD.—Cap., £100. Manufacturers, importers and exporters of, agents for and dealers in electrical and other instruments, appliances, etc. Solicitor: M. Blumberg, 31, Princess Street, Manchester.

BRITISH AMERICAN CONSTRUCTION CO., LTD.—Cap., £10 000. To construct, equip, work, etc., railways, tramways, electric light, telephonic, telegraphic, and power supply works, etc. Reg. office: 69, Old Broad Street, London, E.C.3.

SOUND PICTURES, LTD.—Cap., £1 000. To adopt agreement with J. H. T. Roberts, and to carry on business of importers and exporters and manufacturers of and dealers in talking machines, etc. Reg. office: 87, Bishopsgate, London, E.C.2.

MAJESTONE, LTD.—Cap., £1 250. Manufacturers of and dealers in apparatus used in connection with production, operation or display of cinematograph films or moving pictures, general and electrical engineers, electricians, etc. Solicitor: E. M. Redhead, 41, John Dalton Street, Manchester.

RADIUM THERMAL INSTITUTES, LTD.—Cap., £10 500. To adopt agreement with A. Phillips and L. Cardozo, and to promote and conduct institutes and centres for administration of radium, radioactive and kindred medical treatments, etc. Reg. office: Balfour House, 119-125, Finsbury Pavement, London, E.C.2.

WALTER JONES, HARVEY AND CO., LTD.—Cap., £5 500. To acquire business of manufacturer of musical instruments, etc., carried on by W. Jones, and business of wireless, electrical and mechanical engineer, and manufacturer of wireless and electrical apparatus, etc., carried on by J. L. Harvey, both in High Street, Swadlincote, Derby. Reg. office: 32, High Street, Swadlincote.

WESTFIELD PROPERTY AND INVESTMENT CO., LTD.—Cap., £5 000; borrowing powers, £5 000 000. To acquire and turn to account lands, etc., in Great Britain or elsewhere. Engineers, manufacturers of and dealers in automatic machines, for producing or supplying electricity, etc. Reg. office: Britannia Buildings, St. Peters Street, Huddersfield. Public company.

F. W. POTTER AND SOAR, LTD.—Cap., £25 000. To adopt agreement with H. R., A. J. P., B. C., and Agnes M. Soar, and to carry on business of F. W. Potter and Co. carried on by above at Phipp Street, Great Eastern Street, London, E.C., and elsewhere, and that of mechanical, ventilating, electrical and wireless engineers, etc. Reg. office: 6-16, Phipp Street, Great Eastern Street, London, E.C.2.

PORTADYNE RADIO, LTD.—Cap., £1 000. To adopt agreement with R. B. Whittingham and E. C. Scott Smith, to acquire trade mark "Portadyne" registered in names of above in respect of apparatus for use in wireless telegraphy and telephony, to carry on the business of manufacturers of and dealers in wireless sets, apparatus and accessories; electricians, etc. Reg. office: 41, The Broadway, Ealing, London, W.5.

ELECTRICAL TRADE MARKS.

This list has been specially compiled for us from official sources by GEE AND CO., *Patent and Trade Marks Agents, 51 and 54, Chancery Lane, London, W.C.2, from whom further information may be obtained.*

TRIOTRON.—499 360. Class 8. Wireless telephonic valves. Radiowerk E. Scrack, Schumanngasse 31, Vienna 18, Austria; manufacturers. January 24th, 1929. Registration of this trade mark shall give no right to the exclusive use of the letter "T." Concurrent user claimed from February, 1924. Sect. 21.

PEEL-CONNER.—485 795. Class 6. Magneto electric machines and parts thereof. The General Electric Co., Ltd., Magnet House, Kingsway, London, W.C.2; manufacturing electrical engineers. November 11th, 1927. To be associated with No. B405 494 (2 212) xiii and another. Advertised before acceptance, the applicants alleging distinctiveness.

PEEL-CONNER.—485 796. Class 8. Telephonic instruments and apparatus and parts thereof. The General Electric Co., Ltd., Magnet House, Kingsway, London, W.C.2; manufacturing electrical engineers. November 11th, 1927. To be associated with No. 484 795 (2 678) vi. Advertised before acceptance, the applicants alleging distinctiveness.

MAJESTIC.—495 573. Class 8. Sound amplifying apparatus and parts thereof, amplifying and rectifying tubes or valves, wireless telephonic apparatus and parts thereof, phonographs and parts thereof, phonograph records and wireless telephonic apparatus in combination with phonographs. Grigsby-Grunow Co. (a corporation organised under the laws of the State of Illinois), 4 540 Armitage Avenue, Chicago; manufacturers. October 2nd, 1928. To be associated with No. 474 235 (2 547).

SAMPSON ACCUMULATOR (SIGN).—501 481. Class 8. Electric accumulators (not for medical purposes). Ward and Goldstone, Ltd., Sampson Works, Frederick Road, Pendleton, Manchester; electrical engineers. April 4th, 1929. To be associated with No. 451 013 (2 430). Registration of this trade mark shall give no right to the exclusive use of the word "Sampson."

BI-LATROLA.—502 038. Class 8. Loud speakers for use in wireless telephony, and electrical sound reproducing instruments and apparatus. Ottomar Voelk, Nachod Strasse 27, Berlin, W. 50; manufacturer. April 22nd, 1929.

TRUVOX (SIGN).—502 533. Class 8. Radio receiving sets, gramophones, radio receiving sets in combination with gramophones, and loud speakers. Universal Gramophone and Radio Co., Ltd., Truvox Works, Ryland Works, Kentish Town, London, N.W.5; manufacturers. May 7th, 1929. To be associated with No. 501 753 (2 673).

OCAM.—503 297. Class 8. Philosophical and scientific instruments. Maco Template and Engineering Co., Ltd., 19, Cursitor Street, London, E.C.4; template manufacturers. June 4th, 1929.

K.L.G. (SIGN).—495 923. Class 13. Sparking plugs, waterproof terminals, spanners, and sparking plug accessories, all being goods made wholly or principally of ordinary metal, and not included in other Classes. K.L.G. Sparking Plugs, Ltd., Robinhood Engineering Works, Putney Vale, London, S.W.15; manufacturers. October 13th, 1928. To be associated with No. 382 583 (2 113). Advertised before acceptance, the applicants alleging distinctiveness.

AEROTO.—501 885. Class 6. Electric fans. The British Aerotechnical Co., Ltd., Astor House, Aldwych, London, W.C.2; manufacturers. April 17th, 1929.

C.R. (MONOGRAM).—496 509. Class 8. Philosophical and scientific instruments. Clareth Reproducers, 3, Queen Square, Leeds; manufacturers of electrical reproducing gramophones.—October 31st, 1928.

COLUMBIA ELECTRO GRAPHOPHONE (SIGN).—510 807. Class 8. Electric talking machines and parts and accessories therefor. Columbia Graphophone Co., Ltd., 102 to 108, Clerkenwell Road, London, E.C.1; manufacturers. April 15th, 1929. To be associated with No. 288 624 (1 524) and others. Registration of this trade mark shall give no right to the exclusive use of the word "Electro."

GOTHIC.—502 551. Class 8. Philosophical and scientific instruments. Gothic Electrical Supplies, Ltd., 5, 7, and 9, Severn Street, Birmingham; manufacturers. May 7th, 1929.

PHILOMONIC.—503 617. Class 8. Wireless telephonic apparatus in combination with gramophones, and parts thereof. Kemble and Co., 97, Carysfort Road, Stoke Newington, London, N.16; manufacturers. June 13th, 1929.

GRADIONIC.—503 618. Class 8. Wireless telephonic apparatus in combination with gramophones, and parts thereof. Kemble and Co., 97, Carysfort Road, Stoke Newington, London, N.16; manufacturers.—June 13th, 1929.

METEOR.—500 786. Class 13. Electric lamps (ordinary). Meteor Electric Lamp Co., Ltd., Sicilian House, Sicilian Avenue, London, W.C.1; electric lamp manufacturers. March 8th, 1929.

SUNRAY TRICITY.—500 946. Class 18. Electric radiators for heating. The British Electric Transformer Co., Ltd., Clayton Road, Hayes, Middlesex; manufacturing electrical engineers and contractors. March 14th, 1929. To be associated with No. 296 927 (1 548) and another.

BRITSULITE.—492 509. Class 50. Electrical insulating materials. British Insulite, Ltd., Belfield Old Road Works, Belfield Old Road, Rochdale, Lancashire; manufacturers. June 19th, 1928.

PHOTO-MATIK—.492 330. Class 8. Philosophical and scientific instruments. Stanley Hart and James Isaac Stealey, 76, West Street, Brighton; manufacturers. June 12th, 1928. (By consent.)

LYRIC.—500 548. Class 8. Electric meters, cables, flexibles, resistances and fitted electric switchboards. Max Weinbaum, 419 to 423, Commercial Road, London, E.1; merchant. March 1st, 1929. To be associated with No 500 550 (2 675) xiii and another.

VEERED.—502 481. Class 8. Loud speaking and sound amplifying instruments. S. G. Brown, Ltd., Western Avenue, North Acton, London, W.3; electrical engineers. May 6th, 1929.

THE VOICE OF ACTION.—503 169. Class 8. Recording and reproducing apparatus for sound cinematograph films. Western Electric Co., Ltd., Bush House, Aldwych, London, W.C.2; electrical engineers. May 29th, 1929. To be associated with No. 503 170 (2 679).

LIVER.—503 394. Class 8. Cables for electrical purpose The Liverpool Electric Cable Co., Ltd., Linacre Lane, Bootle, Liverpool; manufacturers. June 5th, 1929. To be associated with No. 472 162 (2 536).

GROSSAG.—497 780. Class 13. Electric irons, tea and coffee urns, cooking utensils and immersion heaters. Fr. Gross, jr., Aktiengesellschaft, 23, Blendstattstrasse, Schwabisch Hall, Wurtemberg; manufacturers. December 5th, 1928. Address for service in the United Kingdom, c/o M. Oppenheimer, 23, Moor Lane, London, E.C.2.

FERRAX.—504 434. Class 13. Electric lamps (ordinary). Naamlooze Vennootschap Transelectra, Sarphatistraat 43, Amsterdam, Holland; manufacturers. July 12th, 1929. Address for service in the United Kingdom, c/o McKenna and Co., 31-34, Basinghall Street London, E.C.2.

TOASTMASTER.—502 773. Class 18. Electric toasting stoves. Watersgenter Co., 213 to 217, North Second Street, Minneapolis; manufacturers of electrical apparatus. May 14th, 1929. Address for service in the United Kingdom, c/o White, Langner, Stevens, Parry and Rollinson, Jessel Chambers, 88, 89 and 90, Chancery Lane, London, W.C.2.

V.I.R. UNIVERSAL LAMP (SIGN).—501 594. Class 13. Electric lamps. Naamlooze Vennootschap "Vereenigde Industrieen Rotterdam" Voorheen Ph. Verhagen and Zoon, Oude Dijk 149, Rotterdam; manufacturers. April 8th, 1929. To be associated with No. 488 865 (2 637). Address for service in the United Kingdom, c/o Gee and Co., 51-52, Chancery Lane, London, W.C.2. Registration of this trade mark shall give no right to the exclusive use of the word "Universal" or of the device of an electric lamp.

Opposition to the registration of the following trade marks can be lodged up to September 21st, 1929.

TRIOGRANIC.—504 139. Class 8. Instruments and apparatus for use in wireless telephony and telegraphy. Igranic Electric Co., Ltd., 147, Queen Victoria Street, London, E.C.4; electrical engineers. July 2nd, 1929. To be associated with No. 254 366 (1 316) and others.

MICO.—502 624. Class 50. Electrical insulating materials. The Micanite and Insulators Co., Ltd., Empire Works, Blackhorse Lane, Walthamstow, London, E.17; manufacturers. May 9th, 1929. To be associated with No. 420 136 (2 292).

COMMERCIAL INFORMATION

County Court Judgments.

[NOTE.—*The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debt. They may be for actions. But the Registry makes no distinction. Judgments are not returned to the Registry if satisfied in the Court books within 21 days.*]

AVON ELECTRICAL CO., 313, Aigburth Road, Liverpool, electricians. £17 2s. 11d. July 24th.

BAILES, Mr. A., 48, Lewin Road, Streatham, electric lamp salesman. £11 10s. 10d. July 11th.

BULLEN (A. G.) AND CO., 79, West Walls, Carlisle, electrical contractors. £19 16s. 1d. July 16th.

CAMEROFF, J. (trading as J. CAMERON), 147, Spencer Place, Leeds, power and lighting engineer. £15 17s. 8d. July 16th.

DAVIS, Laurence Maurice, 93, Shepherd's Bush Road, W., electrical engineer. £27 10s. June 28th.

ELECTRICAL SUPPLIES CO., 306, Deansgate, Manchester, electricians. £19 9s. 8d. July 19th.

ESSEX COUNTY ELECTRICAL CO., 60, High Street, Woodford Green, electrical engineers. £10 0s. 6d. June 26th.

FRANKS, Mr. B., 2, Dorothy Road, Lavender Hill, wireless engineer. £10 10s. July 16th.

GASCOIGNE, Mr. H., Cricklade Street, Cirencester, radio dealer. £16 16s. 2d. June 27th.

SENIOR'S WIRELESS STORES, 961, Abbeydale Road, Sheffield, wireless dealers. £15 16s. 3d. July 4th.

SHAPLAND, Mr. A. E., 13a, High Street, Budleigh, Salterton, wireless dealer. £14 7s. 7d. July 6th.

SHAW, J. (trading as REX-O-TONE RADIO CO.), 30, Orme Road, Bangor, radio factor. £13 0s. 6d. July 5th.

STATION RADIO STORES, 18, Crystal Palace Station Road, S.E., electrical engineers. £16 18s. 11d. June 24th.

WHITEHEAD, Bertram J., 4, Queen's Terrace, Wonford Road, Exeter, wireless engineer. £20 18s. 9d. July 4th.

Bill of Sale.

THURSTON, William Thomas Stanley, 6, Creswold Street, West Bromwich, electrical engineer. Dated August 22nd, filed August 26th. £40.

Receivership.

BAYLISS, MARCH AND NEWEY, LTD. W. F. Bridgwater, of 3, Cherry Street, Birmingham, was appointed receiver and manager on August 14th, 1929, under powers contained in debenture dated December 14th, 1928.

Mortgages.

[NOTE.—*The Companies Act of 1908 provides that every Mortgage or Charge, as described therein, shall be registered within 21 days after its creation, otherwise it shall be void against the liquidator and any creditor. The Act also provides that every Company shall, in making its annual Summary under the Companies Act, specify the total amount of debt due from the Company in respect of all Mortgages or Charges. The following Mortgages and Charges have been so registered. In each case the total debt prior to the present creation, as specified in the last available Annual Summary, is also given—marked with an *—allowed by the date of the Summary, but such total may have been reduced.*]

ELECTRASTORAGE, LTD. (late JUDD ACCUMULATOR AND EQUIPMENT CO., LTD.), London, W.C. Registered August 15th, £500 debentures; general charge.

"K.N." ELECTRICAL PRODUCTS, LTD., London, E.C. Registered August 12th, £1,000 debenture to P. Ferguson, The Garth, Grange Road, Highgate; general charge.

LEATHERHEAD AND DISTRICT ELECTRICITY CO., LTD., London, E.C. Registered August 14th, £9 800 debentures, part of amount already registered; general charge. *£91 550. March 28th, 1929.

SIGMA ELECTRICAL MANUFACTURING CO., LTD., Birmingham. Registered August 20th, £1 250 1st debenture, to W. H Wright, 190, London Road, Leicester, company director; general charge. *Nil. December 31st, 1928.

Satisfactions.

ATLAS CARBON AND BATTERY CO., LTD., London, S.E. Satisfaction registered August 17th, £3 000, outstanding July 1st, 1908.

BANBURY AND DISTRICT ELECTRIC SUPPLY CO., LTD., London, W.C. Satisfaction registered August 20th, £4 500, part of amounts registered March 31st, 1913, to August 11th, 1915.

WADEBRIDGE AND DISTRICT ELECTRIC SUPPLY CO., LTD., London, S.W. Satisfaction registered August 19th, £350, registered January 18th, 1915.

Private Meetings, etc.

[Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.]

INGHAM ELECTRICAL CO. (THE), LTD., 34, Union Street, Bradford. At the statutory meeting of creditors in the voluntary winding-up of this company the liquidator (Mr. W. H. Curry), submitted a statement of affairs as at July 26th, 1929, showing liabilities of £6 990, of which £6 965 was due to unsecured creditors, and net assets of £1 066, or a deficiency of £5 924. The capital consists of 2 602 ordinary shares of £1 each fully paid up, so that, as regards contributories, there is a total deficiency of £8 525. The company was formed in September, 1926, to take over the business of J. and H. N. Ingham, trading as Ingham Bros. The principal shareholders were Messrs. J. and H. N. Ingham, who were duly appointed joint managers at a salary of £260 per annum each. For the fourteen months ending August 31st, 1927, the turnover was £6 113 and there was a net loss of £2 259, while for the twelve months ending August 31st, 1928, the turnover was £5 262 and the net loss £1 157. The liquidator said that from to time the directors brought further monies into the business by way of loan and at the present time the company were indebted to J. H. Ingham to the extent of £2 787 and to H. N. Ingham £2 908. The meeting resolved that application should be made to the Court for the appointment of Mr. T. A. Stoker, accountant, of 71, Albion Street, Leeds, as liquidator in the place of Mr. W. H. Curry. A committee of inspection, consisting of three of the creditors, was also nominated.

London Gazette, etc.

Companies Winding-up Voluntarily.

NEWCASTLE ELECTRICAL AND MOTOR ACCESSORIES, LTD. Meeting of creditors at the offices of John G. Nixon and Co., chartered accountants, Gibb Chambers, Westgate Road, Newcastle-upon-Tyne, on Tuesday, September 3rd, at 3 p.m.

PAGE ELECTRICAL EQUIPMENTS, LTD. By reason of its liabilities, August 14th. W. Hand, 12, Cherry Street, Birmingham, appointed as liquidator. Meeting of creditors at the offices of the liquidator, Wednesday, September 4th, at 3 p.m.

Bankruptcy Information.

HINE, George Edward, trading as WIRELESS MAINTENANCE SERVICE, 17, The Promenade, Church End, Finchley, and 28, Mayfield Avenue, Finchley. Receiving order, August 21st. Debtor's petition.

MADDOX, Victor Frederick, 6, Homend Street, Ledbury, Hereford, electrical and wireless engineer. Receiving order, August 23rd. Debtor's petition.

WATSON, Stuart Byrne, trading as S.B. WATSON AND CO., 73, Crouch Street, Colchester, Essex, electrical engineer and contractor. First meeting, September 3rd, 12 noon, 9, Arcade Street, Ipswich. Public examination, October 3rd, 11 a.m., Law Courts, Town Hall, Colchester.

WOODHEAD, Titus Ernest, 26, Central Drive, Blackpool, electrical factor. First meeting, September 4th, 11 a.m. Official Receiver's Office, 9, Cannon Street, Preston. Public examination, September 20th, 10.30 a.m., Court House, South King Street, Blackpool.

Notices of Dividends.

CHARLEY, Henry Victor (trading as DINAS POWIS ELECTRICAL SUPPLY CO.), Station Road, Dinas Powis, Glamorgan, electrical engineer. First and final dividend, 1s. 2¼d. per £, payable September 10th, at the Official Receiver's Office, 34, Park Place, Cardiff.

HYDE, Hubert Algernon, 148, Weston Park, Crouch End, North London, lately at 2, East Street, Bromley, Kent, wireless dealer. First and final dividend, 3s. 11½d. per £, payable September 4th, Official Receiver's Office, 29, Russell Square, W.C.1. The above notice is in substitution for notice of dividend of 4s. 1¾d. per £ published in the "London Gazette" of June 4th, 1929, the dividend then advertised not having been paid.

LAURENS, William Hamilton, 492, Prescot Road, Old Swan, Liverpool, radio engineer. First and final dividend, 7d. per £, payable August 30th, Offices of the Official Receiver, Government Buildings, Victoria Street, Liverpool.

KIRK, Ernest William, formerly carrying on business as THE ACE RADIO MANUFACTURING CO., at 26, Curzon Street, Derby. First and final dividend, 3s. 6½d. per £, payable August 27th, Official Receiver's offices, 22, Regent Street, Park Row, Nottingham.

Partnerships Dissolved.

"RHYMOS ELECTRICAL SERVICE DEPOT" and "RHYMOS ELECTRICAL ENGINEERS" (George Frederick MOSS and John RHYDE), electrical engineers, 39, High Road, Wood Green, Middlesex, and at Blenheim Works, Blenheim Road, Wood Green, by mutual consent as from August 12th, 1929. Debts received and paid by G. F. Moss, who continues the business.

WALKER (F. S.) AND CO. (Frederick Sinclair WALKER and Alfred M'DOUGALL), electrical engineers, 6, Queen Margaret Place, North Kelvinside, Glasgow, as at August 20th, 1929, by the retiral of A. M'Dougall. F. S. Walker will continue the business under the same firm name.

Bankruptcy Proceedings.

TABBUSH (JOSEPH) AND CO., LTD., 11, Queen Victoria Street, E.C. Under the compulsory liquidation of this company the Official Receiver reports that the accounts show liabilities £2 672 (including a debenture for £2 500 which is invalid and which the holder has promised to surrender), assets £15 and a deficiency of £159 with regard to contributories, the issued capital being £2. The company was formed in December, 1926, to carry on the business of wireless, radio and electrical engineers and dealers in all kinds of electrical apparatus. The business was mainly as importers of wireless valves. Mr. Joseph Tabbush, the managing director, who is a French national, appears to have purchased the valves in France and to have sold them in this country, advantage being taken of the rate of exchange as between France and this country. That gentleman states that when the French currency was stabilised he was unable to obtain any advantage from the rate of exchange and consequently could not dispose of the valves at a profit. The company ceased to carry on business towards the end of 1927. Mr. Tabbush attributes the failure to the stabilisation of the French currency as the result of which the company had to pay a higher price for the valves, while at the same time British valves were reduced in price and consequently it was not possible to market the French valves at a profit. The company also incurred losses through a number of debtors becoming insolvent. The liquidation remains in the hands of the Senior Official Receiver.

ZONE WIRELESS CO., LTD., Iddesleigh House, Caxton Street, Westminster, S.W. The report of the Official Receiver, who is also acting as liquidator of this company, has been issued to the creditors and shareholders. The accounts lodged under the liquidation show liabilities, £847, assets, £152, and a deficiency of £745 with regard to contributories, the issued capital being £1 000 ordinary shares of 1s. each. The company was promoted by Mr. Drury Dickinson Pyper, as a private company in February, 1928, and was formed *inter alia* to acquire as a going concern the business of wireless apparatus manufacturers carried on by him under the name of Zone Wireless Co., together with the assets and liabilities of the vendor. The work done by the company consisted of the assembling of the various parts which constituted the wireless sets, no parts being manufactured by the company. The business was carried on at a loss and it appears that the wireless sets were sold for lesser sums than the actual cost of production, exclusive of establishment charges. Mr. Pyper attributes the failure of the company to the manufacture of portable wireless sets by other business houses on mass production lines which were being sold at prices lower than the company could produce them.

METAL AND CHEMICAL PRICES.

TUESDAY, August 27th.

		Price.	Inc.	Dec.
Copper—				
Best Selected	per ton	£77 15 0	—	—
Electro Wirebars	„	£84 15 0	—	—
H.C. Wires, basis	per lb.	11 11/16d.	—	—

„ Roll, „ £10 10 0 *Boric Acid* (Crystals) „ £30 0 0
Sulphuric Acid (Pyrites, 168°) Ton £6 15 0 *Sodium Chlorate*—Per lb. 2½d.
Sodium Bichromate—Per lb. 3½d.

Rubber—Para fine, 10½d.; plantation, 1st latex, 10½d.

∴ The metal prices are supplied by British Insulated Cables Ltd., and the rubber prices by W. T. Henley's Telegraph Works Co., Ltd.

THE LEAD MARKET.

Messrs. James Forster and Co. report that trading on the open market was very quiet last week, the total transactions being approximately 3 000 tons. Declarations of Mexican and American lead in steamers due at the end of that week and early this week rather unsettled the market, and August lead was sold down to £22 16s. 3d., but a recovery took place, and, on a good volume of buying, values advanced. The reported formation of a Lead Producers' Association, comprising the productions of Mexico, Australia, Canada, and Burma would imply a closer control in future of the world's supply, outside America. Closing prices showed an advance of 3s. 9d. to 2s. 6d. per ton, compared with the previous week, August shipment closing at £23 2s. 6d., and November at £23 5s.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

313 667 I. M. E. Aitken, D. A. Gordon and Associated Electrical Industries, Ltd. Electrical signalling systems. (23/3/28.)
287 574 British Thomson-Houston Co., Ltd. Electric cooking-devices. (25/3/27.)
313 668 W. J. Line. Electric plugs. (26/3/28.)
313 671 E. Longbottom and R. Milne. Electric circuit-breakers. (28/3/28.)
313 677 M. Edmunds. Apparatus for regulating gas or electric supply in connection with domestic stoves and the like. (31/3/28.)
313 682 Relay Automatic Telephone Co., Ltd. and A. C. Corner. Telegraph concentrator. (3/4/28.)
313 689 D. Lupi. Measurement of electrical energy in triphase circuits. (13/4/28.)
313 691 Santon, Ltd. and H. C. Sanders. Electric heating-elements. (16/4/28.)
313 693 Igranic Electric Co., Ltd., F. J. H. Charman and F. A. Inskip. Thermionic valve circuits. (18/4/28.)
289 471 Associated Electrical Industries, Ltd. Piezo-electric crystals. (28/4/27.)
313 706 A. F. Pollock and D. A. Pollock. Microphones. (27/4/28.)
313 715 A. G. S. Sandison and Electroflo Meters Co., Ltd. Electrical recording instruments of the relay type. (3/5/28.)
291 437 Siemens Schuckertwerke Akt.-Ges. Annealing-furnaces. (3/6/27.)
313 721 J. A. Crabtree. Electric switches. (16/5/28.)
292 096 Standard Telephones and Cables, Ltd. Loading systems for telephone lines or the like. (13/6/27.)
313 722 P. Bruynseraede. Devices for supplying current to thermionic valves. (17/5/28.)
313 723 English Electric Co., Ltd. and G. Schroeder. Excitation of synchronous dynamo-electric machines. (18/5/28.)
313 726 P. Freedman. Metallic-vapour lamps for producing ultra-violet radiation. (22/5/28.)
313 727 P. Freedman. Electric discharge devices for producing ultra-violet radiation. (22/5/28.)
313 729 P. Freedman. Metallic-vapour electrical discharge devices. (25/5/28.)
313 730 H. H. Berry and W. J. Markham. Advertising and the like signs. (25/5/28.)
313 745 B. Peebles and Co., Ltd. and J. W. Rodger. Insulating pressure clamps for electrical apparatus. (7/6/28.)
291 769 Kabelwerk Duisburg. Paper-insulated multiple-conductor electric cables for carrying large currents. (8/6/27.)
303 131 E. Reisz. Electrostatic loud-speakers and the like. (29/12/27.)
292 913 Dr. S. Loewe. Indirectly-heated thermionic cathode. (25/6/27.)
293 034 M. Buchholz. Method and apparatus for protecting transformers, switches, motors, generators, and other electrical apparatus. (30/6/27.)
313 773 J. Henderson. Signal posts for road or street islands for vehicular passenger traffic. (6/7/28.)
313 775 G. Wilkinson. Electrical automatic temperature controllers. (7/7/28.)
293 805 International General Electric Co., Inc. Electric switches of the truck-type. (12/7/27.)
293 880 Associated Electrical Industries, Ltd. Measurement of electrical quantities. (14/7/27.)
313 784 H. S. Cowx. Electromagnetic make-and-break movements and the like. (16/7/28.)
300 115 Federal Telegraph Co. Phonograph pick-up apparatus. (5/11/27.)
300 116 Siemens-Schuckertwerke Akt.-Ges. Enclosed distributing switch-gear with switch apparatus which can be drawn out or lowered. (5/11/27.)
298 077 F. J. Alderson. Electric incandescent lamps. (1/10/27.)
298 238 International General Electric Co., Inc. Oil switches. (6/10/27.)
300 613 Westinghouse Lamp Co. Vacuum electric tube devices. (16/11/27.)
301 838 F. G. Baum. Dynamo-electric machines. (6/12/27.)
301 844 Associated Telephone and Telegraph Co. Telephone systems. (13/8/27.)
303 013 British Thomson-Houston Co., Ltd. Apparatus for condensing mercury or other vapour, and vaporising water or other liquid. (24/12/27.)
309 408 I.G. Farbenindustrie Akt.-Ges. Partitions for separating the electrolytic products in the fusion electrolysis of chlorides, particularly of magnesium. (23/12/27.)
313 429 G. H. Fletcher, R. Brooks and Associated Electrical Industries, Ltd. Electric motors. (9/3/28.)
285 424 Compagnie Lorraine de Charbons pour l'Electricite. Arc-lamp electrodes for heavy currents. (16/2/27.)
299 028 Frigidaire Corporation. Refrigerating systems and apparatus. (20/10/27.)
289 422 W. S. Kimmig. Vacuum tubes. (27/4/27.)
285 837 Allgemeine Elektricitats-Ges. Coil for electric meters and measuring-instruments. (22/2/27.)
313 895 Standard Telephones and Cables, Ltd., T. N. Riley, and R. A. L. Cole. Manufacture of continuously-loaded electric cables. (14/3/28.)
287 096 International General Electric Co., Inc. Quick-acting reverse-current electric circuit-breakers. (14/3/27.)
314 128 J. Poliakoff. Audio-frequency transformers for wired and wireless telephony. (14/1/29.)
301 790 Siemens and Halske A.-G. Circuit arrangement for telephone installations with semi-automatic working. (5/12/27.)
302 267 Siemens and Halske A.-G. Circuit arrangement for telephone installations in which the calling-lines are connected to an operator through call-finders. (13/12/27.)
313 938 B. Thomas and E. Thomas. Selective remote control of switchgear in electric sub-stations. (17/3/28.)
288 138 J. A. Grier and J. A. Warren. Compression refrigerating apparatus. (31/3/27.)
313 985 British Thomson-Houston Co., Ltd., J. V. Peacock, L. R. Nixon, and F. H. Harris. Electric motor control systems. (19/3/28.)
313 986 J. Neale. Sound transmitters involving the use of light waves. (19/3/28.)
297 078 Electrical Research Products, Inc. Television systems. (14/9/27.)
291 370 Electrical Research Products, Inc., Television systems. (31/5/27.)
313 906 Gramophone Co., Ltd., and A. Whitaker. Recording of sounds with the aid of light. (19/3/28.)
313 987 General Engineering Co. (Radcliffe), Ltd., and S. Taylor. Process and apparatus for impregnating insulating dielectric materials. (20/3/28.)
313 942 British Thomson-Houston Co., Ltd., C. W. Wood, and E. Clifford. Locking and interlocking mechanism primarily for use with electric switches. (20/3/28.)
313 991 S. G. S. Dicker (V. Philips' Gloeilampenfabrieken). Electrical installations. (20/3/28.)
313 943 M. E. Elliott. Wireless receiving-apparatus. (20/3/28.)
313 995 J. Lucas, Ltd., and O. Lucas. Vehicle electric lamps. (21/3/28.)
313 996 J. Lucas, Ltd., and O. Lucas. Vehicle electric lamps. (21/3/28.)
313 997 J. Lucas, Ltd., C. Lucas, and W. H. Eggington. Vehicle and other electric lamps. (21/3/28.)
314 003 Gramophone Co., Ltd., and A. Whitaker. Sound-recording with the aid of light. (21/3/28.)
314 107 R. Brooks, W. T. Gray, and Associated Electrical Industries, Ltd. Electric locomotives. (21/3/28.)
314 112 Siemens Bros. and Co., Ltd., and D. A. Christian. Electrical signalling systems. (22/3/28.)
295 572 Associated Telephone and Telegraph Co. Telephone systems. (13/8/27.)
314 122 E. O. Symonds. Amplification of cable signals. (23/3/28.)
314 123 H. Leitner. Electric accumulators. (24/3/28.)
314 124 Siemens Bros. and Co., Ltd., and E. A. Forceville. Electromagnetic devices. (24/3/28.)
290 156 Electroacustic Ges. Air sound-apparatus. (7/5/27.)
314 133 J. Stone and Co., Ltd., and A. A. Mead. Electric lamps or lanterns. (27/3/28.)
314 136 D. Dunnett. Traffic-signalling devices for use on road vehicles. (28/3/28.)
290 655 Landis and Gyr Soc. Anon. Electric measuring-instruments of the induction type. (19/5/27.)
288 160 British Thomson-Houston Co., Ltd. Arc-welding systems. (1/4/27.)
314 146 G. H. Ide and H. L. Bentley. Electric switches. (4/4/28.)
289 048 International General Electric Co., Inc. Electric circuit-breakers. (22/4/27.)
314 152 L. Mellersh-Jackson (Federal Telegraph Co.). Radio antennae. (11/4/28.)
314 160 Telegraph Condenser Co., Ltd., and W. J. Cole. Electrolytic condensers. (18/4/28.)
314 162 J. A. Brook. Devices for locking incandescent bulbs in their holders (19/4/28.)

A RECENT delivery of Morris-Cowley saloons for the use of representatives of the Mullard Wireless Service Co., Ltd. The Mullard fleet of cars comprises over 100 vehicles. Morris-Cowley saloons have been standardised by the Mullard organisation, it being the policy of the company to buy "British."

314 165 F. Foy. Apparatus for heating liquids by electricity. (21/4/28.)
314 167 E. Y. Robinson and Associated Electrical Industries, Ltd. Electric frequency filters. (23/4/28.)
314 181 L. A. Sharland, G. J. L. Armitage, and Dubilier Condenser Co. (1925), Ltd. Gramophone electric pick-up support. (15/5/28.)
314 188 H. R. G. Moore, L. C. B. Johnson, and H. J. O'Dell. Electric relays and contact-makers. (17/5/28.)
295 009 Sulzer Freres Soc. Anon. Absorption refrigerating-machines. (6/9/27.)
291 442 British Thomson-Houston Co., Ltd. Means for mounting filaments in electric discharge devices. (3/6/27.)
314 191 B. H. Stark. Holders or carriers for trolley pulleys used on tramway and like vehicles. (22/5/28.)
314 192 Stirling Telephone and Electric Co., Ltd., and N. Blades. Microphones. (23/5/28.)

Applications for Patents.

May 30th.

16 729 Associated Electrical Industries, Ltd., and N. P. Hinton. Inductance coils.
16 731 Associated Electrical Industries, Ltd., F. E. Bancroft, and P. Mannassi. Electric couplings, etc.
16 656 V. Bek. Device for utilising tidal power.
16 699 Brecknell Munro and Rogers (1928), Ltd., and H. J. Dolman. Receiving and exhibiting messages, etc.
16 670 British Thomson-Houston Co., Ltd. Electron discharge devices. (1/6/28, U.S.)
16 606 J. A. Crabtree and B. G. Harrison. Electrical plunger contacts.
16 674 J. Feldman. Electric amplifiers. (20/3/29, Germany.)
16 675 J. Feldman. Electromagnetic instruments. (27/3/29, Germany.)
16 678 H. H. Kalber. Electric motors.
16 726 F. J. Keene. Telephone systems.
16 691 L. Ughetti—La Corsa. Electrolyser for separation of tinfoil from salt solutions. (9/6/28, Italy.)
16 641 C. Neff. Power condenser for automatic phase regulator. (31/5/28, Germany.)
16 716 J. E. Noeggerath. Electrolytic apparatus. (21/12/26, Germany.)
16 676 J. Petrik. Thermo-electric batteries. (15/6/28, Czecho-Slovakia.)
16 643 Standard Telephones and Cables, Ltd. Switching mechanisms.
16 644 Standard Telephones and Cables, Ltd. Signalling systems. (5/2/29, U.S.)

May 31st.

16 767 A. A. Ashour. Device for rocking brushes on electrical machines.
16 841 Associated Electrical Industries, Ltd., and E. Y. Robinson. Vacuum electric tube devices.
16 864 Automatic Telephone Manufacturing Co., Ltd., J. E. Ostline and A. H. Williams. Telephone systems.
16 874 W. Bauer. Protective switch for current lines.
16 757 L. G. Brazier and Callender's Cable and Construction Co., Ltd. Device for measurement of telephone, etc., cables.
16 811 British Thomson-Houston Co., Ltd. Incandescent lamps. (31/5/28, U.S.)
16 816 D. A. Christian and Siemens Bros. and Co., Ltd. Automatic telephone systems.
16 774 A. D. Constable. Secondary batteries.
16 786 W. H. Dearden, G. Lawton, and Standard Telephones and Cables, Ltd. Magnetic materials.
16 842 G. P. Dennis. Ceiling fittings for electric lamps.
16 863 C. Gillings and W. H. Paulett. Telephone systems.
16 776 D. Glick and J. Gould. Track signalling systems.
16 748 J. P. Gumbley. Apparatus for indicating electrolyte level of accumulator, etc.
16 877 C. F. M. Hayes and Mullard Radio Valve Co., Ltd. Telephone instruments.
16 813 International General Electric Co., Inc. Electric locomotives. (1/6/28, Germany.)
16 817 A. Klanfield. Photographic, etc., arc lamps.
16 835 Kolster-Brandes, Ltd. Radio broadcasting systems. (31/5/28, U.S.)

Digitized by Google

16 878 L. L. de Kramolin. Radio receiving apparatus. (31/5/28, Germany.)
16 750 J. P. Laker. Radio receivers, etc.
16 794 J. F. P. de La Riboisiere. Electric switches.
16 777 J. H. Orr. Junction boxes for lead covered cables.
16 799 O. Schotz and J. Wagner. Electric pocket lamp pencil. (20/2/29, Austria.)
16 823 Siemens-Schuckertwerke Akt.-Ges. Starting frequency convertors. (2/6/28, Germany.)
16 783, 16 784 Standard Telephones and Cables, Ltd., and E. P. G. Wright. Automatic, etc., telephone exchange systems.
16 785 Standard Telephones and Cables, Ltd. Cable sheath. (29/6/28, U.S.)
16 782 T. G. Weavie. Electric switches.

June 1st.

16 925 Allmanna Svenska Elektriska Aktiebolaget. Electromagnetic relays. (15/10/28, Sweden.)
16 926 Allmanna Svenska Elektriska Aktiebolaget. Circuit breakers. (23/6/28, Sweden.)
16 918 W. Anderson, D. E. Lambert, E. H. Leeson, and A. Reyrolle and Co., Ltd. Electric remote control systems.
16 928 British Thomson-Houston Co., Ltd. Cases for transformers, etc. (2/6/28, Italy.)
16 880 A. E. Chapman. Current interrupters.
16 950 S. G. S. Dicker (N. V. Philips' Gloeilampenfabrieken). Device for driving gramophones.
16 951 S. G. S. Dicker (N. V. Philips' Gloeilampenfabrieken). Electric generating installations.
16 919 F. N. Linstow and A. Reyrolle and Co., Ltd. Selective indicating mechanism.
16 288 C. Lorenz Akt.-Ges. Device for influencing radiation of electric waves. (20/10/29, Germany.)
16 968 C. Lorenz Akt.-Ges. Picture telegraphy, etc. (7/6/28, Germany.)
16 952 Roessler and Hasslacher Chemical Co. Electrodes. (1/6/28, U.S.)

June 4th.

16 986 K. S. Adie. Remote control of wireless apparatus, etc.
17 086 Associated Telephone and Telegraph Co. Telephone systems. (24/12/28, U.S.)
17 038 W. E. Barber. Electric condensers, etc.
17 000 T. H. Beckett, Beckett and Wheatley, and J. D. Wheatley. Electric light fittings for ceilings, etc.
17 185 W. E. Bethell and N. E. Paine. Sealed glass envelopes for incandescent lamps, etc.
17 059 J. P. Blair. Supporting device for wireless aerials.
17 140 British Thomson-Houston Co., Ltd. Incandescent lamps. (4/6/28, U.S.)
17 141 British Thomson-Houston Co., Ltd. Protective arrangements for electric circuits. (4/6/28, U.S.)
17 152 Bullers, Ltd. Cotter pins for retaining suspension pin in insulator hoods.
17 095, 17 096 D. A. Christian, and Siemens Bros. and Co., Ltd. Telephone systems.
17 055 L. Coatalen, R. H. Rose, and Sunbeam Motor Car Co., Ltd. Ignition systems.
17 148 H. W. Cowen. Electromagnetic device for windscreen wipers, etc.
17 192 J. A. Crabtree. Electric switch mechanism. (1/3/29.)
17 180 G. W. Croot, P. J. Packman and Plessey Co., Ltd. Change-over switches.
17 136 Day and Night Novelty Ads, Ltd. Electrically-operated apparatus for advertising, etc. (20/6/28, Australia.)
17 079 S. G. S. Dicker (N. V. Philips' Gloeilampenfabrieken). Microphone.
17 080 S. G. S. Dicker (N. V. Philips' Gloeilampenfabrieken). Vertical aerials.
17 081 S. G. S. Dicker (N. V. Philips' Gloeilampenfabrieken). Amplification for electric oscillations.
17 083 S. G. S. Dicker (N. V. Philips' Gloeilampenfabrieken). High frequency amplifiers.
17 084 S. G. S. Dicker (Nederlandsche Seintoestellenfabriek). Coupling elements for volume control in wireless circuits.
16 995, 16 996 Electric Fires, Ltd., and F. L. Newhouse. Electric fires.
16 975 G. S. Foster. Electric mincer.
17 071 H. M. Genese and Pritchett and Gold and E.P.S. Co., Ltd. Vents for electric cells.
17 038 A. L. Gregory and E. Hoyle. Electric condensers, etc.
17 116 F. C. P. Henroteau. Television.
17 137 R. Horn. Preparation of electrolytic writing and drawing paper, etc. (14/6/28, Germany.)
17 103 A. M. Jacobs. Guards for electrical installations.
17 093 L. L. de Kramolin. Vacuum tube sets. (1/6/28, Germany.)
17 074 J. Liebewein and F. Pojer. Crystal detector. (4/6/28, Austria.)
16 993 J. A. MacDermid. Means for electrically controlling steering gear, etc.
17 164 J. E. Pollak (Associated Telephone and Telegraph Co.). Alternating current bells.
17 010 A. P. Rutherford. Electric, etc., lighting fittings.
17 048 Scintilla Akt.-Ges. Magneto electric ignition apparatus. (16/7/28, Germany.)
17 058 Standard Telephones and Cables, Ltd., and E. P. G. Wright. Telephone systems.
16 992 J. H. Stott. Anti-dazzle fittings for electric lamps for vehicles.
16 972 R. Sugden. Electromagnetic amplifiers.
17 126 Telefunken Ges. fur Drahtlose Telegraphie. Electric discharge devices. (25/6/28, Germany.)
16 990 P. G. A. H. Voigt. Electric sound-boxes.
17 026 R. N. Wellington. Wireless receiving sets, etc.
17 254 E. P. G. Wright. Telephone systems.

June 5th.

17 303 Akt.-Ges. Kummler and Matter. Electric heating units. (5/6/28, Switzerland.)
17 305 Associated Electrical Industries, Ltd. (Westinghouse Electric and Mfg. Co.). Circuit interrupters.
17 277 A. Bowen and British Thomson-Houston Co., Ltd. Electromagnetic gramophone pick-ups.
17 295 R. E. H. Carpenter. Electron discharge amplifying apparatus.
17 300 P. B. Cow and Co., Ltd. Portable electric lamps.
17 267 C. E. Dansie. Radio receivers.
17 276 Elektrizitats Akt.-Ges. Hydrawerke. Electric condensers. (5/6/28, Germany.)
17 292 Ferranti, Ltd., F. W. Taylor, and E. E. Wild. Voltage regulation of transformers.
17 206 E. Hanff. Lighting equipment of motor vehicles.
17 242 H. Leben and A. Reyrolle and Co., Ltd. Electric protective systems.
17 300 E. Nesbitt. Portable electric lamps.
17 232 Portable Talking Pictures, Ltd. Sound and talking film synchronising devices.
17 237 C. E. Prince and Radiovisor Parent, Ltd. Operation of light sensitive devices.
17 254 Standard Telephones and Cables, Ltd. Telephone systems.
17 260 H. J. Thomson. Control of electro-mechanical variable speed gearing.
17 219 T. F. Wall. Electromagnetic testing of wire ropes.
17 299 Western Electric Co., Ltd. (Bell Telephone Laboratories, Inc.). Electrical conductors.

June 6th.

17 462 J. E. Allan. Motor control. (15/3/28.)
17 463 J. E. Allan. Motor control. (24/8/28.)
17 464 J. E. Allan. Motor control. (18/12/28.)
17 465 J. E. Allan. Control of air supply for motors, etc. (15/3/28.)
17 466 J. E. Allan. Control of air supply for motors, etc. (18/12/28).
17 381 Associated Electrical Industries, Ltd. and T. W. Ross. Alternating current directional relays.
17 382, 17 383 Associated Electrical Industries, Ltd., and T. W. Ross. Electric protective systems.
17 406 Automatic Telephone Manufacturing Co., Ltd., O. A. Pearce and L. M. Simpson. Telephone systems.
17 437 British Thomson-Houston Co., Ltd., D. H. Graham and H. J. Taylor. Dynamo-electric machines.
17 438 British Thomson-Houston Co., Ltd. Electric arc devices. (6/6/28, U.S.)
17 439 British Thomson-Houston Co., Ltd. and G. S. C. Lucas. Thermionic valves.
17 402 Cambridge Instrument Co., Ltd., and W. J. Stallan. Magnification of small movements.

The kVA Charge in Two-Part Tariffs.

ALTHOUGH there is in some quarters a tendency to assume that the tariff question is rather overdone at the present time, we do not subscribe to that view, and as recent contributions in these columns have shown, we feel that the subject is even now of sufficient importance and interest to merit treatment from various points of view. In the not far distant future the question of charges for supplies from the "grid" will assume interesting shape for many power supply engineers. While it is impossible at present to visualise in detail the complexity of the charges that will eventually be devised, not only for stations taking a partial supply, but also for those taking the whole of their requirements from the "grid," it is obvious that the last word has not been said on the question of tariffs for this purpose. In anticipation of the "grid" methods of tariff framing a kVA charge is considered to be a probability, and, in view of this, particular interest attaches to Mr. E. V. CLARK'S article on a later page of this issue, in which special attention is devoted to the problem of charges for "grid" supplies. One of the objects of the article is to determine whether a tariff wherein the standing charges are based partly on kW peak and partly on the wattless component of that peak has possibilities of proving a satisfactory one in practice. Although the author makes a good case for the theoretical tariff which he has evolved, he frankly admits that it has practical defects, not the least of which is that where power factor at present is bad, it would offer such immediate inducement for power factor correction that it would encourage far more capital expenditure on plant for this purpose than permanent conditions would warrant. Mr. CLARK, however, thinks a compromise might be arrived at by means of a normal tariff with standing charges based on peak in kVA, to cover undertakings whose peak-load power factors fall within certain limits, coupled with rebates to those whose power factors fall outside this range. Some complexity would arise in metering on this system, but with large amounts of power involved, metering equipment costs would be practically negligible. Readers having helpful views to offer on Mr. CLARK'S thoughtful contribution are invited to communicate them through our correspondence columns.

The Humble Iron.

THERE are still in this country many power station engineers who persistently decline to interest themselves in developing the domestic load, some because they cannot see in it a sizeable load, others because they are afraid of its poor load factor. Those in the second category only need to be shown how their fears dissolve before a determined attempt to increase the period of use by pushing the sales of appropriate apparatus, in conjunction with suitable tariffs, but the first category is not so easily converted. "What," they ask, "is the use to us of a few electric irons, and things of that kind?" An investigation recently completed by the Statistical Research Department of the National Electric Light Association of America furnishes an instructive reply to this question, for the survey showed that, averaging the energy consumption of flat irons at 6 kWh per month, the domestic flat irons of the U.S.A. consumed in 1928 over one billion kWh. This was twice the quantity of electricity supplied by the electric light and power companies to all the electrified railways in the States. Compared with other domestic appliances the flat iron consumption was twice that of the domestic refrigerators, five times that of vacuum cleaners, and six times that of mains-operated radio sets. More interesting still is it to find that while the flat irons consumed 1 044 000 000 kWh, electric cookers used 31 500 000 kWh less, and that electric fires only consumed 52 000 000 kWh, against 153 900 000 kWh used for radio sets. Even in the States, where, in 19 077 000 homes there are approximately 14 500 000 electric irons in use, the future of the despised flat iron is full of promise, for these wired homes represent only two-thirds of the total number of houses, and the electric iron is only found in three-quarters of them. Thus, in 50% of American homes there is no electric iron.

An Electrical Exhibition.

THE question: Why do not we have an annual or biennial British Electrical Exhibition on a scale comparable with the Motor Show? is one that must often occur to many members of the industry. It has been put in these columns, and in those of more than one of our contemporaries, but so far these questionings do not appear to have disclosed any reasonable objection, and apathy alone seems to be the main obstruction. In course of time, perhaps, constant reiteration of the question may provoke serious consideration with a view to definite

Digitized by Google

action. The latest attempt to discover why we have no Electrical Exhibition is made in Messrs. Henley's "Distribution of Electricity," which bases its request on dissatisfaction with the facilities at the British Industries Fair, and the growing interest in all things electrical. We agree as to the public interest, but we feel that our contemporary, in common with many people in the industry, does not view the B.I.F. in quite the right perspective. It was, we believe, designed as a purely trade fair to appeal to overseas customers. In recent years, however, the organisers have taken such elaborate steps to arrange visits by the various home associations, and have apparently done so little to encourage the attendance of foreign buyers that the comparatively widely held view that the Castle Bromwich B.I.F. is a home trade show is quite understandable. We maintain that as an exhibition for home trade purposes the B.I.F. is for many reasons unsuitable, and that while it is so regarded there will be little enthusiasm for a real British Electrical Exhibition in London. If, on the other hand, the purpose of the B.I.F. is definitely confined to the improvement of overseas trade—and success in this direction implies a change in date—there should be no difficulty in organising a big electrical exhibition appealing to the home trade and to the general public of Britain. The Faraday celebrations and other events planned to take place in 1931 mark that year as a great one in the electrical world. There is time now to organise an Electrical Exhibition for 1931—if anybody wants one.

Country House Fires.

SOME of the effects of the educational campaign undertaken nearly a year ago by the National Register of Electrical Installation Contractors are becoming visible in the daily Press, and a notable illustration of the effectiveness of this propaganda is seen in Press paragraphs commenting on the eighteen country house fires which have occurred this year. Instead of the bald statements about "fused electric wires," the papers when referring to a fire presumed to be of electrical origin are careful to point out that "in the early days of electricity there were no strict rules, and the wires in a country house were encased in wood or rubber, which rotted with age," or some such explanatory reference. The fire insurance companies, too, seem to be showing more interest in the wiring question. One company informed a newspaper man that they were now insisting on examining the wiring before they would insure a country house, and that they required from the wiring contractor concerned a certificate showing that the work had been properly carried out. With such a certificate they have no hesitation in insuring the house at an ordinary premium, and they "feel easier about a house with electric light where the wiring has been properly done than when there is gas." But where the installation is not up to standard an extra premium is required. References of this sort are of definite service to public and electrical installation engineers alike, and will do much to help in the eradication of faulty wiring.

Economic Rural Service.

THE problem of supplying electrical service to scattered rural districts is occupying considerable attention in this country, and farmers who see transmission lines passing near or over their property do not always realise that, despite its nearness, the cost of transformation prevents the supply authority from giving them a service. The American General Electric Co., however, claims to have overcome the obstacles by means of new and simplified apparatus, which, without sacrificing safety or reliability, lacks several of the expensive parts of the conventional sub-station. After a rural load has been developed with the new equipment, a larger station can be installed, or an existing distribution system extended to that district from a distant point, whereupon the original sub-station equipment can be used in developing another rural section. Instead of the usual oil circuit breaker, relays, current transformer and disconnecting switch, there is substituted a combined disconnecting switch, fusible cut-out and current-limiting resistor unit. This high-speed interrupting device protects the high voltage line against interruption resulting from faults in the step-down transformer, sub-station structure or distribution lines. The transformer is single-phase, oil-insulated, self-cooled, and of the outdoor type. It may be of 15, 25 or 50 kVA capacity. One end of the high-voltage winding is permanently grounded to the tank; the other end is brought out through an oil-filled bushing. The insulation throughout the new type of small-capacity high-voltage sub-station is so designed that its strength against lightning voltage is greater than that of the high-voltage line itself, thus protecting the station. The sub-station is designed for use on 66 000 V lines having an earthed neutral that is solidly and permanently earthed at every power source. It is so made that it will not affect the operation of the high voltage line because of transient over-voltages, overloads or short circuits.

A Pertinent Question.

IN our correspondence columns this week a correspondent asks the pertinent question, "Where are the 'electrics' of yesteryear?" Up to the time of the war increasingly large numbers of electric vehicles were being put into service and central station engineers in particular were buying "electrics" for departmental transport purposes. As we pointed out in a recent issue the Ministry of Transport's returns of new vehicles coming on to the road shows a remarkably small percentage of electric vehicles. There must surely be some important factor holding up progress in this field, and though we do not pretend to be able to diagnose the trouble, we think that time spent in finding answers to the questions of "Battery Electric" will not be spent unprofitably. A necessary preliminary to location of the obstacle or obstacles is to discover what has happened to the many electrics which have gone out of service in recent years, and why they have been discarded. We shall, therefore, be glad to hear from any of our readers, and particularly from power station engineers, who can give enlightenment on this matter.

The Glareless Light Campaign.

WE are glad to see that the slogan, "Glareless Light Preserves the Sight," is to be the basis of a vigorous campaign which will be conducted on national lines throughout the coming lighting season. The strides made in improving lighting efficiency during the past few years have been very encouraging, but there are still many installations which, though adequate so far as luminous intensity is concerned, cause visual discomfort due to glare. Those of us who are in intimate touch with the pulse of the lighting industry, know that in glare we have one of the greatest brakes on development, since it limits the intensities of artificial illumination which can be installed, and thus tends to paralyse progress. Anything, therefore, which can be done to combat glare will automatically widen our markets. The lamp manufacturers have already taken a decisive step in the direction of glareless light by offering special inducements to the purchase of "pearl" and "opal" type lamps, and the E.L.M.A. Lighting Service Bureaux are embarking on a campaign still further to popularise those types. During the autumn months, class periodicals throughout the country will contain informative articles dealing with electric lighting in general, supported by display advertisements, and stressing particularly the necessity of using pearl and opal lamps wherever possible, on the score of eyesight preservation. Trade journals will similarly boost the importance of glareless light, and stress the value of good lighting in commerce. Instructive and informative publications dealing with glareless lamps are in course of preparation, and will be available for distribution to the public by supply undertakings and retailers. During September and early October lecture-demonstrations will be held in different parts of the county to ensure that all sections of the electrical industry are conversant with the "Glareless Light Campaign."

THE KVA CHARGE IN A.C. TWO-PART TARIFFS.

Part II.—Some of the Possibilities of a New Tariff Based Partly on the kW Peak and Partly on the Wattless Component of that Peak.

By EDWARD V. CLARK, B.Sc., M.Inst.C.E., A.M.I.E.E., M.I.E.Aust.

IN the first part of this article (THE ELECTRICIAN, August 2, 1929), it was deduced that, subject to a number of assumptions, of a kind largely inseparable from the logical establishment of any two-part tariff, the ideal standing charges attributable to a consumer on an a.c. system depend partly on his peak in kilowatts, and partly on the wattless component of that peak; and may be expressed by the formula $£P(Y + Z\cos\theta)/Dp + Q\,Z\sin\theta/Dq$, where P represents the consumer's peak load in kW, Q the lagging wattless component of that peak in kVA, θ the phase angle on the system at the time of its peak load, Dp and Dq the diversity factors of power load and wattless component respectively, $£Y$ the revenue necessary per kW of the station peak to meet the annual charges on that part of the power station whose capital cost may be deemed dependent on capacity in kilowatts, and $£Z$ the revenue necessary per kVA of that peak, to meet the annual charges on that part of the system whose capital cost may be deemed dependent on capacity in kVA.

It was further shown that the ratio of unit charges for wattless component and power component—that is, the ratio of $Z\sin\theta/Dq$ to $(Y+Z\cos\theta)/Dp$,—might be expected to have a range from say 0·2 to 0·8 in different circumstances, being largely influenced by the peak-load power factor of the supply authority. The graph Fig. 1, repeated herewith, shows how this ideal standing charge compares with that based directly on peak load in kVA for consumers of different power factors on systems having this ratio at various values from 0·2 to 0·8.

This theoretical principle being established, the object of the present section is to determine whether a tariff wherein the standing charges are based partly on kW peak and partly on the wattless component of that peak has possibilities of proving a satisfactory one in practice. As in Part I, running costs are entirely ignored, as being outside the scope of the article.

Metering Problems.

A form of tariff must be of limited application unless the requisite meters can be obtained in reliable form and at reasonable prices. The natural suggestion for metering on this tariff would be to instal one maximum demand indicator recording in kilowatts, and a second to record in wattless kVA. Both these instruments, with provision for ignoring overloads of short duration, are readily procurable. But though satisfactory where plain induction motors alone were installed, the use of two separate meters would fall short of requirements in many cases where appreciable phase correcting apparatus was in use. As seen from the formula or from the graph, a consumer taking leading current at the time of his peak load is entitled to a rebate in his standing charge; but evidently this rebate does not necessarily depend on the maximum reading of a wattless component indicator designed to record leading current, since with condenser correction this occurs at time of no load, as also it may with synchronous motors. With some kinds of corrected induction motor, the current taken is lagging at low load, but leading at high; so that even with a wattless demand indicator which recorded both maximum leading and maximum lagging component, there would be nothing to show what reading should be taken in levying the standing charge. It is evident, therefore, that for consumers such as these the two instruments should be combined so as to give a composite reading.

"Biased" Maximum Demand Indicator.

It was shown by the writer* that by adjusting the two elements of an ordinary three-phase watt hour meter so that one if operated alone on a single-phase circuit would run a certain percentage fast, and the other an equal percentage slow, the meter will record accurately on balanced load with sinusoidal wave the total units consumed, plus or minus any desired fraction of the wattless kVA-hours consumed; the relation being that if the elements run respectively x % fast and slow, then the meter records the kW-hours $\pm x/\sqrt{3}$ % of the wattless component, the sign depending on the connection of the instrument with respect to phase sequence, and also on whether the wattless component is lagging or leading.

* "J.I.E.E.", Vol. 64, June 1926.

Similarly, an indicating three-phase wattmeter appropriately biased will indicate at any moment the kW load plus or minus any desired percentage of the wattless component of the load; and hence, if designed as a maximum demand instrument, will give what is required. There is, therefore, no difficulty in providing a single indicating meter from whose reading the consumer's proper standing charges may be directly taken; though there would be this serious objection that any change

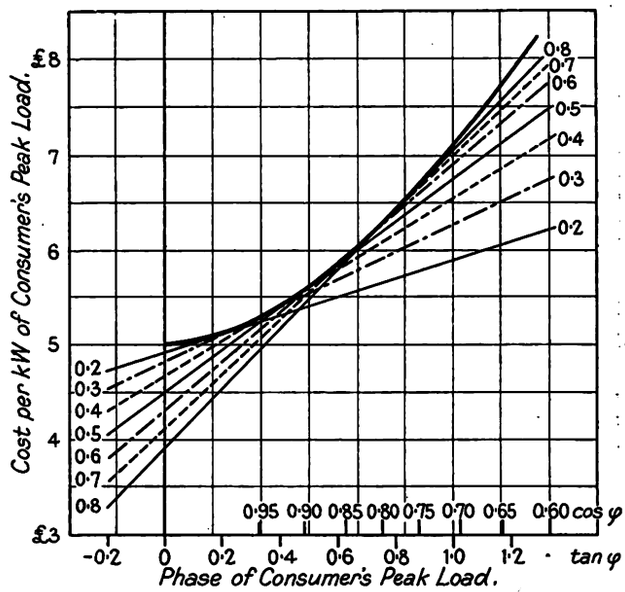

Fig. 1.—Standing Costs of A.C. supply: Comparison of kVA charge with standing costs attributable. Heavy curve represents charge per kW of peak load on a basis of £5 per kVA. Straight lines represent standing costs attributable with ratio cost per wattless kVA/cost per kW ranging from 0·2 to 0·8, each line being tangential to the kVA curve.

in the relative charges for power component and wattless component would neeessitate the readjustment of every meter.

Single-Phase M.D. Indicator for Three-Phase Supply.

If a three-phase maximum demand indicator of the above type is used, and the two elements adjusted to read 100% high and low respectively, then this will record the maximum demand in kW plus or minus 58% of the simultaneous demand in wattless kVA. But evidently, a meter element which is adjusted to be 100% low must at all times be inoperative, and thus may be omitted. Consequently, on a system where the conditions are such that the charge for wattless component should be about 58% of that for power component, a suitable instrument for recording consumers' standing charge is a single-phase maximum demand indicator, recording in kilowatts, connected the series coil in one main, the pressure coil thence to another main with due regard to phase sequence, and scaled to read 100% high. Thus comes the unexpected result, that various undertakings which now use a three-phase kVA maximum demand indicator as a basis on which to levy their standing charges, might use instead a suitably connected single-phase kW indicator, with a nearer approach to the ideal charge.

Practical Considerations.

However, it does not appear to the writer that the adoption of this basis for computing consumers' standing charges, whether by the biased three-phase or the single-phase indicator, is advisable in the case of any supply authority whose conditions are such that the kVA basis is a reasonably fair one for the normal consumer; since although the charges $(Y+Z\cos\theta)/Dp$ per kW of peak load and $Z\sin\theta/Dq$ per wattless kVA of that peak have been shown to be rational for different consumers upon the same system, their values expressed in terms of money only remain correct so long as θ, the peak-load phase angle on the station remains constant. Any improvement in the power factor of the system means an increase in $\cos\theta$, and a decrease in $\sin\theta$; and hence requires an increase in the tariff per kW and a decrease in that per wattless kVA.

Digitized by Google

Now, with a tariff on this basis, the bonus for phase correction extends not only to unity power factor, but also to highly leading power factor; and wherever a tariff of this kind assessed the wattless component at half the cost of the power component or more, the financial benefit to the consumer of installing a large bank of condensers would be very great. Consequently, the adoption of a tariff of this type would certainly tend to such speedy improvement of power factor, that within a year or two at the outside, it would need revision.

A further point of considerable importance is this. The straight lines in Fig. 1 representing costs with various relationships of wattless kVA to kW charge were drawn tangential to the common kVA curve, and were not intended to have any direct relation to one another. Nevertheless, if we take an undertaking having a very poor peak-load power factor, and other conditions such that the 0·8 tariff line is appropriate; and then, other conditions remaining unchanged, imagine that the power factor steadily improves, so that the ratio of the charges becomes in turn 0·7, 0·6, etc., we find that the appropriate tariff lines are very close to those drawn on the figure.

Hence, any improvement in power factor beyond that on which the tariff in use was based would mean that those with good power factor no longer pay sufficient in standing charges, and those of poor power factor too much; and the improvement in power factor must mean that the former class preponderates.

It therefore follows that, even though new consumers keep the plant and mains fully loaded, any material improvement in power factor beyond that for which the tariff in use was based would require an immediate adjustment of tariff rates, or the financial returns of the undertaking might suffer a marked decline.

On the other hand, where an undertaking operates on a suitable tariff of the kVA basis, no improvement of power factor can be seriously detrimental to its finances, provided the normal growth of the undertaking suffices to keep the distribution system adequately loaded, despite the better power factor.

Nevertheless, in those cases where a tariff based on kVA is palpably unsuitable, a tariff of the type suggested, the standing charges metered either with separate kW and wattless kVA maximum demand indicators or with a biased indicator, might prove satisfactory. If using two meters, the wattless indicator should record lagging current only; and the method would be reasonably sound for all consumers who made no attempt at phase correction, or who corrected to some extent by means of condensers; though, as has already been pointed out, it would tend to overcharge those who corrected by types of apparatus which gave good power factor at full load, but not at low.

With use of the biased demand indicator, the consumer would receive a rebate if taking leading current at time of peak load; but the amount of rebate would hardly be sufficient to warrant an abnormally large bank of condensers, and the supply authority might protect itself by the stipulation that where leading current was habitually taken it reserved the right to add a kW indicator to the metering equipment, and charge upon that or the biased indicator, whichever were the higher.

Naturally, where the power factor of a system is already good, there is less prospect of its improvement than where it is poor; so that the ratio of charge per kW and per wattless kVA being once determined, there should be no risk of an early change being necessitated.

Bulk Supplies.

Where a large concern, in addition to its normal load, gives supplies in bulk to a number of small distributing authorities, a tariff on the kVA basis is only likely to be rational for such supplies if the peak-load power factors of the distributors are fairly high. Whatever the nature of the other load upon the bulk-supplier's system, the ratio of the ideal wattless kVA charge to that of power will be fairly low, since the capital charges of distribution will not be borne by the supplier. Consequently, if the purchasing authorities' power factors at their peaks have a range only from say 0·95 to 0·85, the kVA charge may hold the scales of justice fairly true; but any such authority who developed a large induction motor load, with consequent marked lowering of its peak-load power factor would be appreciably overcharged on the kVA basis; and again, any purchaser in bulk who converted to d.c., such as a railway or tramway undertaking, would have no inducement on a kVA tariff to operate at leading power factor. In cases like these, a biased maximum demand indicator and corresponding tariff might prove useful. However, in many cases, the conditions of bulk supply are better met by a tariff in which the standing charges are based on the peak load contracted for, rather than on the maximum demand, as they usually require a special transformer station, and frequently special mains; and then meters are needed chiefly as a check that the stipulated peak is not being greatly exceeded, and as a guide for determining when the time has arrived for its increase. For such checking purposes, if graphic instruments were not warranted, it would be well to instal meters recording both kW and total kVA peaks, since the contracted maximum load would doubtless be specified as at not less than a named power factor.

Supplies from the Grid.

The ultimate condition of supply in Great Britain when the Electricity Commissioners' "grid" extends through a great part of the country is hard to visualise. Tariffs to those undertakings which are encouraged to retain existing generating stations to assist in carrying their peak loads will undoubtedly be of a complex nature, if the most economic mutual assistance between base load stations and such auxiliary but less efficient stations is to be afforded; and it is useless to touch upon them here. But there will be a vast number of smaller undertakings which will draw the whole of their supplies from the "grid," and these may be expected to differ markedly in power factor, according as they are chiefly industrial or residential in nature.

Despite the great extent of the "grid" as planned, one may expect that the ratio of the ideal charge for wattless component to that for power will not be high, since there will undoubtedly be much capital spent on the steam ends of the main stations, in striving after high thermal efficiency; and it may be expected, too, that the peak-load power factor of the system will be kept up by alternators now coupled to steam turbines in non-selected stations being retained for use as synchronous condensers. It would seem therefore that a tariff with the standing charges based on peak load in kVA, as has apparently been suggested, will prove unduly harsh on undertakings whose peak load power factor is low.

It would appear that national economy, apart entirely from any academic striving after theoretical justice, will require that the cost of supplying low power factor energy from the "grid" should be determined with some degree of accuracy, and tariffs framed accordingly. For it may mean a very considerable waste of money to the nation, if each comparatively small distributing authority should find that on the tariff offering it pays to go to considerable expense in installing local plant for the improvement of power factor, when the national benefit derived from such phase improvement might be secured at much less cost by greater concentration of the requisite plant.

As pointed out in Part I of this article, kVA loads are to be added vectorially, and this fact is ignored in the kVA tariff. With increasing loads, owing to the diminishing unit cost of apparatus with size, and the lessening importance of wages, it becomes increasingly profitable to improve power factors, and for the same reasons it is more economical to overcorrect at some places and leave uncorrected at others than partially to correct at all.

Yet the kVA tariff markedly encourages partial correction, and discourages any attempt at correction to the neighbourhood of unity or beyond. This certainly is the most vital defect of the kVA charge in two-part tariffs, where large amounts of power are involved.

The "theoretical" tariff evolved in this article also has serious practical defects, chief of which undoubtedly is that where power factor at present is bad, it would offer such immediate inducement for power factor correction that it would encourage far more capital expenditure on plant for this purpose than permanent conditions would warrant.

A possible compromise might be a normal tariff with standing charges based on peak in kVA, to cover undertakings whose peak-load power factors fell within certain limits, coupled with rebates to those whose power factors fell outside this range. If, for example, those who correct their power factors considerably have the benefit of a rebate based on the line marked 0.2 on Fig. 1, they would have some inducement to correct up to the neighbourhood of unity or even beyond, if conditions were such that they could correct at little cost; while if those of low power factor who did not correct at all received a rebate based on the line marked 0.5, they would in many cases realise that correction for them was unjustifiable. A rebate, far more than the main tariff,

Digitized by Google

may be regarded as a thing to be adjusted from time to time as circumstances may dictate; and no hardship would be entailed if it were stipulated that such rebates were liable to annual or periodic revision, in accordance with the conditions upon the Commissioners' lines, nor would there be any incongruity in having different rebates in different parts of the country.

Metering on this system would involve a little complexity; but with large amounts of power, cost of metering equipment is negligible. For all undertakings kVA and kW maximum demand indicators would be desirable; and where the power factor was low, the rebate might be calculated from the readings of these, though the provision of a wattless kVA indicator would give greater accuracy, and enable the standing charges inclusive of the rebate to be taken direct from the instruments. For those of high power factor, a biased indicator or its equivalent would be necessary, to enable the actual conditions of the peak load to be determined.

BOOK REVIEWS.

Electrical Engineering Problems. Part II. Alternating Current Circuits and Apparatus. By J. G. PERTSCH, JUNR. (London: McGraw-Hill Publishing Co.) Pp. 105. 7s. net.

Since this book—a companion to "Electrical Engineering Problems. Part I—Direct Current Circuits and Apparatus," by the same author—was written, Prof. Pertsch lost his life in saving the life of another while swimming in a lake.

Those who are familiar with Part I will recollect that the purpose of the work is to provide a classified series of concrete problems for the benefit of students wishing to practice their application. In order to stimulate interest, the problems have been designed to typify actual engineering practice wherever possible.

The problems are divided into chapters devoted to alternating voltage and current; effective value; sinusoidal voltages and currents; power in alternating-current circuits; inductance; inductive and capacity circuits; single-phase transmission line; alternator construction and polyphase electromotive forces; three-phase relations; power measurement in polyphase circuits; three-phase transmission line; alternator characteristics; the synchronous motor; power factor correction; transformer relations and connections; polyphase induction motor; induction motor startors and controllers; and alternating current projects.

Theory and Design of Electrical Machines. By F. CREEDY. (London: Sir Isaac Pitman and Sons.) Pp. xvi + 349. 30s. net.

Mr. Creedy has a reputation for giving his readers something in advance of current thought and practice, and his latest effort is a notable example of foresightedness. Realising that the possible types of dynamo-electric machine are almost endless in number, he attempts in the present work to classify these possibilities in such a way as to indicate fresh lines of advance. To map out the necessary permanent lines of future advance before they are realised in practice would obviously save time and money which would otherwise be spent in developing apparatus lacking the fundamental advantages of other possible types. Such ordered progress has hitherto been considered impossible, but Mr. Creedy not only believes it to be possible, but proceeds to show how it can be carried out. In explaining his method he starts from the most abstract point of view, where the general machine is treated merely as a special case of Maxwell's general equations of the electromagnetic field. He then gradually introduces limitations, one after the other, with a critical explanation of the functions and necessity of each limitation of generality, thereby dividing the machine into different classes, which are then described in detail. He thus ensures that practically all possible types are described in principle, thus leaving only the permutations and combinations of individual parts to be developed as occasion requires.

By the author's principles of classification he divides the machines into six classes: (1) fundamental types without commutator or variable pole pitch; (2) commutator motors operating from fixed frequency generators; (3) machines operating from variable and multiple frequency generators; (4) cascade sets of various types; (5) multiple polarity machines (including cascade machines and machines with multiple polarity windings in general); and (6) variable polarity apparatus, in which the speed of a motor or the frequency of a generator is changed by changing the number of poles. As there are great gaps in our knowledge of classes 4, 5 and 6, a large part of the book is devoted to an attempt to fill them up.

The author contends that by developing, by theoretical criticism, a number of solutions to each problem in a form suitable for experimental trial, the development of electrical apparatus might be reduced to a scientific form instead of being left to the haphazard efforts of individual inventors. At first glance this attempt at rationalisation of design sounds impossibly idealistic, but sufficiently general methods of design are described in Part VI of the work to render it possible to carry out a critical comparison of the possibilities of different types in advance of experiment. While some special problems, such as the relation of the leakage coefficient to the different pole combinations in the internal cascade machine, remain, the author's methods of designing serve to throw their existence into relief, so that experimental research can be concentrated on them.

Mr. Creedy claims above and beyond these applications, that the main advantage of these methods of design is that they separate the use of engineering judgment from the necessity of numerical calculation so that this latter may be handed over to a calculating machine operator without engineering knowledge, and the whole of the drudgery of designing lifted from the engineer's shoulders. The book is one which cannot fail to provoke thought along new lines, and careful study of its pages is definitely to be recommended to all who are interested in the theory and design of electrical machines.

Public Cleansing: Collection Treatment and Utilisation of Town Refuse. By THE "JAMES JACKSON" STUDY CIRCLE OF THE BIRMINGHAM CORPORATION SALVAGE DEPARTMENT. (London: Ernest Benn, Ltd.) Pp. xix+251. 18s. net.

Written by sixteen present or past members of the Birmingham Corporation Salvage Department, under the general supervision of Mr. James Jackson, the general manager, this volume is intended to fill the need for a complete text book for those sitting for the examinations of the Institute of Public Cleansing. Besides the legal and administrative aspects the practical side of the cleansing service is dealt with from all angles.

It is interesting to note in the chapter on methods of transport that, contrary to the generally accepted view, experience at Birmingham has not only proved that the horse cannot compete with mechanically propelled vehicles on the longer hauls, but also indicates that the superiority of the horse is challenged even on short hauls. Tests were carried out with two 2-ton electric vehicles specially designed for the purpose of contesting the previously accepted sphere of horse drawn wagons, and in addition to a lower loading line, the electrics possessed greater carrying capacity than the horse wagons. These electrics were put to work in areas previously cleared by horse-drawn wagons, and during the twelve months ended June, 1928, they proved superior to horse wagons on all counts. The test results showed:—reduction in total expenses, 8·43%; increase in weight collected, 3·29%; increase in visits made, 5·5%; reduction in men days worked, 14·38%. Needless to say these tests have led to the adoption of a policy of gradual replacement of the horse transport. Experience at Birmingham with a fleet of 86 electric vehicles has shown them to be extremely reliable, the percentage of running efficiency obtained being 93 in the year 1928.

There is a very concise section on the generation, distribution and utilisation of electricity for power and lighting purposes at refuse disposal works, and there is a practical chapter on electric vehicles. In the first part batteries of both the lead plate and Edison types are examined. Then follows a passage on charging methods, and the chapter ends with a short section on motors and controllers.

LARGE WATER-COOLED TRANSFORMERS.

Some Unusual Features and Proportions in a 33 000 kVA 145 000 V Bank—Overcoming Transport Difficulties.

AMONG recent transformer shipments from the Metropolitan-Vickers works is a 33 000 kVA bank of water-cooled high voltage outdoor transformers for the Parahyba power station of the Brazilian Hydro-Electric Co., Ltd. These transformers, which are illustrated in the accompanying photographs, have a number of interesting features, especially with regard to the provision of water-cooling for such large units, and the unusual proportions of the units necessitated by the requirements of transport within the restricted loading gauge of the railway to the site.

The Parahyba power station is situated on the Parahyba River, about 100 miles north-east of Rio de Janeiro. The new transformers are to constitute the third three-phase bank, and will operate in conjunction with a third 33 000 kVA generator. The output of the three generators will be stepped up by the transformer banks and transmitted approximately 95 miles over three high tension circuits in parallel to the Cascadura sub-station, where the system is linked with lines from the Lages power station.

The transformers have been designed to operate in parallel with two existing 25 000 kVA banks supplied by the Westinghouse Co. The full winding ratio, with delta/star connection, is 6 600/145 000 V, and full capacity taps are provided on the high voltage side for 138 500 and 132 000 V, an externally operated off-load tap-changing switch being fitted to each transformer.

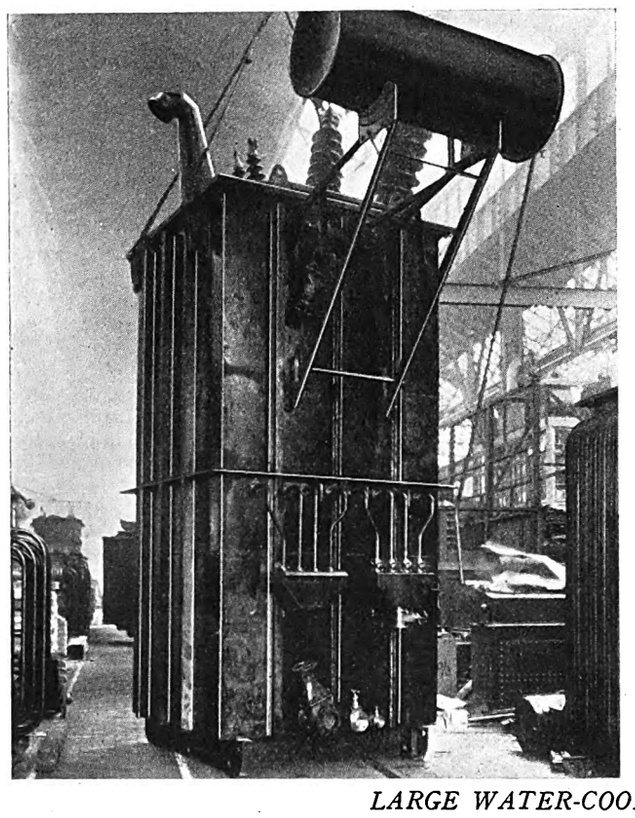
The bank is designed to operate with the high-voltage neutral ungrounded, and the windings were tested at a specified pressure of 304 600 V for one minute from the high voltage windings to the low voltage windings and earth. The high voltage bushings, which are of the condenser type, were tested at 440 kV dry, and 400 kV wet. The transformers were also subjected to a specified test consisting of a dead short circuit across the secondary terminals with the rated voltage maintained at the primary terminals for two seconds.

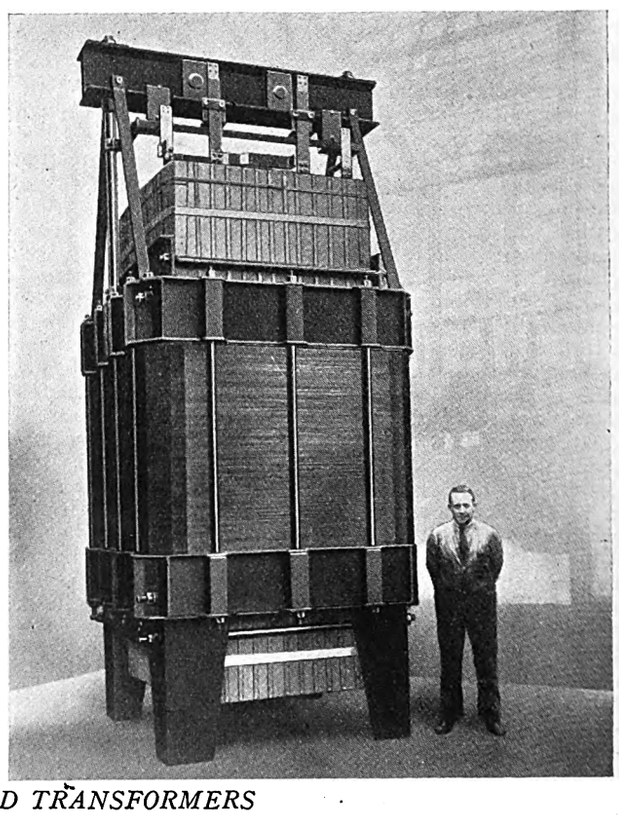
The water-cooling coil of seamless copper tubing, arranged in sections, is located inside the upper portion of the tank, and is so mounted that the transformer may be withdrawn from its tank without in any way disturbing the coil. A valve is fitted on the inlet side of each coil to regulate the flow of water, and a sight flow indicator is provided at the outlet of each coil. The flow indicators are of the bucket type, and are fitted with electrical alarm contacts so that warning is given in the event of the water supply falling below a predetermined limit. Both inlet and outlet ends of each section are arranged at the bottom so that the water may be completely drained out when necessary.

The temperature rise of the transformers at any voltage is not to exceed 55 deg. C. above the temperature of the cooling water when the supply of water is maintained at 36 U.S. gall. per min. Each transformer unit is fitted with two temperature indicators of the type in which the temperature of the hottest part of the winding is reproduced in an element, external to the winding itself, by means of a current which is proportional to the load current. In the case of one indicator of each unit, the heating current, supplied from a current transformer, flows through the metal bulb of a vapour-pressure thermometer. The bulb is mounted in the oil near the top of the tank, and is surrounded by a suitable insulating tube so that the drop in temperature between the bulb and the oil is the same as that between the main transformer windings and the oil.

The temperature of the bulb is shown in a dial indicator, calibrated in degrees Centigrade, mounted on the transformer tank. In the case of the other temperature indicator of each transformer, the heating current passes through a heating coil in which is embedded a copper resistance element, the temperature being measured by the change of resistance of the element, the latter being arranged for connection to the existing station equipment of Wheatstone-bridge type recorders, which are also calibrated in degrees Centigrade.

Owing to railway clearance restrictions in Brazil, it was necessary to limit the length and breadth of the transformer tanks, each unit being transported to site on its side. The floor space occupied is therefore relatively small and the transformers are abnormally high; the tank is approximately 8 ft. square, and the height from bottom of truck to top of high-voltage bushing is 24 ft. Each transformer, mounted in its tank, was conveyed from the Trafford Park works to the Liverpool Docks by road on a 60-ton rubber-tyred truck.





LARGE WATER-COOLED TRANSFORMERS

THESE views of some of the equipment described in the accompanying article depict (left) a single-phase unit in its tank, showing the water-cooling connections; and (right) one of the single-phase units for the 145 000 V bank.

POPULATION AS AN INDEX TO ELECTRICAL DEVELOPMENT.*

A Practical Method for Forecasting Future Demand and Plant Requirements.

By N. B. HINSON, Mem., A.M.I.E.E.

IN making plans for the future in the electrical utility business it is necessary to make estimates of future growth. Various methods have been used. The usual method is to plot growth of one kind or another against time. This gives an upward curve which is difficult to project mathematically, and usually is misleading if projected ahead more than two or three years in a rapidly growing territory.

In the electrical utility field various values have been plotted against the number of consumers or meters. This is all right for past data but for the future the number of meters or consumers would have to be estimated, and this would depend upon the increase in population, especially if all the present population now had service.

This led to the use of population as the abscissa rather than time or consumers with any of the values desired as ordinates. This gives a straight line for practically all present values, and the future is a straight line projection with a simple formula. The lower end of the line does not usually cross both zero points, and this fact gives the changing values per unit of population.

The various values at the very beginning of the industry do not give the correct trend, as only a small number of people had service, but the business is now, and has been for the last ten or fifteen years, developing very uniformly and consistently, and these later values give the correct past trend.

Population for the past, at least up to the last census date for any city, town, or county, is easy to obtain, and in many locations accurate estimates up to 1928 are available.

However, when it comes to projecting these values for ten or fifteen years into the future quite a problem arises, particularly in rapidly growing territory such as is found in numerous locations in the United States.

Raymond Pearl in his book, " Studies in Human Biology," has developed a theory of population growth which gives a curve of population for various cities and countries that describes past growth with great precision and fidelity, and predicts future growth in a more satisfactory manner than the usual method of projecting ahead with the same percentage increase as the place under consideration has had for a number of years back. This type of curve Mr. Pearl calls the " Logistic " type curve, though it has come to be known in our territory as the " Fly Curve " from one of the experiments he performed

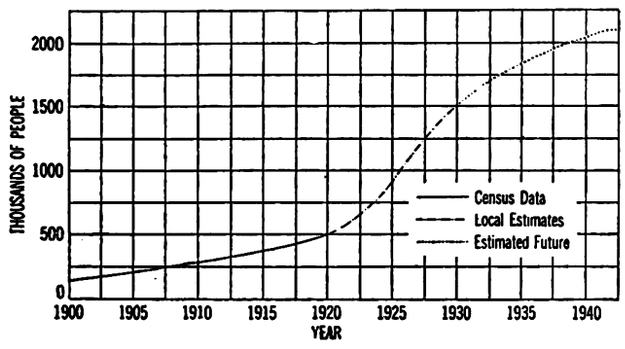

Fig. 1.

and describes in an article entitled the " Biology of Population Increase."

The population curves used for the territory which will be described were compiled from the census data for 1900, 1910, and 1920, and from estimated values of various Chambers of Commerce, local and state officials, statistical bureaux, etc. for the years 1921 to 1928. These curves were then projected ahead from the known data, the rate of growth, according to Mr. Pearl's conclusions, decreasing as the saturation point is approached. See Figs. 1 and 2.

The system on which these studies have been made is that of the Southern California Edison Co. serving in Central and Southern California. Southern California, in which most of the small towns and cities are located, is one of the fastest growing communities in America. More than 99% of all the houses in the territory covered have electric service, and this value has been more than 90% for ten years. Also the Southern California Edison Co. supplies 62% of the total kilowatt-hours direct to their own retail consumers, and 38% wholesale to other companies and cities for redistribution, and to the railways.

In considering gross revenue, kilowatt-hours generated, and kilowatt peak, the total population in the territory served

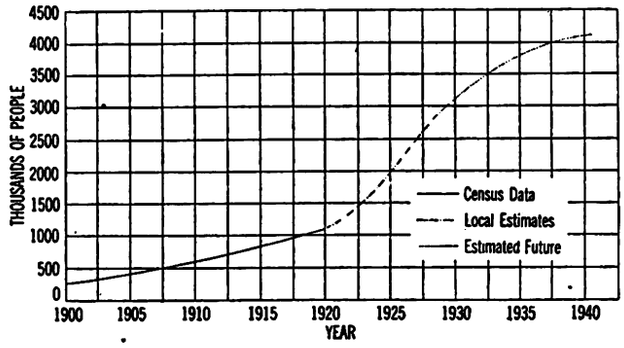

Fig. 2.

direct and indirect were used, and for horsepower connected, number of meters, and system betterment budget, the population served direct was used. These are illustrated in Figs. 3 and 4.

As will be seen, the population served is plotted uniformly, and the date at which so many people were in the territory, or it is estimated from the population curve will be in the territory, is set opposite that number of people. The values of kilowatt-hours or horsepower, or whatever is being plotted, are set opposite the year in which they occurred. These points lie in such a position that in all cases a straight line can be drawn through the group, and this line, projected ahead, gives values for the future.

Since the values for the future are dependent on population, which is an estimation, such future values for more than five years are liable to be in considerable error, but it supplies a means of getting values which can be calculated, and is much better than projecting curves which are changing their shape from year to year. Figs. 5 and 6 illustrate the same data plotted against time. This will illustrate the difference in the two methods.

Also, as additional data are available, such as the census for 1930, the population curve may change, but it is only necessary to move the date to its correct position on the various studies. In other words, the straight line values are such that they show the value when there is a given number of people, irrespective of the date on which it occurs.

The foregoing are all with regard to the system in general, and assist in forecasting so far as generation and transmission are concerned. A study was made of the load on small stations supplying cities and towns so as to be able to forecast the transformer capacity necessary in the future, particularly when new stations are contemplated, so as to instal transformers that will not have to be changed within a year or two.

These studies were started on a load density basis of kVA per square mile. These studies were made on ninety cities and towns in Southern California, ranging from 1 500 to 150 000 in population, the average being 10 000. The original study was made in 1925. This same study was made for the year 1928, using seventy cities which are incorporated, and on which it is possible to get a fairly accurate estimate at this time of population.

The maximum kVA demand for the year 1928 was used and the area in square miles of the developed territory, that is, the territory actually built up, including all vacant lots. This gave a value of kVA demand per square mile which varied from 270 to 2 700. There seemed no logical relation between areas, so the population for each city was taken and the cities grouped according to size, that is, average values

* Paper presented at Pacific Coast Convention of the A.I.E.E., Santa Monica, Calif., September 3rd-6th, 1929.

POPULATION AS AN INDEX TO ELECTRICAL DEVELOPMENT.

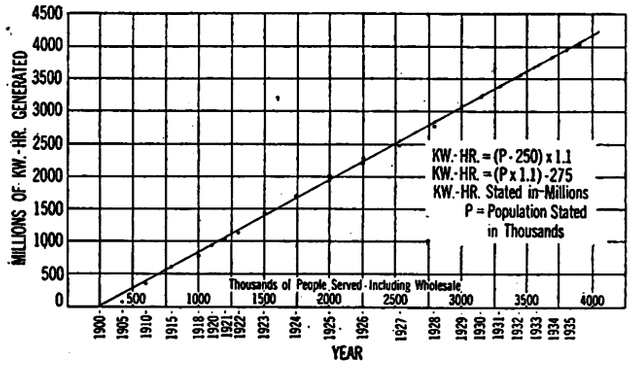

Fig. 3.

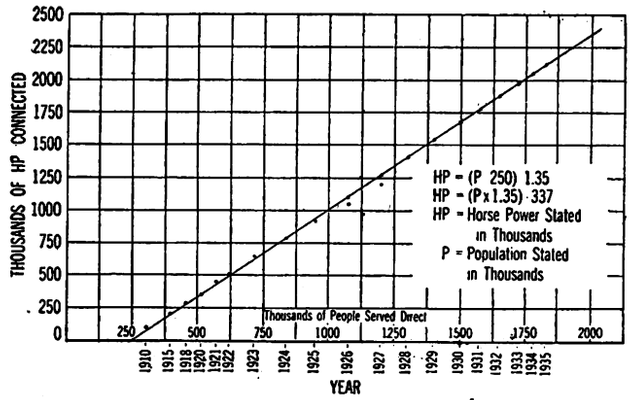

Fig. 4.

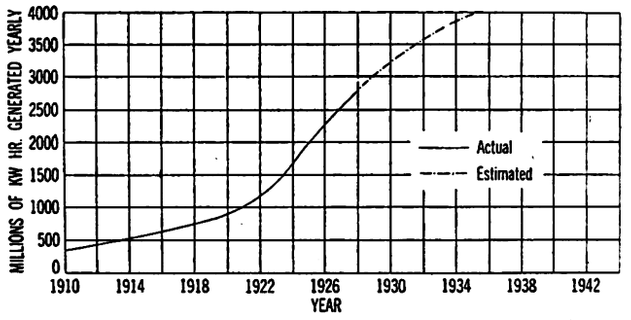

Fig. 5.

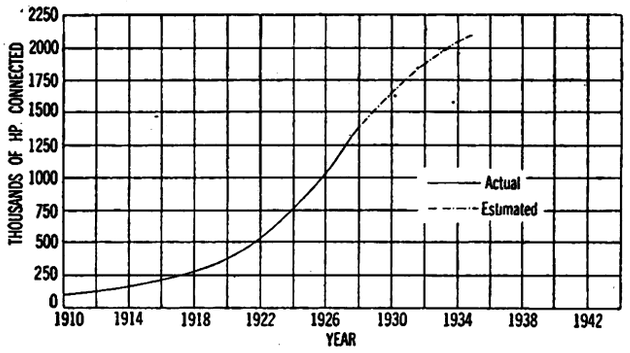

Fig. 6.

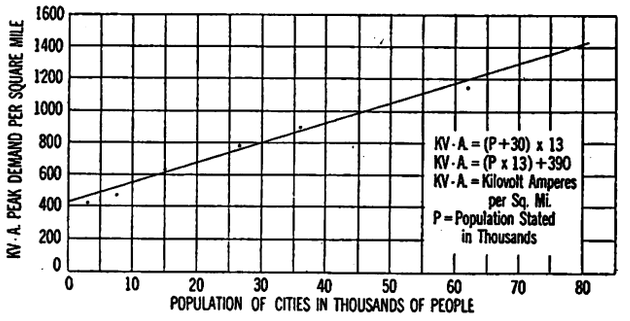

Fig. 7.

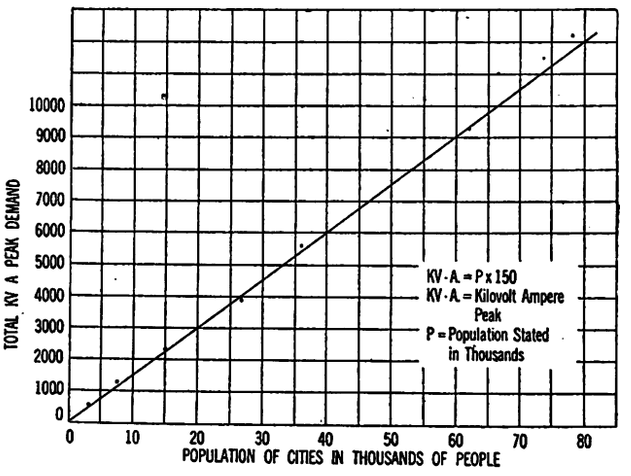

Fig. 8.

for all cities 1 000 to 5 000, 6 000 to 10 000, 11 000 to 21 000, 21 000 to 30 000, 31 000 to 40 000, and 41 000 to 150 000, the last group including only five cities.

The values of kVA per square mile for each group, plotted against the average population for each group, gave practically a straight line, as shown on Fig. 7. Spotting all seventy of the cities shows how close they follow the average. This gives a simple formula for kVA per square mile for various sized cities, and this time the developed area in square miles gives the peak demand. This has been applied to several cities for which the data are available for five or ten years in the past, and they check very satisfactorily.

These apply only to a unit city ; if two cities have combined and each had its own business district, the combined city will give values of kVA per square mile that are too high ; that is, a city of 25 000 people developed as a unit has a greater load density per square mile than two cities, each of 12 500, combined as one city. This system of future peak load projection has been used to set up the probable demand for all cities five years in the future. There has been some increase in the kVA demand per square mile during the last three years for any sized city, so that it will be necessary to check these data again after the 1930 census. However, it gives a fairly accurate check on the probable future demands.

Fig. 8 shows the peak demand of the various cities plotted against the population. This value has been increasing yearly due to the increased use *per capita* of electric energy ; it was 110 kVA per 1 000 people in 1920, 125 in 1925, and 150 in 1928. For the smaller cities the peak demand is higher due to less diversity of load. This is also seen in the kVA per square mile being lower for the smaller cities, as the development is not as uniform as the larger cities.

For making forecasts for the future no hard and fast rules will apply, and all these means are used to check, from as many angles as possible, the future value. The regular daily and monthly peak load readings on each station which have been kept for a number of years can be projected ahead as a check on future loads. The distribution system is divided into thirty-two districts with an average of 13 000 customers, the minimum being 3 000 and the maximum 50 000. Each of these districts has separate records, and is set up similar to a small company. Any data that check up satisfactorily

Digitized by Google

for all the districts may be used for such a distribution system.

From these data yearly average values of people per meter, per distribution transformer, per distribution transformer kVA rating, per pole, per mile of line, per sub-station, kVA capacity, per sub-station peak kVA, per kWh per year consumed, can be determined. These values change from year to year, but only slightly, and these changes can be determined.

These data would not be the same in various parts of the country, as the saturation is different and the character of the territory is different. Such values worked out for a particular territory enable fairly accurate estimates to be made of many of the factors entering into its electric utility business. In a territory in which practically every house has electrical service and has had for a period of approximately ten years, the various factors are perhaps more nearly related to the number of people in the city or territory.

This system of using population as a means of determining values of electrical development has been of great assistance in a rapidly growing territory, and has enabled the mathematical determination of values in the future which otherwise would be pure guesswork.

ELECTRICAL PROGRESS IN ONTARIO.

Increase of Rural Supply Facilities in the Province.

IN submitting the 21st annual report of the Ontario Hydro-Electric Commission to the Lieutenant-Governor of the Province, Mr. C. A. Magrath, chairman of the Commission says the endeavour of that body is not the concentration of industry at a few larger power sites, but rather to make as widespread a distribution of electrical energy as is economically possible. At the date of the report, October 31st, 1928, the Commission had 4 103·54 miles of rural line in operation, 956·47 miles of which were added during the preceding twelve months. The number of consumers supplied was 31 063, 12 994 of which were farms, while the number added during the year was 5 918. Arrangements are in hand for the construction of 850 miles of additional line. This development has been greatly stimulated by propaganda work, by financial assistance and by improvements, which have enabled a service to be given when three farms or their equivalent can be connected per mile of line. The growth of the total load was encouraging, though a reduction was experienced in the Thunder Bay area, owing to the shutting down of a number of large mills. The total energy generated in the twenty-two stations of the Commission was 4 104 537 584 kWh, an increase of 200 000 000 kWh, while, in addition, 236 961 050 kWh was purchased, an increase of 35 000 000 kWh. It is stated that all the stations were at times heavily loaded, the output of the Queenston station increasing by 1 000 000kWh and that of the Ontario power plant at Niagara by 23 000 000 kWh. This was rendered possible by the system of dispatching adopted, which enabled the load to be distributed, so as to secure the maximum output from the water available. Favourable water conditions played a part in the achievement of the increased output, since for the first time in recent years the stream flow was higher than normal.

THURY TRANSMISSION.

Proposed Revival of System for Hydro-electric Network in Egypt.

ACCORDING to a report in "The Electrical World," the Thury system of direct-current transmission at high tension, examples of which are to be found in France and Switzerland, is being considered in connection with the plan for transmitting hydro-electric energy from the Assouan dam in Egypt, over a distance of 570 miles.

The reason for considering d.c. transmission is that 300 000 V can be employed as the operating difference of potential, and yet the insulation need not exceed that required for 150 000 V to earth, since the middle point will be earthed.

Although nearly all of the original Thury installations are still operating, no new direct-current transmission lines have been installed for twenty years or more, three-phase, alternating current having been accepted as standard. Within recent years, Brown, Boveri of Baden, Switzerland, proposed a direct current high-tension transmission line for transmitting hydro-electric energy from Norway to Denmark, but so far nothing has come of the proposal.

SYDNEY POWER SCHEME.

Mr. Forbes Mackay to See Latest British Power Station Practice.

MR. H. R. Forbes Mackay, general manager of the Sydney (N.S.W.) Electricity Department, will, THE ELECTRICIAN learns, shortly pay a visit to Great Britain, the Continent, and probably the U.S.A.

The object of Mr. Mackay's visit is to acquire information to be used in designing the third section of the Sydney power station at Bunnerong. The first section of Bunnerong, comprising six 25 000 kW turbo-alternators, eighteen 100 000 to 120 000 lb. per hour boilers, step-up transformers and a large installation of 30 000 V switchgear, will be entirely completed before the end of the present year.

The first units of the plant have been in commercial operation since January last. In July last the station was generating at the rate of five million units per week.

To provide for the growth in demand, it has been decided to add one 25 000 kW turbo-alternator to the plant to come into commercial operation early in 1932; this turbine will draw its steam from the existing boiler house plant.

By the winter of 1933 further additions must be made to the generating plant. The shape proposed for these additions is two 50 000 kW turbo-alternators, the first to be completed in 1933, and the second in 1934, with the necessary boiler house plant, step-up transformers, e.h.t. switchgear, etc.

It is in order to ensure that the specifications covering this plant may be up to date that Mr. Mackay is undertaking his visit.

Sydney Electricity Department has grown rapidly in the last few years. The department supplies no electricity for traction, as the Government Railway Department has its own generating stations supplying the suburban railways and tramways. Nevertheless, the department sold in the year 1928 300 million kWh, and will sell in 1929 approximately 350 million kWh. It supplies electricity direct to over 170 000 separate consumers, besides giving bulk supplies to eight municipal and shire councils which have connected to their supply mains an aggregate of 17 100 separate consumers.

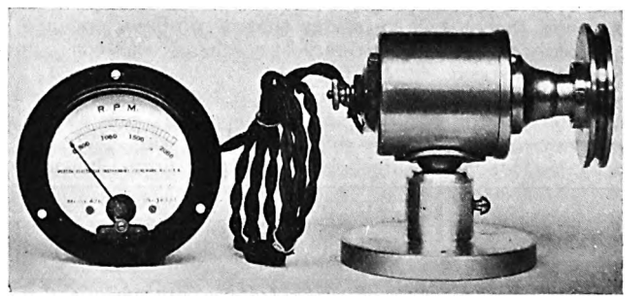
We understand that Mr, Mackay will arrive in London about October 21st, and that he may sail for America eight weeks later. His address, while in England, will be c/o Messrs. Preece, Cardew and Rider, 8, Queen Anne's Gate, Westminster, S.W.1.

SPEED INDICATION.

Greater Accuracy Claimed for Electrical Type Instrument.

THE accompanying illustration shows an electrical speed indicator, a recent production of Messrs. F. A. Wilkinson and Partners, Ltd., of Hatfield, Herts.

It comprises a small dynamo that generates a voltage directly proportional to its speed, connected to an indicating



A new electrical speed indicator.

instrument by means of a cable. It is claimed that the electrical type of speed indicator is more lastingly accurate than mechanical and other types.

The indicating instrument is of the dead-beat type made by the Weston Electrical Instrument Co., Ltd., and is calibrated in revolutions per minute which can be read at any moment without the aid of a stop watch.

The generator is driven by means of a round belt, or direct-connected to the device whose speed is to be measured.

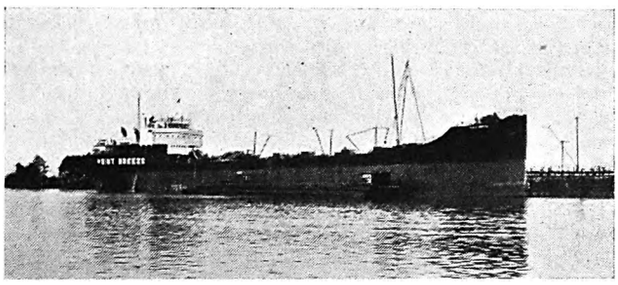
MARINE ELECTRICITY.

Sixty Electric Ships Now in the Register Book—Turbo versus Diesel Electricity—Many New Orders and Contracts—Application of Electricity to Harbour Craft—An Electrical Ship of 180 000 S.H.P.

By A. C. HARDY, B.Sc., A.M.I.Mar.E. (Author of "Merchant Ships Types," etc.).

ATTENTION was called in these notes recently to the extraordinarily rigid schedule of cruising to be undertaken during the summer months by the new P. and O. electric liner "Viceroy of India." She made in all no fewer than five cruises, totalling 22 800 miles, and only spent 24 hours in port after each cruise. She is reported by the P. and O. Co. to have completed this work without a hitch, and to have manœuvred throughout like a tug.



A big electrically-propelled tanker with a 2 550 h.p. electric propulsion motor. Two ships of this type have recently been ordered from a British shipyard.

On the completion of her cruise programme she arrived at Tilbury on August 23rd, and left for Bombay on the 30th. Thus after five cruises she had only six clear days in port for any adjustments which might be necessary to the whole of her repair plant. The indent for repairs and cleaning, I am informed, over a total running mileage of 37 000 miles in five months from her completion, consisted only of repairs to a few electrical instruments, the renewal of several broken thermometers, and the cleaning of boilers; which, it may be safely said, certainly constitutes a record for a new ship with an entirely new type of propelling machinery. This vessel has also been reported as consuming very little stores, and her consumption of lubricating oil is also light, amounting to only between 1½–2 gallons per day.

Electric Liners for Britain.

It is a well-known fact in shipping circles that the performance of this vessel during her cruise, and during her first voyage on the Bombay mail line, has been watched very jealously by many ship companies, and while in America, as might be expected, there has been, since the last article of this series was written, a very gratifying increase in the number of electric ships ordered and laid down, it is much more important to note that in this country it seems almost certain that orders will be given for two or three large electric passenger liners within the very near future. As is usual in such matters, rumour has been busy, and if such rumours are to be regarded with even a modicum of suspicion, then it is impossible to pass over the one which states that a company engaged in South American trade is to build two electric passenger liners of 25 knots speed.

It is indeed of extreme importance, because from a power, and from a propulsion point of view, the new ships will represent a considerable difference from the "Viceroy of India." This latter ship is built to steam normally at about 16 knots, and actually she is able to make about 16·5 knots, with one alternator developing about 11 600 H.P., and her two main shafts turning at just over 90 revolutions. At full speed she is able to make just over 18 knots, but, even taking this into consideration, there is a considerable jump between an 18-knot ship and a 25-knot ship in the way of power requirements, and should the rumour materialise into a definite order, then we shall have something which will be of tremendous importance to the electrical industry.

Two New Electric Tankers.

Additional interest is also given to electric propulsion in this country by the recent order of the Atlantic Refining Co. for two further electric tankers, which will be very similar to the "Brunswick" completed last year by Scotts, of Greenock, for the Atlantic Refining Co. While not of the largest type, these tankers are nevertheless definitely ocean-going ships, and will once more afford British shipowners an opportunity of examining the merits of the Diesel-electric system of propulsion. The electrical side of the order is being carried out by the British Thomson-Houston Co., of Rugby, which so far has had the greatest marine experience of any company in this country, on the propulsion side. This company then, has on order at the present time, not only the turbo-electric propulsion equipment for three ships, but also the propulsion equipment for the two Diesel-electric tankers mentioned above. In addition, new turbo-generating machinery is being built for a fruit carrier now under conversion at Belfast. A further important branch of the B.T.H. Co.'s activities is the order which they have for six equipments in which the exhaust steam from reciprocating engines is used in low pressure turbines driving generators which supply electrical power to motors on the propeller shaft, and also to further generators supplying current for electric light, heating, cooking, and other auxiliary services. The additional power thus made available for propulsion purposes, it is claimed, can be used either to increase the speed of the vessel, or to maintain the existing speed at greater economy.

All this activity surely justifies the feeling that marine electricity is now coming into its own as a definite industry, and that the electric ship is steadily occupying a position of increasing importance.

The latest edition of Lloyd's Register Book, in fact, lists some 60 all-electric ships, with a total tonnage of 259 467 tons, and when it is considered that ten years ago the electric ship scarcely existed outside the minds of a few enthusiasts (in this country at any rate) and that even the use of electricity for the many shipboard purposes to which it is now applied was relatively small, we can see, not only how important marine electricity is at the moment, but also how far it is likely to go in the near future.

Electric Ship Developments.

No longer can electric propulsion be considered entirely an American idea. Developments, it is true, are proceeding apace in that country, but this is only to be expected, because, as I have frequently pointed out, of the power and activities of the two large electrical groups in the United States of America.

Be that as it may, America is giving us some extraordinarily

RECENT ELECTRIC SHIPS BUILT, ORDERED AND COMPLETED.

Ship.	Type or Duty.	Size or Tons.	Power.	Speed.	Type of Drive.
"La Marea"	Fruit ship ..	325·2 × 48·1 × 28·3 ft.	Conversion from Diesel-electric to turbo-electric with lengthening of about 30 ft.

Digitized by Google

interesting, and almost classic electric ships. Where, for example, can you find a more economical and efficient vessel than the United States Coast Guard cutter of "Chalen" class, discussed in these notes last month? Where, too, can you find a better example to the naval architect of the way in which the marine engineer can give him just the right number of propeller revolutions to suit his propeller, his stern, and his rudder, than the arrangement of Diesel-electric propulsion adopted on the three United States Shipping Board conversions—"Courageous," 'Defiance" and "Triumph"? Some fast vessels have just been laid down for the American Ward line operating between New York and Havana, and it is understood that these will have a speed of 20 knots with about 16 000 shaft horse power.

As a designer of coastwise vessels America is well to the fore, and it may be assumed that the new ships, to which reference has just been made, will be quite high grade examples of new architecture.

Large and Small Electric Ships.

A further point may be noted in the development of electric propulsion, and that is that so far there has been very little rivalry between the respective merits of turbo-generators and Diesel-generators. It is gratifying that concentration should have been made rather on the development of propulsion than that, as a house divided against itself, the technique of electric propulsion should have been weakened by dissension between the two methods of propagating current. It would seem, indeed, that matters are settling down to a realisation that for powers of the passenger liner type the turbo-generator has a great many advantages, while for smaller vessels from, say, tankers downwards, the economy and flexibility of the Diesel engine for driving generators is becoming generally recognised, while, when we get down to small craft like tugs and ferries, the Diesel engine is practically without a rival. In the first place it can be of high speed, and therefore of light weight type. Also it can be of non-reversing type, which means that there is no need for large manœuvring air compressors and air storage bottles. In this country we still have to see a Diesel-electric tug ordered, but it is fairly certain that such will be the case before long. In Europe, generally, small Diesel-electric ships of harbour auxiliary type are definitely on the increase, and among such ships may be mentioned a 1 300 H.P. buoy and harbour duty vessel 165 ft. in length, built for the Port of Brest. This vessel has two main electric sets, each set being driven by a six-cylinder Diesel engine. Then, too, another French port has recently taken delivery of some electrically propelled and operated floating cranes, which are much cheaper to operate, and much more flexible than a corresponding steam crane.

Returning to large passenger liners, it is unquestionably plain that turbo-electricity here has much to offer, because of the fact that while in a general way two turbo-generators are fitted for normal cruising speeds, one only of them needs to be in constant use, thus cutting down the wear and tear on the machinery.

On the other hand, of course, it might be assumed that a system where the total electrical power could be split up into a large number of small units, is much better, not only for economy, but also for speed. On this latter point, of course, the Diesel-electric arrangement scores, in addition to the fact that in the largest of ships this lower fuel consumption may make a very considerable difference in the bunker space required.

Diesel Manufacturers' Activities.

Although as yet no large Diesel-electric passenger liner has been laid down, in spite of repeated rumours that the new White Star mammoth is to be a Diesel electric unit, it may be placed on record that Diesel engine building firms have not been inactive as far as the preparation of layouts are concerned. I have already commented in these notes on one layout for 100 000 H.P. Diesel-electric drive. It is interesting to note that the German M.A.N. Co. has now produced a layout for a liner of as much as 180 000 S.H.P., driven by electric motors in which there are only 16 generator sets, each driven by a 10-cylinder double-acting two-cycle engine of about 11 500 H.P.

So that, whichever way we look at the problem, or whichever way our inclinations lead us, as far as the generation of electricity is concerned, it would appear that a great deal of thought is being given to the question, and that a great deal of development work is going on.

(To be continued.)

SHIP EQUIPMENT.

Alterations and Additions to I.E.E. Electrical Regulations.

A NUMBER of alterations and additions to the second edition of the I.E.E. Regulations for the Electrical Equipment of Ships have been approved by the Council of the Institution of Electrical Engineers, and have been issued in pamphlet form.

Comparison of the old and new regulations is facilitated in the pamphlet by printing the new wording in italics.

An addition to the clause on standard pressures recognises as standard pressures 12, 50, and 110 V, d.c., on tugs, trawlers, small yachts, fishing and similar small vessels.

Switchboards are to be constructed wholly of durable, non-ignitable non-absorbent materials, and if insulating wax be used for the base, it shall be of permanently high dielectric strength and insulator resistance, and shall comply with the requirements of a specification set out in an appendix.

With regard to fusible cut-outs, the fuse shall be of such a size that it would be melted in one minute or less (two minutes or less in the case of a lead-tin alloy fuse) by a current equal to twice the rating of the smallest cable protected by it, provided that no fuse smaller than one rated to blow at 7A need be inserted in any final sub-circuit and that, for the purposes of this regulation, the current-carrying capacity on flexible cord or cable shall be considered to be equal to that of a rubber-insulated cable of equal cross-section.

Proportioning of Conductors.

An amendment to the rule relating to the proportioning of conductors allows a maximum pressure drop of 1V plus 1% of the busbar pressure for wireless mains when carrying the main and battery loads simultaneously.

Tough rubber-sheathed cable with or without braiding over the sheathing, and lead covered with or without braiding over the lead are added to the types of permitted cables. Although the use of cables insulated with varnished cambric is not recommended conditions are set out under which their use is allowed. If it is desired to use types of cables insulated otherwise than specified, sample lengths shall first be submitted for approval by the I.E.E., each sample being accompanied by a report from a recognised testing authority that the requirements of the I.E.E. as to behaviour, prospects and life of the insulating materials employed have been complied with.

Requirements for lead covered cables now provide that the sheath shall be either of commercially pure lead or of such lead alloy as shall from time to time be considered satisfactory by the I.E.E. The use of lead alloy is strongly recommended, particularly when the sheath of a cable is unprotected by an outer braiding or armouring, and the composition of suitable alloys is indicated.

With regard to the installation of cables, ventilating outlets shall be provided, preferably at their highest and lowest points, to allow circulation of air and to ensure that no water can lodge in any part of the conduit. All open ends of conduits shall be bushed, to avoid abrasion of the cable covering, and all openings shall be protected against the direct access of salt water. Cables in machinery spaces or where unavoidably exposed to the weather or to the action of sea water, shall either be lead covered with or without further protection, or be run in conduit.

In cold storage chambers cables shall be supported by clips made of porcelain, hard wood, or other non-metallic and non-hygroscopic material. Every lead-covered cable whether armoured or not, and every armoured cable, shall have its lead covering and/or armouring efficiently earthed at both ends, except in the case of such cables forming final sub-circuits, which shall be earthed at the supply end only. Effectual means shall be taken to ensure that all metallic envelopes of cables are made electrically continuous throughout their length. All earthing connections shall be effected by means of soldered joints or clamps, or alternatively by glands specially designed for the purpose of forming part of joint boxes or similar fittings in which cables terminate.

Carbon or metal filament vacuum lamps of 32 c.p. with bayonet socket caps are to be used in navigation lamps.

The rule providing that all connections within a battery room shall be either of bare metal or lead-covered cables, now applies solely to an acid battery room.

Motors essential to the safety of the ship in the event of damage shall be so installed as to be capable of running for a reasonable period after the compartment in which they are situated has been flooded.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

"Where *is* that Battery?"

[To the Editor.]

Sir,—Friend "Battery Electric" cannot see the wood for trees. He actually complains that motor cars now generally use batteries, and in consequence the battery trade flourishes.

To this extent he has apparently got his heart's desire, since it is a fact that the operation of every starter battery converts each car so equipped into a partial electric.

The judgment of the buying public on motor cars as a whole is sound. It wants the maximum possible amount of transport (i.e. useful ton-miles) out of a specific machine in a given period and at a reasonable expenditure of trouble and cash. This means the maximum safe speed and twenty-four hours' running, when desired, and while these factors may not be so important in some classes of transport as in others, I assert that they are essential and fundamental in all classes.

Certainly better and cheaper batteries would enlarge the scope of pure battery electric applications, but even as matters stand there is enormous scope for increasing the battery equipment of "stink wagons." In commercial applications, I venture to assert that a mixture of internal combustion engine with battery propulsion will ultimately supersede all other types and will cut out the "stink" just as completely as the electric crawler when used in towns.

Why not come down to earth and get busy?—I am, etc.,

August 24th. "Cynicus."

"Concrete Pole Designs and Costs."

[To the Editor.]

Sir,—It is interesting to note from Mr. W. T. Taylor's letter published in your issue of August 30th that Mr. Taylor is prepared to build a line of poles at his estimated figures. But even so, it is not an unheard of event for a contractor to lose on a contract, and until the work has actually been done and the costs verified, Mr. Taylor should be more cautious in his clalms.

Mr. Taylor also fails to deal with my point that it is possible to use wood for any span which could be dealt with by ferro-concrete. A wood pole long span line is now being erected in Mid-Cheshire. I maintain, therefore, that the pole cost is the proper basis for comparison, and not a short span wood pole line compared with a long span steel or ferro-concrete line.

I hold no brief for wood, steel or ferro-concrete, but I do know that of all the methods of construction ferro-concrete is the least adaptable to local conditions, and the most doubtful as to its cost basis and construction details. I repeat my advice to your readers—namely, that they should be very cautious when accepting a statement made in advance of even experimental construction.—I am, etc.,

W. Fennell,
General Manager and Engineer,
Mid-Cheshire Electricity Supply Co., Ltd.

"Where are the 'Electrics' of Yesteryear?"

[To the Editor.]

Sir,—Your editorial note in The Electrician dated August 9th calls attention to the return by the Ministry of Transport of licensed motor vehicles in this country, and it remarks upon these in respect of the small numbers of "electrics" as "a reproach and a challenge."

Can the Ministry of Transport state how many battery vehicles have gone out of service during the past 10 years, and give reasons other than the cheapening of the first cost of the petrol vehicle?

In other words, "Where are the electrics of yesteryear?" For there certainly have been plenty more in service than there are to-day. What is the reason for their disappearance? Traffic conditions have not changed in ten years to discount the undoubted superiority of "the electric in its field." The electric motor and controller have, if anything, improved rather than otherwise, and they certainly cannot be worn out in ten years of the class of duty to which the comparatively slow moving "electric" is daily subjected. Much the same applies to tyres, chassis, springs, etc. The trouble, therefore, must be sought in the battery.

Assuming that to be the case, the natural question arises—seeing there are two types of battery—nickel-iron-alkaline and lead-acid—whether one or both of these can be brought under the reproach of which you speak? Has the lead battery, despite the service attention it receives from its makers, completely disgusted the electric vehicle users with its incipient defects of short life, excessive weight, internal weakness, sulphation, and messy acids? Are not the lead battery makers, well knowing that the lead-acid cell is meant for stationary service, now sorry that they rushed into the traction field at all? Or has the steel-acid battery failed to justify the claims of its sponsors for long life, light weight, robust construction and guarantee of maintenance of capacity?

If the Ministry of Transport cannot tell us "where are the electrics of yesteryear," will the vehicle manufacturers state the reasons for the absence of renewal orders?

I repeat that the case for the "electric in its field" has not in any way changed, despite the enormous growth of the commercial and industrial petrol driven machine during the past ten years.—I am, etc.,

August 31st. "Battery Electric."

"The 'Circle' Movement."

[To the Editor.]

Sir,—As one of those who originated the idea of the Electric Circle movement, I am particularly interested in the editorial on this subject in your last issue.

The fundamental idea of the E.D.A. Circles is that wherever a statutory authority exists a Circle should be formed whereby all local people interested in the development of electricity throughout that area may get together, with a view to working together, rather than confusing the public by adopting competitive policies.

Whereas there are still some 640 supply authorities in this country, only 100 E.D.A. Circles exist to-day, and, as stated in your article, some of these are somewhat inactive.

I am of the opinion that the best way to initiate additional Circles throughout the country is for the manager of each supply authority to inaugurate a meeting advocating the formation of a Circle, and I think it would be very helpful if your correspondence columns were opened to a candid expression of opinion from those who have experience in the working of the E.D.A. Circles, and as to why Circles have not yet been formed in so many areas.—I am, etc.,

C. W. Sully,
Director, The Electric Lamp Manufacturers' Association of Great Britain, Ltd.

[Space in this column will be gladly afforded for expressions of opinion on the points raised by Mr. Sully.—Ed.]

[To the Editor.]

Sir,—The note on this matter in your last issue was written under a misapprehension, as the programme of this year's E.D.A. Campaign had not reached you.

This Campaign is to deal specially with the question of adequate wiring in the home, and will be known as "The E.D.A. Electric Home Campaign," while within the industry the word "Outlet" will be added to the title to show that we are following up the work which has been done by the Electrical Association for Women.

The programme of this Campaign will be circulated generally on the 10th inst.; it has been designed for operation in conjunction with E.D.A. Area Committees and Circles, and those Committees and Circles who have considered the programme have in all cases expressed their unqualified approval, and the desire to co-operate to the fullest extent possible in making this a success.

A very definite effort is to be made this year to increase the number of E.D.A. Circles with a view to operating this Campaign, and generally to increase the development work carried on by the electrical industry.

A number of E.D.A. Circles are not only in existence, but are doing excellent work for the development of electricity in their areas, and the maximum of success is being obtained where the supply undertaking, manufacturers and the contractors are working together with the greatest harmony.—I am, etc.,

W. A. Vignoles,
Director and Secretary, The British Electrical Development Association.

A MOTOR QUERY.

If the writer of the letter containing questions as to the running of electric motors, and signed "Puzzled, Manchester," will send us his name and address the points he raised will be answered.—Ed.

NEWS IN BRIEF.

Special Illumination for Sea-Fronts—Western Student's Section of the I.E.E.—Transatlantic Telephone Cables—Electric Heating at Rotherham—Liverpool's Fire Alarms.

ACCESS to the top of a new type gasholder to be built for the York Gas Co., will be by means of an electric hoist.

An electric clock, with a hand-painted dial, which was made for the basilica at the British Empire Exhibition, has been placed in Wembley Parish Church.

Rhyl Electricity Committee is drawing up a scheme of electric illuminations for the end of September and the beginning of October. The whole of the sea-front is to be lighted.

As a result of rearrangement by the Italian Administration of their telephone zones, the charges for a call from London to Turin are now 10s. 9d. (day), and 6s. 6d. (night).

It is announced that the automatic telephone system is to be installed at Cardiff at a cost of £500 000, and it is hoped later to extend the automatic system to other districts in South Wales.

The Transatlantic telephone service has been extended in Canada to Moose Jaw and Saskatoon, in the Province of Saskatchewan. The charges are the same as those to other places in the 4th Canadian zone.

The new Metropolitan automatic telephone exchange in Wood Street, Cheapside, London, E.C., was inaugurated on August 31st. Within the space of five minutes 3 300 subscribers were transferred from the manual to the dial system.

The Post Office is extending telephone facilities throughout the West Highlands. A rural automatic exchange was opened recently at Onich, and last week a similar exchange was brought into operation at Corpach. Automatic exchanges are to be opened shortly at Ballachulish and Kinlochleven.

LOOKING BACKWARD.

FIFTY years ago, according to THE ELECTRICIAN *dated September 6th, 1879 :—*

The desirability of installing electric light in lighthouses was being discussed.

The India Rubber, Gutta Percha and Telegraph Works Co.'s c.s. "Dacia" left Greenhithe to lay a submarine cable between Marseilles and Algiers. Mr. Robert K. Gray was in charge of the expedition.

* * *

TWENTY-FIVE years ago THE ELECTRICIAN *dated September 9th, 1904, stated that :*

A 10 000 line automdtic telephone exchange was at work in Chicago.

Huddersfield Corporation was experimenting in the haulage of coal on its tramways system.

* * *

FIFTEEN years ago it was stated in THE ELECTRICIAN *dated September 4th, 1914, that :*

The Board of Trade received authority to suspend patents held in this country by enemy subjects.

Nearly 10% of the total number of employees of the G.E.C. had joined the colours.

* * *

TEN years ago, THE ELECTRICIAN *for September 5th, 1919, reported that :*

Increased coal costs were responsible for many increases in charges for electrical energy.

The c.s. "Colonia" had completed the laying of a new submarine cable from Ascension, via St. Vincent and Fayal, to Rio de Janeiro.

The salary of the engineer-in-chief of the Post Office was only £1 000, rising by increments of £50 to £1 200. This scale had been operative from 1887.

With the opening, on August 30th, of the two hundredth street fire alarm box, Liverpool's system of signals at strategic points on important roads is now complete. The boxes are fitted with telephones as well as fire alarms, but in most cases the former are only available for use by the police.

The inaugural meeting of the next session of the North Western Students' Section of the Institution of Electrical Engineers will take the form of a visit to the River Dee hydro-electric station at Chester, on Saturday, September 7th, and a subsequent trip by motor launch to Ecclestone Ferry. Further particulars from Mr. D. B. Williamson, Metropolitan-Vickers Electrical Co., Trafford Park, Manchester.

The Minister of Transport has approved a scheme of improvements to be made by the Great Western Railway Co., equal in cost to the capitalised value of the railway passenger duty. The scheme, which is estimated to cost about £900 000, includes the substitution of electric for gas lighting in the remainder of the passenger train corridor coaches and some of the non-corridor coaches which at present have gas lighting.

The autumn meeting of the Iron and Steel Institute will take place in the Festival Hall of the North-East Coast Exhibition, Newcastle-on-Tyne, on September 10th to 12th, inclusive. Amongst the papers to be read and discussed is one by Messrs. E. Diepschlag and F. Wulfestieg on "Electrical Conductivity of Magnesite and Some other Refractory Materials in relation to the Temperature and their Other Properties." Additional meetings will be held at Scunthorpe on September 17th and at Birmingham on September 26th. Further particulars from the Secretary, 28, Victoria Street, London, S.W.1.

X-ray apparatus, to cost about £500, is to be installed at Monaghan County Hospital.

Watlington (Oxfordshire) P.C. has called a public meeting on September 10th, to decide whether the street lamps shall be lighted electrically.

Morecambe's autumn illuminations were switched on last week by the Mayor. Ten thousand multi-coloured electric lamps are being used in this decorative lighting, which comprises some artistic designs and which will be continued for a month.

It is stated that the committee appointed about two years ago to consider the subject of automatic control on railways will shortly issue its report.

The data of telephone development of the five largest telephone-using countries at the end of 1928 are given in the current issue of the "Telegraph and Telephone Journal." The numbers of telephones in use were: United States, 19 341 000; Germany, 2 950 430; Great Britain, 1 759 686; Canada, 1 341 219; France, 965 519. The number of telephone stations working in this country at the end of May was 1 775 870, an increase during the month of 13 246.

The prospectus of the Wimbledon Technical Institute for the 1929–1930 session (which begins on September 23rd) contains information regarding fees, and conditions of entry, a list of the teaching staff, a calendar of classes, particulars as to the days and times of classes in specified subjects, etc. There are electrical engineering (National certificate), electrical installation, special subjects (extra-electrician's certificate) and Post Office employees' (telephony) courses, as well as other engineering sections.

It has been decided to instal equipment for electric heating throughout the large technical college building now in course of erection at Rotherham. It is stated that this will be the largest building in the country heated by electricity alone.

The Tyne Improvement Commission has almost completed arrangements for establishing direct telephonic communication with vessels using its docks and staiths on the river. Direct telephone wires are to be laid from the North Shields telephone exchange to each of the five Whitehill Point staiths and the two coaling berths at the Albert Edward Dock.

The prospectus of University Courses in the Municipal College of Technology, Manchester, for the 1929–1930 session consists of 325 pages, and contains information regarding the conditions of admission of students, fees, examinations, scholarships and prizes, summaries of courses, syllabuses of classes, various associations connected with the College, etc.

The first transatlantic telephone cable, connecting London and New York by land and deep-sea lines, is now in course of active preparation, and, as reported in our last issue, the American Telegraph and Telephone Co. has completed the purchase of land in the West of Ireland for the site of the Irish terminal station. The difficulty of excessive diffusion of the signals has been overcome by the use of a new series of alloys as loading material and a new substance known as "paragutta" for insulating the conductor. It is also stated that the British Post Office has started conversations about a new Atlantic cable and is experimenting in the Atlantic with short lengths of cable designed for telegraph and telephone purposes.

PERSONAL.

MR. L. G. Griffiths has been appointed sales manager to Ultra Electric, Ltd.

Sir Hugo and Lady Hirst have left Aix-les-Bains and are travelling on the Continent. They are expected to return to London at the week end.

Mr. B. W. J. Bryan-Rennell, the London manager for Clarith Reproducers, Ltd., will as a result of a serious operation be absent from business for two or three weeks.

The late Mr. W. S. Toplis, whose association with the electrification of the Burma Oilfields was referred to last week.

Mr. H. P. Stokes, engineer and manager of Plymouth Corporation tramways, has resigned, and has accepted an appointment with the British United Automobile Services, Ltd.

Mr. Thomas A. Edison has been confined to his house, suffering from pneumonia, but a bulletin issued on Monday stated that he was out of danger, and in a convalescent stage.

After his recent serious illness, Sir Max Muspratt, a director of the Automatic Telephone Manufacturing Co., Ltd., was again able to preside over the meeting of the Finance Committee of Liverpool Corporation last week.

The marriage was solemnised at the Parish Church, Harringworth, on August 10th, of Mr. W. Collinson, electrical engineer, of Wandsworth, London, and Miss Francis Rudkin, of Harringworth.

Sir Walter Raine, president of the Association of British Chambers of Commerce, has been appointed a member of the Grand Council in Great Britain of the Empire Trade Exhibition at Buenos Aires in 1931.

The salary of Mr. Wm. Marsh, manager and engineer of the Brighton tramways, has been increased to £1 000, rising by annual increments of £50 to £1 100, and that of Mr. F. N. Hudson, deputy engineer and manager, to £525.

Ald. H. J. Galliers, the well-known Sussex electrical installation engineer, who is this year Mayor of Brighton, is playing an active part in a campaign to stop the reckless driving of cars on the London-Brighton road at week-ends.

Messrs. Owen Young, Gerard Swope, Clarke Mirior, Arthur Baldwin and J. Edmonds, have been elected directors of the Allgemeine Elektricitäts Gesellschaft, of Berlin. Mr. Young is chairman of the General Electric Co. of New York.

Sir Austen Chamberlain and Sir Laming Worthington-Evans have accepted invitations to join the board of the Greater London and Counties Trust, Ltd., which controls a number of electricity undertakings in the South of England.

Mr. J. B. Hood, who has been for some time engaged in the South Shields electricity department, has been appointed electrical engineer to Richmond (Yorks) Corporation, in succession to Mr. W. L. Wickwar, who has secured an appointment at Bingley.

Mr. I. F. Baker was recently appointed European sales manager of the Westinghouse Electric International Co., and will have his headquarters at 2, Norfolk Street, Strand, London. Until his recent appointment, his position was power division sales manager of the Westinghouse International Co., with offices in New York. Previous to this, he was acting in the capacity of managing director of the Westinghouse Electric Co. of Japan.

Mr. J. H. Whitehead, for several years lecturer in engineering science at Bacup and Rawtenstall Technical School, is taking up the duties of lecturer in electrical engineering at the Constantine Technical College, Middlesbrough. For six years he has been a transformer engineer with Messrs. Ferranti, Ltd., Hollinwood, and has been a part time demonstrator and instructor at Manchester College of Technology.

Lieut.-Col. Norman H. Firmin is leaving Newcastle to take up an appointment with the Central Electricity Board. We understand that he will be chiefly engaged upon wayleave work. Lieut.-Col. Firmin joined the staff of the Newcastle-upon-Tyne Electric Supply Co. 24 years ago, and during the last ten years has been personal assistant to Mr. R. P. Sloan, chairman and managing director. Four years ago he assumed the command of the Tyne Electrical Engineers (T.A.).

W.R.A. MEETING.

Appointment of New Chairman—Exhibition Arrangements.

AT a meeting of the Council of the Wireless Retailers' Association on August 28th, with Mr. Betambeau in the chair, a full agenda was discussed.

Mr. Betambeau reported the result of conversations he had instituted with Mr. Edgar Houghton, of the Radio Wholesalers' Federation, and Mr. J. T. Mould, chairman of the Radio Manufacturers' Association. He had tried to arrange a meeting with a view to co-operation between the three Associations, and it was almost certain that a meeting would be fixed at an early date. Mr. Betambeau mentioned that he had had an informal meeting with Mr. Mould, who had expressed himself as being in agreement with many of the W.R.A.'s objects. Mr. Betambeau again emphasised the importance of the growing membership of the W.R.A., which, he said, must be such as to compel action by the R.M.A.

Mr. Clifford mentioned a suggestion received from Mr. G. S. Wright, of Bradford, to the effect that, at the forthcoming informal meeting, arrangements should be pressed forward for the calling of a formal meeting during the National Radio Exhibition.

During the meeting, Mr. Betambeau was nominated as chairman and this proposal was seconded by Mr. Willard.

Mr. Gilbert said he was authorised by the Bucks Branch of the Association to propose Mr. Chidsey as chairman, and failing him, Mr. S. L. Wright. Upon Mr. Chidsey declining the offer, his nomination was withdrawn and Mr. Wright was proposed, seconded by Mr. Burnett. Nominations were then put to the meeting, and Mr. Betambeau was elected chairman, with Mr. Wright as vice-chairman.

Arrangements were made regarding the attendance of members at the stand which the Association intended to occupy at the National Radio Exhibition. The Council then formally accepted the application of the following new members, who had already been accepted by the Committees of the branches concerned—Bucks., ten members; Birmingham, four; and North London, twelve new members. These were accepted as members as from the date of their application. Formal approval was also given to the new Southampton Branch formed by six existing members in that area. The secretary also reported that a successful meeting had been held in Liverpool and that formal application has been received for the promotion of a branch.

Following Mr. Hornsey's resignation from the Election Committee, Mr. Betambeau was elected in his place.

The chairman then reported that application for membership had been received from certain bodies, mentioning specifically the Regent Street Polytechnic and St. Dunstan's. Both these, he pointed out, were granted preferential terms by radio manufacturers, and since these concerns did not buy for re-sale and were both established for worthy objects, he felt that a special class of membership might be created for them. The proposal was opposed—principally by Messrs. Gilbert and Turner—and it was suggested that it would antagonise other traders and would also tend to legalise what was really an illegal position. The case of multiple shops as members was then discussed, and Mr. Gilbert reported that his branch had endeavoured to enrol Curry's, Ltd. This firm had six shops in his area, and, in the absence of a Council ruling, he had offered them membership on the basis of £1 1s. for the first shop, and 10s. 6d. each for the others. As the firm had in all 200 shops all over the country, he suggested that the Secretaries invite the firm to become members at an inclusive subscription of £5 5s. From correspondence he had received he had reason to believe that such an offer would be accepted. On learning that the Secretaries had also written two letters to Curry's, the Council decided to let the matter stand over until the next meeting.

An investigation is being made in Japan to decide whether it is advisable to transfer the present Government ownership of telephone business to private enterprise. There are at present 591 800 subscribers, 2 450 exchange stations, 4 552 telephone stations and 1 800 public telephones, and a capital approaching a billion yen is needed for the transfer of the entire business. Government business is criticised to be dilatory in every direction, and the transfer to private enterprise would, it is claimed, create effectiveness and promptness in installation and service.

Digitized by Google

BUSINESS ITEMS.

MR. F. E. TAYLOR is closing down his radio business at 121, Etnam Street, Leominster.

The EPOCH RADIO MANUFACTURING CO., LTD., has removed to 3, Farringdon Avenue, London, E.C.4.

PHILIPS' LAMPS, LTD., have opened a new depot for the sale of lamps and fittings at 62, Union Street, Plymouth.

Mr. A. PILLING has removed his radio business from 27, Normandy Street, Bolton, to 177, St. Helen's Road.

The London telephone number of the SUN ELECTRICAL CO., LTD., on and after September 9th, will be: Temple Bar 3 500 (10 lines).

The telephone number of the MARCONI'S WIRELESS TELEGRAPH CO., LTD., Marconi House, Strand, London, W.C.2, has been changed to Temple Bar 4321.

The telephone number of the GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, W.C.2, has been changed from Regent 7050 to Temple Bar 8000 (70 lines).

Mr. M. R. CARLISLE has been appointed Midland agent for FERRANTI, LTD., in succession to Mr. H. S. Cooke, who has resigned. Mr. Carlisle will reside in Birmingham.

Mr. C. T. CLAPHAM, who recently took over the radio business of Mr. A. R. Aske at 53a, Hunslet Road, Leeds, has opened additional premises at 35, Church Street, Balm Road.

It is reported that the Russian Government has placed an order amounting to nearly £200 000 with SIEMENS-SCHUCKERTWERKE for equipment for the Schterovka electricity works.

Mr. W. NEWTON, electrical engineer, late of Bourbon Street and Ardenham Street, Aylesbury, has transferred his business to more commodious premises at 8, Silver Street, Aylesbury.

The registered office of the WESSEX ELECTRICITY Co. has been changed from 14, Waterloo Place, London, S.W.1, to Broad Sanctuary Chambers, 11, Tothill Street, Westminster, S.W.1.

The telephone number of Messrs. HIGGINS AND GRIFFITHS, LTD., electrical and general engineers, 21, Orchard Street, Portman Square, London, W.1, is now: Welbeck 1651 (3 lines).

Mr. James Porter Brown has retired from the firm of MARTIN AND BROWN, wireless and electrical engineers, 48, Chapel Street, Hamilton, and the business will be continued by his partner, Mr. David Hope Martin.

PERTRIX, LTD., have extended the territory covered by their agent Mr. R. C. Wood, and he is now their sole wholesale distributor in South Wales and in part of Monmouthshire. His address is 34, Windsor Place, Cardiff.

Messrs. WRIGHT BROS., who trade as the Radio Maintenance Service, have removed from 16, Wood Green Road, Birmingham, and are carrying on their business at 87, Winson Green Road and 393, Dudley Road, Birmingham. Communications to the latter address.

With reference to the notice which appeared in our last issue relative to the address of the new branch of T. BEADLE AND CO., LTD., at Nottingham, we are asked to point out that this should have read 34, Heathcoat Street, and not Heathcote, as stated.

An interesting conversion contract from gas to electricity has just been carried out in the Mossley Town Hall. Mr. S. J. HOWARD, of Mossley, executed the wiring contract, and the WHOLESALE FITTINGS Co., of Manchester, converted the existing chandeliers.

The GENERAL ELECTRIC CO., LTD., "Magnet" House, Kingsway, W.C.2, is exhibiting on Stand 21, at the Bakers' Exhibition, a double deck ½-sack electric drawplate oven. As at the two previous exhibitions, bread baking will be continuously carried out by the Aerated Bread Co., Ltd., and the bread baked will be utilised in the grill room and buffets during the period of the exhibition.

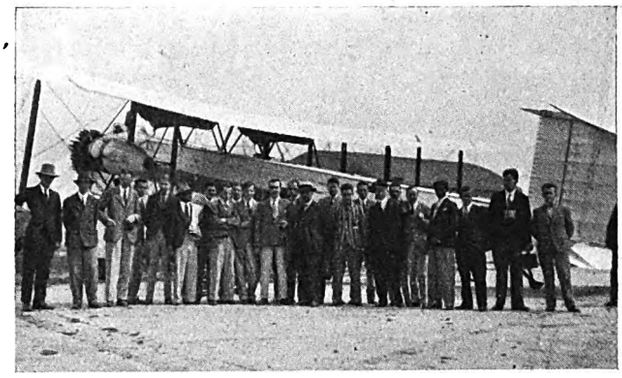
With reference to the notice which appeared in our last issue regarding the Kennington motor coach station, Philips' Lamps, Ltd,, regret that the owners of the station were incorrectly described by them as Southern Coastal Services, Ltd. The correct owners are COACH TRAVELS, LTD., under the directorship of Messrs. R. Toms and T. Boon, whilst the station goes by the name of The London Terminal Coach Station.

The GENERAL ELECTRIC CO., LTD., is engaging in a publicity campaign with new "Gecophone" products. The campaign has been subdivided into four distinct groups, i.e., a.c. mains sets, battery operated sets, loud speakers, and h.t. power units and components, and the national advertising will embrace each of them in separate channels. These advertisements will appear in daily and weekly newspapers. Sales should be greatly assisted, too, as a result of the distribution of the booklets and folders which have been prepared.

I.E.E. STUDENTS.

Tour Includes Visits to Electrical Systems in Northern France.

A PARTY of 26 students of the Institution of Electrical Engineers left London on August 3rd to spend 10 days in visiting places of electrical interest in Paris and Northern France. The week-end was spent at Malo Terminus, and on the Sunday the party went to Ostend and visited the battlefields around Nieuport.



The I.E.E. London students at Le Bourget aerodrome on the occasion of their tour in Northern France.

Monday and Tuesday, August 5th and 6th, were spent in visiting the systems laid out by the Société Bethunoise for the electrification of the rural areas around Calais and Dunkirk. After visiting the port installations at Dunkirk and a substation in the town, the party saw a 100 000 V stepdown station of the Société Electrique du Nord-Ouest and the Diesel engine generating station at Coudekerque-Branche. From here the party visited Cassel, saw a stepdown station at Hazlebrouck and proceeded to Bethune. The next day a visit was paid to the pulveriser plant at Gorsnay and the headquarters of the company at Châteaux Labuissière, returning to Bethune.

From Bethune the party proceeded to Rheims, where visits were made to the high tension laboratories of Verreries Charbonneaux, Ltd., and the cellars of Messrs. Heidsieck, where the party sampled the local products. From Rheims a trip was made to the battlefields around Berry au Bac.

Proceeding to Paris, the party visited the power station of the Electricité de la Seine Corporation at Ivry Port, on Thursday, August 8th. On Friday they were shown over the factory of the Electro Mecanique Co. at Le Bourget, and on the same day a visit was paid to the aerodrome.

Next day the party was entertained by the International Standards Electric Corporation. The research laboratories and the experimental radio station at Versailles were visited in the morning, and the afternoon was spent in visiting the factory of the associated company, Le Materiel Telephonique.

Visits were also made to the Eiffel Tower radio station, where telegraphy and telephone plant of both ancient and modern design were inspected; and to the repair shops of the Paris-Orleans Railway at Vitry. Here the visitors saw electric locomotives in every stage of déshabille.

The party returned to London on Tuesday, August 13th, after a most interesting and enjoyable tour. The success of the tour was largely due to the hospitality shown by all the firms concerned, and the trouble taken to make the visits interesting and enjoyable.

ELECTRIC PROPULSION.

Considerable publicity has been given to the successful results obtained by the P. & O. twin-screw turbo-electric liner "Viceroy of India," and it is interesting to note that the BRITISH THOMSON-HOUSTON CO., LTD., Rugby, which manufactured the propulsion equipment, has on order at the present time not only turbo-electric propulsion equipments for three other ships, but also propulsion equipments for two Diesel-electric oil tankers. The latter equipments are similar to that which the company manufactured for the Atlantic Refining Co.'s oil tanker "Brunswick," the largest Diesel-electric ship so far built in this country. The B.T.H. Co. has also on order six equipments for older vessels in which the exhaust steam from reciprocating engines is used in turbines driving generators which supply power to motors on the propeller shafts, and generators for lighting, heating, cooking, &c.

"EVER-READY" WEEK.

THE success of the "Ever-Ready Selling Week" last year has ensured a similar scheme in the sales programme of the Ever-Ready Co. (Great Britain), Ltd., for the coming season. The selling week has been fixed for October 7th-12th, as this

Illustrating the special material which has been prepared in connection with "Ever-Ready" week.

follows the change to official Winter Time, when the public begin to feel the necessity of a good torch and replacement batteries for their portable lamps and wireless sets. Window displays are a feature of the week, and the company is allocating £800 for prizes which will be distributed to the most worthy displays in the four areas as follows:—Southern Counties, London and Eastern Counties, Midland Counties and Wales, and Northern Counties, Scotland and Ireland. To each area will be allotted—(*a*) windows having a frontage of over 7 ft. and (*b*) windows of a smaller frontage—a first (£50), second (£25), and five consolation prizes (£5) in each class. Retailers only will be eligible for prizes.

Window displays must be devoted exclusively to "Ever-Ready" manufactures. The managing director of the Ever-Ready Company will be the sole judge in awarding the prizes, and it will be necessary for competitors to send a photograph of their display not later than Wednesday, October 9th, to enable the judge to visit the displays that are selected as being likely prize-winners through examination of the photographs.

During the week an "Ever-Ready" man will distribute sixty £3 notes (15 in each area) to purchasers of "Ever-Ready" goods throughout the country, and the week will be widely advertised throughout the country. A large quantity of display material is available, and this may be arranged according to personal tastes and requirements.

AMERICAN DIESEL ENGINE MANUFACTURERS' ASSOCIATION.

REALISING the need for closer contact with each other and with the problems of the user, a group of the leading manufacturers of Diesel engines in the United States have formed the Diesel Engine Manufacturers' Association, with offices at 30, Church Street, New York, N.Y. Twelve of the leading builders, representing practically the entire output of Diesel engines in the United States, are responsible for the organisation. The association states as its primary object the advancement of Diesel power in America and a broad programme of co-operation with users of this power.

The following manufacturers are members of the association: New London Ship and Engine Works, Electric Boat Co., Worthington Pump and Machinery Corporation, Fulton Iron Works, Ingersoll-Rand Co., Fairbanks-Morse and Co., Nordberg Manufacturing Co., I. P. Morris and De La Vergne, Inc., Winton Engine Co., Cooper-Bessemer Corporation, McIntosh and Seymour Corporation, Busch-Sulzer Brothers Diesel Engine Co., Hooven, Owens, Rentschler Co.

The president of the association is Mr. Henry R. Sutphen, president of the Electric Boat Co. Mr. E. T. Fishwick, vice-president of the Worthington Pump and Machinery Corporation, is vice-president of the association, and Mr. Harlan A. Pratt, manager oil and gas engine department, Ingersoll-Rand Co,, is secretary-treasurer. The association also employs Mr. M. J. Reed as research engineer.

ELECTRIC TRACTION.

Purchase of Scarborough Tramway Undertaking—The Dublin Strike.

THE Town Clerk has reported to Scarborough T.C. in Committee the result of an interview with Mr. A. E. Hoare in London with reference to the proposed purchase of the Scarborough tramway undertaking. It was decided to inform Mr. Hoare that the difference between the price suggested and that which the Committee was prepared to recommend the Council to pay was such as to make further negotiations at this stage of no useful purpose.

As soon as a new agreement between Metropolitan Electric Tramways, Ltd., and Middlesex County Council is reached, the company will proceed with the gradual replacement of the old cars by cars of a modern and improved type. The new cars, which have been designed and are being built by the Union Construction Co., of Feltham, are low built, only one step having to be ascended before entering the car. The fittings are chromium plated, the floors are covered in cork carpet, and each car is illuminated by fifty electric lamps. There is a lobby providing standing room for short distance passengers. The equipment comprises four 35 H.P. motors, magnetic track brakes and emergency hand brakes.

The Court of Inquiry set up by the Irish Free State Government to inquire into and report upon the strike of the Dublin United Tramways Co.'s employees commenced its sittings on Monday. In a recent letter, the Ministry of Industry and Commerce expressed the view that the company, by its refusal to restore the tram services pending the conclusion of the inquiry, has acted with complete disregard of the public interest. Mr. G. M. Harris, manager of the company, in reply, says the Board is surprised that its decision should be called "a complete disregard of the public convenience," and suggests that "if that remark had been applied to those who, without reservation, declined arbitration, even though it would bring about an immediate resumption of services, it would have been more appropriate." Mr. Harris also says the Court of Inquiry still appears to the company to be insufficient justification for indefinite reversion to excessive expense which the company's financial position does not warrant.

LEGAL INTELLIGENCE.

Successful Prosecution under Merchandise Marks Act.

AT Hull Police Court, on August 26th, Henry Tattersall, trading as the Thornton Trading Co., Laurel Bank, Thornton-le-Fylde, near Blackpool, was summoned under four counts under the Merchandise Marks Act, 1887.

Mr. L. A. Byrne, who prosecuted on behalf of the General Electric Co., Ltd., stated that his clients had the sole right to use the trade mark "Osram" in this country. The defendant had sold to a firm of electrical contractors in Hull some spurious lamps which were in cartons printed with the words "Osram—Made in Italy." Evidence was given which showed that the defendant supplied half dozen of such spurious lamps in cartons wrongfully marked with the "Osram" trade mark, and that he had offered to supply further such lamps, and if need be to stamp the lamps themselves with the word "Osram." The Stipendiary found the defendant "guilty" on all four summonses, and imposed a fine of £10 and £10 10s. costs on the first two summonses, or in the alternative, 51 days imprisonment and a further £10 and £10 10s. costs, or 51 days imprisonment on the remaining summonses. Should the defendant not find the £41 for the fines and costs, the terms of imprisonment were to run consecutively and not concurrently, making therefore in all 102 days imprisonment.

Fraudulent Conversion Charge.

At the London Sessions, William James Cole, formerly a canvasser for Fulham Borough Council's electricity department was charged with fraudulently converting a sum of £8 to his own use. He visited a Mrs. Power, of Beryl Street, who signed an application form for a supply of electricity. She paid him £8, and he said the work would be done by Mr. H. A. Lever, wiring contractor. Mr. Lever said he had agreed to pay the accused commission on all jobs which he secured, but did not arrange for him to collect the money. He had not received a penny of the £8. It was stated that the department did not authorise defendant to take orders for work to be done by contractors. The accused promised to refund the £8 to Mrs. Power, and he was bound over for 12 months.

"BRIDGE-MEG" TESTER.

Portable Testing Set for Measuring Insulation and Conductor Resistances.

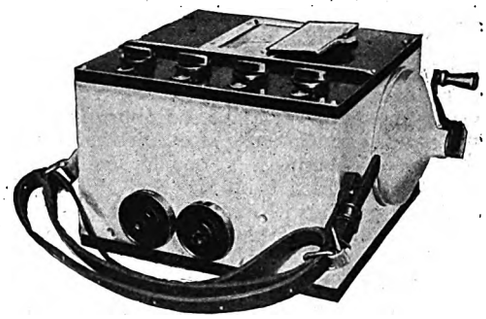
A NEW instrument, called the "Bridge-Meg" resistance tester, is being made by Messrs. Evershed and Vignoles, Ltd., at their works at Acton Lane, Chiswick, and has been put on the market this week. The instrument permits a change to be made from the "Meg" setting, used for testing insulation to the "Bridge" setting, used for measuring low resistances, by a turn of the change-over switch, without altering external connections. Just as the "Meg" insulation tester, which was introduced in 1922, does not overlap to any extent the field of utility of the "Megger" testing set, (the former not being supplied for testing at pressures above 500 V or with scale maxima above 100 MΩ) the new "Bridge-Meg", which bears the same relat on to the "Bridge-Megger" as the "Meg" bears to the "Megger," is a useful addition to the company's products, especially as its price is about half that of the "Bridge-Megger."

The new set is a combined ohmmeter and generator built into one case with a set of adjustable resistances, and by the turn of a single switch it serves for measuring high resistances or for determining conductor resistances by the Wheatstone bridge method.

For insulation tests the change-over switch is set to "Meg," the two terminals connected to the lines (or line and earth), the handle turned at about 150 r.p.m., and the reading taken directly on the scale in ohms or megohms. A test takes from 5 to 10 seconds. For low resistance measurements by "Bridge" method, the change-over switch is set to "Bridge," and the two terminals connected to the resistance under test. The handle is turned, while the resistance knobs (and if necessary the ratio switch) are adjusted until the pointer stands at the infinity mark on the scale, showing that balance has been obtained. The value in ohms of the resistance measured is shown by the figures appearing under the windows, multiplied or divided by the factor shown by the ratio switch. A measurement can easily be made in 15–30 seconds.

The range of resistance readings is continuous from 100MΩ down to 0·01Ω (100 MΩ to 10 000 Ω on "Meg" and 999 900 Ω to 0·01 Ω on "Bridge"). For testing insulation one must set to "Meg," turn the generator handle, and read the resistance on the scale in megohms or ohms. For testing low resistance (conductor) it is necessary to set to "Bridge"; turn the generator handle, adjust for balance (infinity reading on the scale), read under windows and multiply or divide by factor on the ratio switch. The result is in ohms.

The ratio switch is of the plate type, and has two arms sliding between two sets of studs. The ratio corresponding to a given setting is indicated externally by engraving on the handle. The adjustable resistances are of novel design, and, while considerably lighter and smaller than those employed in the resistance box of the "Bridge-Megger" set, are equally efficient in their operation. There are four sets of adjustable resistances: units, tens, hundreds and thousands, giving values from 1 to 9 999, in steps of one unit. The value corresponding to a given setting of the dials can be read by numbers seen through small windows in the case.

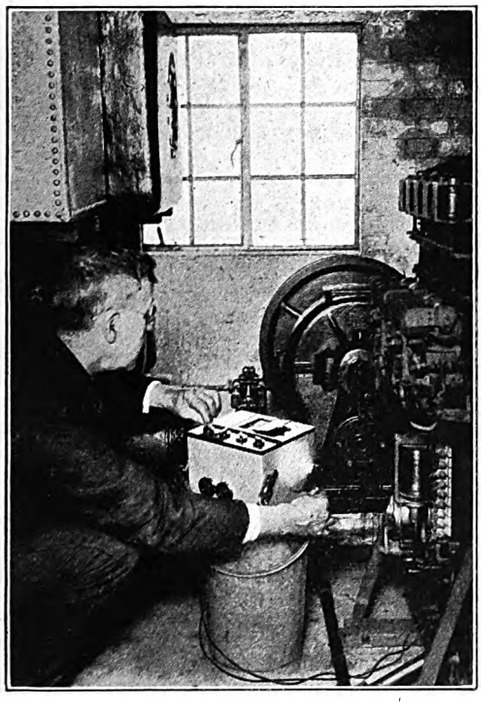


The Bridge-Meg may be carried in one hand or slung from the shoulder, leaving the hands free.

The generator is a self-contained unit. It has two windings connected in series for tests of insulation, and in parallel for bridge measurements, the voltage generated being 500 for meg tests and about 250 for bridge tests. The drive is transmitted from the turning handle to the armature through steel cut gears enclosed in an oil-tight casing. A free wheel interposed between handle and armature allows the latter to come to rest slowly when the handle is released, so that it is impossible to damage the generator by stopping it suddenly. A constant-speed clutch of simple design is also interposed between the handle and the armature shaft, so that the speed of the armature remains constant whatever the rate at which the handle is turned above the speed at which the clutch slips.

With regard to the construction of the ohmmeter movement, the moving-coil element is mounted on an axle pivoted in spring-supported jewels carried in a cast aluminium frame, which also directly supports the dial plate. An index adjuster is provided, operated by a small screw accessible from the outside of the case. This is a simple device, by means of which the field surrounding the pressure coil can be slightly distorted by movement of a small piece of soft iron. The index adjuster has no physical connection with the moving-coils, the control being entirely magnetic, and cannot therefore be used to injure the instrument.

This new set, which weighs 12¾ lbs., should prove useful in many industries where electrical apparatus has to be installed or maintained, as it is easy to operate and gives the desired results quickly.



Testing lift control gear with the Bridge-Meg.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, where available.

EDINBURGH CORPORATION, September 7th.—Electric lighting installation in 52 dwelling houses at Featherhall, Corstorphine. Specifications, etc., from the Engineer, Electricity Department, Dewar Place, Edinburgh; deposit £1 1s.

HARROGATE CORPORATION, September 7th.—Supply and erection of overhead 11 000 V lines and 346/200 V lines. Specification, etc., from Mr. Neil McLean, borough electrical engineer, 33, Swan Road, Harrogate.

SCARBOROUGH CORPORATION, September 7th.—Supply and erection of e.h.t. and l.t. overhead lines (spec. 8/29); and supply of e.h.t. and l.t. paper insulated cable (spec. 9/29). Specifications, etc., from Mr. E. J. Jarvis, 89, Westborough, Scarborough.

ARBROATH INFIRMARY, September 9th.—Electrical work, in connection with extension of buildings. Schedules, etc., from Messrs. Clark and Blyth, 4, Herald Buildings, Arbroath.

Electrical Fittings.

BRIGHTON GUARDIANS, September 9th.—Supply of electrical fittings, etc., to the Institution and to Warren Farm Schools. Forms of tender from the clerk, Mr. H. Burfield, Princes Street, Brighton.

CHARLTON KINGS CLUB, September 9th.—Electric light installation. Specification from the Steward; deposit £10.

KETTERING URBAN DISTRICT COUNCIL, September 9th.—Supply of h.t. armoured cable. Specification from Mr. W. A. Walker, Electricity Works, Kettering; deposit £1 1s.

LONDON COUNTY COUNCIL, September 9th.—Supply and erection of e.h.t. switchgear, etc., for tramways sub-stations. Specifications, etc., from the General Manager of Tramways, 23, Belvedere Road, S.E.1; deposit £2.

LOUTH CORPORATION, September 9th.—(1) Mains and street work, and (2) sub-station equipment. Specifications from Messrs. Burstall and Monkhouse, 14, Old Queen Street, Westminster, S.W.1; deposit £3 for each contract.

NEW MILLS URBAN DISTRICT COUNCIL, September 9th.—Electrical equipments, including e.h.t. and l.t. switchgear, transformers, transformer kiosk, e.h.t. and l.t. cables, feeder pillars, etc. Specification, etc., from the clerk, Mr. D. Bennett.

OLDHAM GUARDIANS, September 9th.—Electrical lamps and fittings. Particulars from the clerk, Mr. F. W. Fletcher.

WEST RIDING EDUCATION AUTHORITY, September 9th.—Electric lighting installation at the Sanatorium, Bingley Training College. Specification from the Education Officer, County Hall, Wakefield.

ISLINGTON (LONDON) GUARDIANS, September 10th.—Six months' electrical supplies. Forms of tender from the clerk, Mr. Albert King, St. John's Road, Upper Holloway, N.19; stamped addressed envelope to be sent.

LEXDEN AND WINSTREE GUARDIANS, September 10th.—Electric light installation at the Children's Homes, Stanway. Particulars from the master, Mr. A. H. Gosling.

LIVERPOOL CORPORATION, September 10th.—Electric power and lighting installation for new abattoir, Stanley, Liverpool. Specification, etc., from Land Steward and Surveyor, Municipal Buildings, Liverpool; deposit £3 3s.

SLEAFORD URBAN DISTRICT COUNCIL, September 10th.—Supply and laying of 500 yards of four-core, 0·5, and 500 yards of four-core, 0·06 armoured cable, with necessary boxes. Specification from Mr. W. H. Wilson, Electricity Works, Sleaford.

BROMLEY (KENT) CORPORATION, September 11th.—Electric wiring of 63 houses on Southborough estate. Particulars from Mr. Harold Cliffe, borough engineer; deposit £1 1s.

CENTRAL ELECTRICITY BOARD, September 11th.—Supply, delivery and erection of 132 kV overhead transmission lines (approach to Clarence Dock, Liverpool). Specification (No. N.W.E.-P.L.3) from Mr. R. H. Fox, secretary, Trafalgar Buildings, Charing Cross, London, W.C.2; deposit £2 2s. for first copy, and £1 1s. for each subsequent copy.

CROYDON GUARDIANS, September 11th.—Six months' supply of electrical fittings and appliances, etc. Forms of tender from the Clerk, Mayday Road, Thornton Heath; stamped, addressed envelope to be sent.

STOKE-ON-TRENT CORPORATION, September 11th.—Replacement of (1) four superheaters, and (2) two economisers for water-tube boilers at the central power house, Hanley. Specifications from the City Electrical Engineer, St. George's Chambers, Kingsway Stoke-on-Trent; deposit £2 for each.

COMMISSIONERS OF HIS MAJESTY'S WORKS, ETC., September 12th.—Supply and erection of an electric passenger lift at Natural History Museum, South Kensington, London, S.W. Specifications, etc., from Contracts Branch, King Charles Street, London, S.W.1; deposit £1 1s.

REIGATE CORPORATION, September 12th.—Supply, laying, etc., of 1 800 yards of 0·2 sq.in. h.t., concentric, paper-insulated, lead-cove e1 and armoured cable. Specification, etc., from Messrs. Handcock and Dykes, 11, Victoria Street, Westminster, S.W.1; deposit £2 2s.

DUNDEE EDUCATION AUTHORITY, September 13th.—Electric lighting work in connection with erection of new Primary School at Rockwell, Lawton Road, Dundee. Specifications, etc., from Messrs. Allan and Friskin, 26, Castle Street, Dundee.

LEYTON CORPORATION, September 13th.—Electric light installation at Canterbury Road Schools. Particulars from the architect, Mr. John H. Jacques, 61, West Ham Lane, Stratford, London, E.; deposit £1.

WORKSOP GUARDIANS, September 13th.—Re-wiring Kilton Hill Infirmary. Specifications from Mr. J. Haslam, Ryton Chambers, Bridge Street, Worksop.

BELFAST CORPORATION, September 16th.—Overhead travelling cranes, for the electricity department. Specification (W. 95), etc., from Mr. F. H. Whysall, city electrical engineer and manager, East Bridge Street, Belfast; deposit £2 2s.

EDMONTON GUARDIANS, September 16th.—Six months' supply of electric lamps. Forms of tender from the clerk, Mr. E. Ridley, 77, Bridport Road, Edmonton, London, N.18; stamped addressed envelope to be sent.

HOLBORN (LONDON) GUARDIANS, September 18th.—Six months' supply of electrical fittings. Forms of tender from the Clerk, 53, Clerkenwell Road, E.C.1; stamped, addressed envelope to be sent.

WARRINGTON GUARDIANS, September 21st.—Twelve months' electrical supplies to Whitecross Institution, Warrington, or Cottage Homes, Padgate. Tenders (separate for the two places), to Mr. Arthur Bottomley, clerk, Union Offices, Museum Street, Warrington.

SALFORD CORPORATION, September 23rd.—Supply of 10 000 kVA, 33 kV/6·6kV transformers for outdoor service. Specification from the City Electrical Engineer.

COMMISSIONERS OF H.M. WORKS, ETC., September 24th.—Steam generating set, control panel and modification of existing electric generator, at the State Institution, Rampton, Retford. Specification, etc., from the Contracts Branch, H.M. Office of Works, King Charles Street, London, S.W.1; deposit £1 1s.

STAFFORD COUNTY EDUCATION AUTHORITY, September 26th.—Electric light and power installation in new wing of Wolverhampton Grammar School. Specification, etc., from Messrs. Moffett, Rosher and Mann, Union Chambers, Temple Row, Birmingham; deposit £3 3s.

EAST LOTHIAN EDUCATION AUTHORITY, September 27th.—Electrical work in connection with erection of public schools at Longniddry and Aberlady. Forms of tender, etc., from Messrs. Morham and Brotchie, 29, Hanover Street, Edinburgh.

Overhead Lines.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, September 27th.—Supply and erection of a double circuit, 33 000 V, three-phase, 50 cycle, overhead (steel towers) transmission line. Specification (No. 33/T/1), from Mr. E. F. Hetherington, chief engineer and manager, at the offices of the Authority, Phœnix Buildings, Dudley Road, Wolverhampton; deposit £1 1s.

METROPOLITAN ASYLUMS BOARD, October 2nd.—Installation of electric bells at Paddington Casual Ward (Contract No. 6): new storage battery for t.s. "Exmouth" (No. 7); and alterations to electric lighting in "X" block at Eastern Fever Hospital (No. 8). Specifications from the Board's Office, Victoria Embankment, E.C.4; deposit £1 for each.

HALIFAX CORPORATION, October 7th.—Electricians' work in connection with erection of filter house, etc., for the waterworks department. Specifications, etc., on and after September 16th, from the Borough Engineer; deposit £2 2s.

HACKNEY (LONDON) BOROUGH COUNCIL, October 9th.—One 30 000 kW C.M.R. turbo-alternator and exciter, etc.

in connection with electrification of Madras suburban services. Specifications, etc. (£1) from the company's offices, 91, Petty France, Westminster, S.W.1.

SOUTH INDIAN RAILWAY CO., LTD., September 20th.—Electrical control and traction equipment for suburban services. Specifications, etc. (£1, not returnable), from the Company's Offices, 91, Petty France, Westminster, S.W.1.

AUCKLAND ELECTRIC POWER BOARD, September 23rd.—Supply of pilot cable and joint boxes. (Reference B.X. 5 643.)

EGYPTIAN MINISTRY OF THE INTERIOR, September 23rd.—Electric light installation and distribution system for the town of Kafr-el-Cheikh (Gharbieh Province). (Reference B.X. 5 502.)

INVERCARGILL (N.Z.) CORPORATION, September 23rd.—Supply and delivery of switchboard, to be directly operated and suitable for controlling 11 000 V, three-phase, 50-cycle current, it may be either of the draw-out truck type or totally armour clad, and will at first consist of seven units. (Reference B.X. 5 507.)

Generating Plant.

SOUTH AFRICAN RAILWAYS AND HARBOURS, September 23rd.—Crude oil engine-driven 150 kW electric generating plant. (Tender No. 1 528.) (Reference B.X. 5 566.)

INDIA STORE DEPARTMENT, September 24th.—Supply of 31 000 yards of dry core electric cable. Schedule (No. 4) (5s.) from the Director-General, Belvedere Road, London, S.E.1.

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, September 24th.—Supply of condensers (schedule C. 461.) (Reference B.X. 5 488.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, September 26th.—Two 100 kVA motor-alternators (tender No. 1 521). (Reference B.X. 5 564.)

DURBAN CORPORATION, September 27th.—Supply of three-phase ironclad, compound filled switch panels (specification S.778). (Reference B.X. 5 505.)

EGYPTIAN MINISTRY OF THE INTERIOR, September 28th.—Supply and erection of electric power station for the town of Samaunoud (Gharbieh Province). (Reference B.X. 5 596.)

EGYPTIAN MINISTRY OF THE INTERIOR, September 28th.—Machine tools, Diesel and semi-Diesel engines, boilers, electric batteries, etc., for the Prisons Administration. (Reference A.X. 8 245.)

MARLBOROUGH (N.Z.) ELECTRIC POWER BOARD, September 28th.—Supply and erection of 600 B.H.P. Diesel-driven generating plant and switchgear. (Reference B.X. 5 556.)

COMPANHIA DOS CAMINHOS DE FERRO PORTUGUESES, September 30th (extension of time). — Signalling apparatus. (Reference A. 8 427.)

EGYPTIAN MINISTRY OF THE INTERIOR, September 30th.—Supply and erection of electric power station, with overhead and underground networks, for the town of Deirout. (Reference B.X. 5 598.)

STATE ELECTRICITY COMMISSION, VICTORIA, September 30th.—Supply and delivery of three 3 000 kVA 50 cycle, oil immersed, self-cooled, outdoor type single-phase transformers and spare coils and bushings. (Reference B.X. 5 523.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, September 30th.—Twelve months' supply of electric lamps (tender No. 1 526). (Reference B.X. 5 590.)

VICTORIAN ELECTRICITY COMMISSION, September 30th.—Three 3 000 kVA transformers and spares. (Reference B.X. 5 523.)

VICTORIAN ELECTRICITY COMMISSION, September 30th.—Supply, erection and maintenance of coal conveying plant. Specification (No. 29/68) from the Agent-General, Victoria House, Strand, London, W.C.; deposit £2 2s.

WELLINGTON CORPORATION, September 30th.—Electric motors, starters and switchgear, for the Milk Department. (Reference B.X. 5 508.)

EGYPTIAN MINISTRY OF THE INTERIOR, October 1st.—Erection and equipment of electric power station (about 500 kVA), with overhead and underground networks, for the town of Menouf. (Reference B.X. 5 567.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, October 1st.—Supply of electric lamp standards. (Reference A.X. 8 251.)

POSTS AND TELEGRAPHS DEPARTMENT, MELBOURNE, October 1st.—Supply and delivery of switchboard cords. (Reference B.X. 5 515.)

NEW ZEALAND POSTS AND TELEGRAPHS, October 1st.—Supply of bolts, brackets, screws, springs, etc., for British Post Office No. 121 wall telephones and No. 2 receiver switch. (Tender No. P. and T., 151/1 700.)

EGYPTIAN MINISTRY OF THE INTERIOR, October 2nd.—Supply and erection of electric power station for Dessouk Town (Gharbieh Province). (Reference B.X. 5 597.)

VICTORIAN RAILWAY COMMISSION, October 2nd.—Supply of a.c. line relays for power signalling. (Reference B.X. 5 563.)

SOUTH AFRICAN POLICE, October 3rd.*—Supply of electric torches, etc. (local indent No. 50). (Reference C.X. 3 118.)

BULAWAYO MUNICIPALITY, October 4th (extension of time).—High tension overhead lines, with appurtenant gear and step-down transformers; pumps and motors with starters, etc. (contract No. 6/29). (Reference A. 8 462.)

SOUTH INDIAN RAILWAY CO., LTD., October 4th.—Supply of convertor equipment for sub-stations (specification No. 6); transformer switchgear and accessories (No. 7); and overhead transmission line (No. 8). Specifications, etc., from the company's offices, 91, Petty France, Westminster, S.W.1. A charge of £1 (not returnable) will be made for each specification.

MONTEVIDEO PORT ADMINISTRATION, October 7th.—Electric trucks, for load of 1 500 to 2 000 kilos, with generating sets for charging batteries, etc. (Reference A.X. 8 353.)

VICTORIAN ELECTRICITY COMMISSION, October 7th.—Supply and delivery of 11 000 V three-core cable. (Reference B.X. 5 539)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, October 8th.—Electric ranges, radiators and water heaters, for Waitaki power scheme (section 38). (Reference B.X. 5 642.)

ANTWERP MUNICIPALITY, October 10th.—Supply of 32 portal type electric travelling cranes (cahier des charge No. 800). (Reference A.X. 8 447.)

EGYPTIAN MINISTRY OF THE INTERIOR, October 10th.—Supply and erection of electric generating station for Tala. (Reference B.X. 5 647.)

NEW ZEALAND POSTS AND TELEGRAPHS, October 15th.—Condensers (P. and T. 151/1 733.) (Reference B.X. 5 602.)

NEW ZEALAND POSTS AND TELEGRAPHS, October 15th.—Supply of B.P.O. type resistances. (No. P and T., 151/1 712.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, October 15th.—Seven 5 500 kVA single-phase auto-transformers, with accessories, for Waitaki power scheme. (Reference B.X. 5 417.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, October 15th.—Switchboard instruments, test plugs and sleeves (schedule C. 472). (Reference B.X. 5 541.)

WELLINGTON POSTS AND TELEGRAPHS DEPARTMENT, October 15th.—Supply and delivery of B.P.O. type resistances. (Reference B.X. 5 551.)

WELLINGTON POSTS AND TELEGRAPHS DEPARTMENT, October 15th.—Supply and delivery of B.P.O. type retardation coils. (Reference B.X. 5 552.)

CAPE TOWN MUNICIPALITY, October 16th.—Supply of paper insulated cables (specification No. 474). (Reference B.X. 5 640.)

EGYPTIAN MINISTRY OF THE INTERIOR, October 16th.—Electric motors, pumps, filters, and artesian well. (Reference A.X. 8 373.)

NEW ZEALAND POSTS AND TELEGRAPHS, October 16th.—Automatic wall and table telephones. (Reference B.X. 5 509.)

NEW ZEALAND POSTS AND TELEGRAPHS, October 16th.—Automatic telephone dials (P. and T. 151/1 734.) (Reference 5605.)

SALISBURY (S. RHODESIA) MUNICIPALITY, October 17th.—Turbo-alternators, steam piping, crane and switchgear (contract 52.) (Reference B.X. 5 607.)

H.T. Cables and Transformers.

SALISBURY (S. RHODESIA) MUNICIPALITY, October 17th.—Supply of h.t. cables, transformers and sundries, in connection with extensions of the electricity undertaking (contract 53.) (Reference B.X. 5 604.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, October 17th.—One 10-ton electric overhead travelling crane (tender No. 1 533). (Reference A.X. 8 463.)

WELLINGTON CORPORATION, October 21st.—High and low tension switchgear (contract No. 449). (Reference B.X. 5 649.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, October 22nd.—Supply of insulated wire (schedule C. 475). (Reference B.X. 5 580.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, October 22nd.—Telephone transformers (schedule C. 474). (Reference B.X. 5 581.)

Digitized by Google

VICTORIAN RAILWAY COMMISSION, October 23rd.—Dry-core telephone cable (contract No. 43 384). (Reference B.X. 5 638.)

MELBOURNE CITY COUNCIL, October 30th.—Two 2 500 kW motor-convertors and accessories, or two 2 500 kW rotary convertors, with transformers and accessories. (Reference B.X. 5 570.)

NEW ZEALAND POSTS AND TELEGRAPHS, October 30th.—Head receivers (P. and T. 151/1 725). (Reference B.X. 5 603.)

AUCKLAND ELECTRIC POWER BOARD, November 4th.—Low tension porcelain insulators, etc. (Reference B.X. 5 648.)

VICTORIAN ELECTRICITY COMMISSION, November 4th.—Supply of 6 600 V automatic voltage regulators and spares (specification 29/83). (Reference B.X. 5 637.)

WESTERN AUSTRALIA GOVERNMENT, November 29th.—Supply and erection at Perth of (*a*) boiler house equipment, and (*b*) 12 500 kW turbo-generator and condensing plant. Specifications (£1 1s. for each; not returnable) from the Agent-General, Savoy House, Strand, London, W.C.2.

VICTORIAN ELECTRICITY COMMISSION, November 25th.—Switchgear, for Yallourn power station (specification No. 29/103). (Reference B.X. 5 636.)

VICTORIAN ELECTRICITY COMMISSION, November 25th.—Watt-hour meters, recording instruments and remote, metering equipment, for Metropolitan terminal stations and sub-stations (specification No. 29/92.) (Reference B.X. 5 614.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, December 10th.—Three single phase, oil insulated, water-cooled transformers, with accessories (section 295). (Reference B.X. 5 600.)

Tenders Accepted.

WAR OFFICE.—Stella Lamp Co., Ltd., supply of gasfilled and vacuum lamps.

ADMIRALTY.—Edison Swan Electric Co., Ltd., switch sockets, plugs and springs.

GENERAL POST OFFICE.—Stella Lamp Co., Ltd., supply of gasfilled and vacuum lamps.

GUILDFORD CORPORATION.—Hart Accumulator Co., Ltd., overhauling electric vehicle, £170 2s. 4d.

BIRKENHEAD CORPORATION.—Supply of cable, Hackbridge Cable Co., Ltd., £2 053, and Macintosh Cable Co., Ltd., £2 783 10s.

POPLAR (LONDON) BOROUGH COUNCIL.—Metropolitan-Vickers Electrical Co., Ltd., supply of eight 1 000 kW truck type hand controller oil switches.

GENERAL POST OFFICE.—Siemens Electric Lamps and Supplies, Ltd., 12 months supply of Siemens gasfilled standard vacuum and traction type lamps.

METROPOLITAN WATER BOARD.—Worthington-Simpson LTD., two sets of centrifugal pumps, one water driven and one electrically driven, £364 (recommended).

GLASGOW CORPORATION.—A. Reyrolle and Co., Ltd., supply of 20 000 V switchgear for Dalmarnock and Port Dundas; General Electric Co., Ltd., rewinding rotor, £227. (Both recommended).

LONDON COUNTY COUNCIL.—Express Lift Co., Ltd., supply and erection of electric lift at Greenwich power station, £723. Also tendered: Medway's Safety Lift Co., Ltd., £830; A. and P. Steven, Ltd., £835.

METROPOLITAN WATER BOARD.—Supply of electric lamps, normal vacuum type and normal gas filled type, General Electric Co., Ltd.; vacuum traction type, Siemen's Electric Lamps and Supplies, Ltd.

SALFORD CORPORATION.—Nederlandsche Kabelfabriek (Delft, Holland), supply of 24 000 yds. of l.t., paper insulated, lead-covered cable of varying sizes, for working pressure up to 660 V, £8 428 19s. (recommended).

SOWERBY P.C.—Northern Counties Electricity Supply Co., Ltd., public lighting with 78 60 W lamps, alight from half an hour after sunset to 11 p.m., £3 each; one 150 W lamp, £6; and three all night 60 W lamps, £4 18s. each.

SOUTHERN RAILWAY.—Siemens Electric Lamps and Supplies, Ltd., twelve months' supply of Siemens electric lamps; Metro-Vick Supplies, supply of Cosmos metal filament vacuum type and gasfilled lamps for twelve months (part contract).

GENERAL POST OFFICE.—Standard Telephones and Cables, Ltd., radio equipment for London repeater station; Automatic Telephone Mfg. Co., Ltd., equipment for Albert Dock telephone exchange; Siemens Bros. and Co., Ltd., equipment for Eastbourne telephone exchange.

WORK IN PROSPECT.

AMPTHILL.—Additional 52 houses for Rural District Council. Particulars from Surveyor.

AYR.—Nursing home extensions, to cost £2 300, for Misses Neish, 11, Inverkar Road.

BEXLEY HEATH.—Bank, Market Place, for Lloyds Bank Ltd.—Houses (11), for Mr. C. S. Fairman.—Houses (22), Welling, for Mr. J. A. Mills.

BOURNEMOUTH.—Rebuilding pier entrance, with shops, etc., to cost £24 000, for Town Council. Particulars from borough engineer, Mr. F. P. Dolamore.

BRIGHTON.—Operating theatre block, to cost £15 000. Royal Sussex County Hospital. Particulars from Secretary.

BUCKLOW.—Housing scheme (16), Mobberley, for Rural District Council. Particulars from surveyor, Mr. R. C. Cordon, Station Buildings, Altrincham.

CAERPHILLY.—Church, to cost £10 000. Particulars from architects, J. H. Phillips, and Wride, Cardiff.

CARLISLE.—Cinema theatre, to seat 2 000, for Sidney Bacon's Pictures. Particulars from architects, Percy Browne and Sons, London and Newcastle-on-Tyne.

CHARTHAM.—Extensions, Mental Hospital, to cost £17 000, for Kent County Council. Particulars from the clerk, Sessions House, Maidstone.

CONISBOROUGH.—Additional 54 houses, for Urban District Council. Particulars from Surveyor.

DAGENHAM.—Drill hall extensions, for Essex Territorial Army Association. Particulars from architects, Crickmay and Shenstone, 13, Hart Street, London, W.C.

DERBY.—Additional 500 houses, Allestree Park Estate, for Town Council. Particulars from Borough Surveyor.

DONCASTER.—Nurses' Home, for Management Committee of Royal Infirmary. Particulars from Secretary.

EAST GRINSTEAD.—Housing scheme (40 to 50), Sackville Estate, for Urban District Council. Particulars from Surveyor.

FARNBOROUGH.—Nurses' hostel, to cost £15 000, for Bromley Board of Guardians. Particulars from the Clerk.

FULFORD.—Church day schools, to cost £7 000. Particulars from architects, Penty and Thompson, York.

HALSTEAD (ESSEX).—Housing scheme (18), for Urban District Council. Particulars from surveyor, Mr. W. A. Nicholson.

HERTFORD.—Housing scheme, Tewin, for Rural District Council. Particulars from surveyor, Mr. J. W. Riggs.

HOLBEACH.—Extensions, St. Luke's School, for Holland Education Committee. Particulars from contractors, G. Barnsdale and Sons, Donington.

HUDDERSFIELD.—Shops, offices, and warehouses. Particulars from architect, Mr. Norman Culley, 13, John William Street.

HUCKNALL TORKARD.—Extensions, National Schools. Particulars from contractors, Messrs. Harvey, Mansfield.

ILFORD.—School (720 places), Ley Street, for Borough Education Committee. Particulars from clerk, Mr. Adam Partington.

LEEDS.—University gymnasium. Particulars from architects, Lanchester and Lodge, 19, Bedford Square, London, W.C.

LEEK.—Schools (300 places), for St. Luke's Parish. Particulars from vicar, Rev. J. G. Halford.

LOUTH.—Additional housing scheme, for Town Council. Particulars from Borough Surveyor.

LUTTON.—Primitive Methodist Sunday Schools. Particulars from contractors, Messrs. Whatford, Long Sutton.

MARGATE.—School to cost £13 492 for Borough Education Committee. Particulars from contractors, Rice and Son.

MITCHAM.—School (96 places), for Surrey Education Committee. Particulars from secretary, Mr. W. W. Finny, Kingston-on-Thames.

NORTHFLEET.—School (200 places), for Kent Education Committee. Particulars from director of education, Mr. E. Salter Davies, Sessions House, Maidstone.

PAIGNTON.—Extensions, Palace Hotel, including 24 bedrooms. Particulars from Proprietors.—Extensions, Hydro Hotel, including 20 bedrooms. Particulars from Proprietors.

READING.—Extensions, Infirmary, for Board of Guardians, to cost £2 000. Particulars from architect, Mr. W. Roland Howell, 17, Blagrave Street.—Geology block, London Road, for University Authorities.—School, Wardle Crescent, Tilehurst, for Miss K. M. Spencer.

RIPLEY (DERBYSHIRE).—Public baths, for Urban District Council. Particulars from Surveyor.

ELECTRICITY SUPPLY.

Cavan Electric Light and Power Co. Purchased—Peterhead and Holywood Electricity Schemes—French Supply Statistics—Proposed Mains Extensions at Croydon—Springhead U.D.C. and Overhead Lines.

CROYDON Electricity Committee has obtained sanction to borrow £25 000 for mains extensions and £12 700 for plant.

Seaham Harbour Electricity Committee seeks sanction to borrow a further £6 000 in connection with the assisted wiring scheme.

Sheffield Electricity Committee has obtained sanction for a loan of £50 000 for wiring consumers' installations for hire purchase.

Paddock Wood P.C. has arranged for the public lighting of the village with 33 lamps by the Weald of Kent Electric Supply Co.

Yarmouth Corporation has approved the arrangements made with Electrical Enterprise, Ltd., to supply electricity in bulk to Bungay.

Carlisle City Council is to apply for a Special Order extending the area of supply to parishes within the areas of the Longtown and Brampton Rural District Councils.

Letterkenny U.D.C. has been informed by the Electricity Supply Board that it is hoped to have plant installed for the electric lighting of the town by next October.

Dorchester Abbey, Oxfordshire, is now lighted electrically, a temporary plant having been lent by the Wessex Electricity Co. until a permanent supply is taken to the village.

The application of Norwich Corporation to supply in Erpingham rural district has been refused, and powers for the area have been granted to the East Anglian Electric Supply Co.

The Irish Free State Electricity Supply Board has acquired the Cavan Electric Light and Power Co.'s undertaking for £6 414. This is said to represent a loss of 50% to the shareholders.

Norfolk Education Committee has considered applications for electric lighting installations in schools, and has decided that no general policy be framed, but that each case shall be considered separately.

Springhead U.D.C. has decided not to oppose the application of the Stalybridge, Hyde, Mossley, and Dukinfield Tramways and Electricity Board for permission to erect overhead electric lines in the district.

Upholland U.D.C. has applied for a loan of £2 986 for the electrification of its pumping plant. All the public gas lamps are to be converted to electricity at a cost of £550. Mains are being laid by Wigan Corporation.

Norfolk County Council has prepared plans and specifications of heating apparatus, electric light wiring, bells, telephones, etc., for the mental hospital. Estimates have been submitted to the Board of Control.

The Peterhead electricity scheme has now been completed, and shops and dwelling-houses in the principal streets of the town are now lighted electrically. Many orders have been received from shopkeepers and householders for supplies.

A concession has been granted to the Bolivian Power Co. for the utlisation of the Zongo Falls. The first stage of the scheme will include the construction of a large dam and the installatiion of an electrical generating plant of about 22 250 kW.

A Ministry of Health inquiry was held recently into the application of Birtley P.C. for a loan of £2 600 for the purpose of public lighting by electricity. The application was opposed by the Newcastle and Gateshead Gas Co. and the Birtley Iron Co.

Oldham Corporation has abandoned, for the present, a proposal for effecting saving in connection with the lighting of new streets, etc., by laying only one set of mains, either gas or electric, for street lighting, domestic lighting and heating purposes.

Good progress is being made with the Holywood electricity scheme, which is to obtain its supply by overhead line from Belfast. Many applications have been received from intending consumers, and the positions are being marked for street lighting standards.

Portsmouth Electricity Committee has decided upon a scheme, to cost £16 000, for mains extensions to Sarisbury.—The Committee has decided to erect a sub-station at Portsbridge. The Engineer reports that the cost of the proposed sub-stations at Lee-on-the-Solent, Hayling Island, and Stubbington will be £1 759.

Marylebone (London) Electricity Committee has made an agreement with the North Gate Estate Co., Ltd., to provide for the installation of rising mains at blocks of flats at North Gate, Regents Park, at a cost to the Council of £1 437, and has authorised expenditure of £1 941 distributor cable and services in connection with the scheme.

Cape Town Electricity Committee has entered into an agreement with African Theatres, Ltd., for the supply of electricity in bulk to the Alhambra Theatre, Riebeek Street, the Bio-Vaudeville Theatre, St. George's Street, the adjoining Overflow Bio Theatre, Dock Road, and a new hotel at the corner of Adderley and Riebeek Streets.

Official statistics show that 20 907 communes in France now have electric light and power supplies. During last year the number of consumers in Paris increased by 9 % and the consumption of current by 11 %. The four great light and power companies which supply the Paris district, last year sold to the public 1 800 millions of kWh, representing a consumption of 1 400 000 tons of coal.

Caistor R.D.C. has consented to an application by the Yorkshire Electric Power Co. for a Special Order to supply electricity in the Council's area. At present the parishes of Brocklesby, Keelby, Riby, and Swinhope are included in the Grimsby Corporation Order, and the Clerk has been instructed to request the Commissioners to have these parishes included in the Order of the Yorkshire Electric Power Co.

Herne Bay Pier Committee has considered estimates of the cost of floodlighting the clock tower, Grand Pier Pavilion, and King's Hall, but has decided to make no recommendation with regard to carrying out the work. The cost of floodlighting the clock tower (scheme No. 1) would be £221 3s. 9d., and for scheme No. 2, £196 12s. The committee is obtaining estimates for strip lighting the Grand Pier Pavilion and the King's Hall.

Until Eastbourne Corporation obtains power to extend its area of supply, the Electricity Committee is unable to give a definite reply to an application on behalf of Messrs. Johnson and Phillips for terms for a bulk supply for distribution in the Chailey and Eastbourne Unions south of Ringmer. The Corporation is to seek sanction for loans of £13 552 for laying an 11 000 V feeder to a new sub-station at Upperton Road, and £28 678 for switchgear and transformers for bulk supply.

Godalming T.C. has entered into an agreement with the Urban Electric Supply Co. for supplying the housing estate at Binscombe Lane. The company will lay the services and instal four lighting points, including lamps, shades, etc., at each house, free of cost to the Council or tenants. Electricity will be supplied at a minimum of £3 per annum for 120 kWh, and at 3d. per kWh between 120 and 240, and at 1½d. per kWh beyond, the charges to be collected weekly by the company.

Newry U.D.C. has approved of the recommendation of the Electricity Committee to apply for sanction to pay interest on a loan from the bank, not exceeding £1 000, to March next or till revenue for current sold came in; to apply to the Electricity Commissioners for sanction to the raising of a supplemental loan of £5 000 to defray the cost of extensions of mains already carried out or in hand, as well as further extensions towards which it is estimated a sum of £1 780 will be available, and that sanction be sought to the raising of £2 500 to meet outlay in respect of hire purchase of electrical wiring equipment and appliances, and for the assisted wiring of small dwellings.

Under the agreement for the supply of electricity by Torquay Corporation to Torquay Tramways Co., Ltd., the company has hitherto paid a price based upon the cost of coal delivered to the power station. It is alleged by the company that the installation of a mechanical coal conveyor has removed the occasion for this charge. Negotiations have resulted in an offer by the company to pay a charge, based upon 9d. per ton of coal instead of 1s. 7d., and the Electricity Committee has accepted this offer for the remaining term of the agreement. The discount for prompt payment of accounts for electricity used for power purposes under the special sliding scale are to be at the rate of 5% instead of 2½%.—The Corporation has approved a scheme submitted by the Acting Borough Electrical Engineer for improving the lighting of the town hall ballroom.

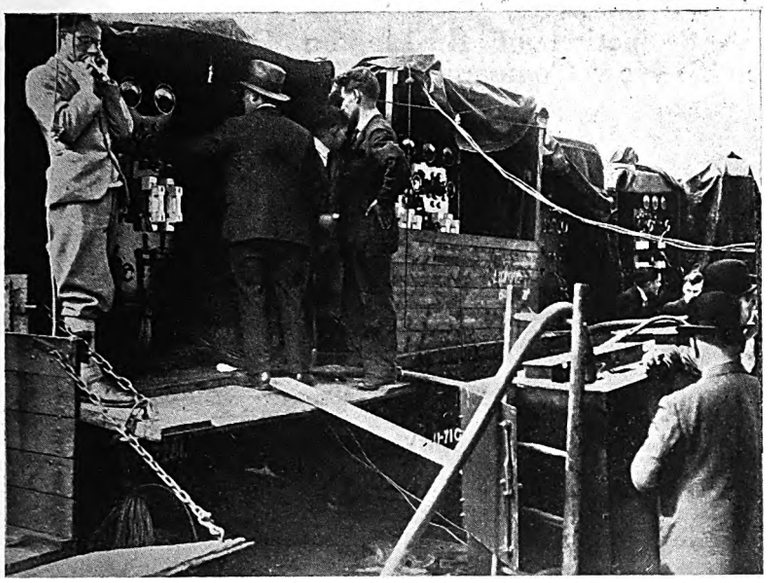
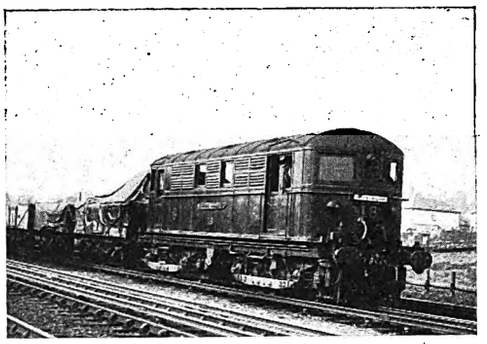
ELECTRICAL NEWS OF THE WEEK IN PICTURES.



Apart from the fact that the " tote " is itself of electrical interest, the plant required in connection with its operation is also worthy of attention. Kept away from the public gaze it is perhaps sometimes overlooked, but this photograph of the switchgear, etc., at Hurst Park, shows that the equipment involved assumes considerable proportions, in spite of its transportability.



One of the first goods trains to be hauled electrically on the Metropolitan (London) Railway. The locomotive is said to be capable of a speed approaching 60 m.p.h. and is used for transporting part of London's meat and milk supplies.

At the Los Angeles Radio Show a large fleet of perambulators was equipped with receiving apparatus in a novel pre-opening demonstration. During the show, with each perambulator tuned-in to a different station, various bedtime story-tellers competed, the winner being the speaker who put his baby to sleep first.

Lessons in the use of the automatic telephone system are being given every afternoon at the Science Museum, London. Classes of school children are brought by their teachers to attend these free lectures. A model automatic exchange has been installed, with six switching centres, and it is claimed by the Post Office to be the most elaborate mechanism of its kind.

A Ministry of Transport inquiry was held at Clitheroe last week into an application by the Corporation for compulsory wayleaves for a transmission line from Chatburn to Grindleton. Several landowners lodged objections. The Corporation offered 2s. 6d. per pole, leg or stay in meadowland, and 1s. elsewhere. Mr. T. Robinson submitted that 2s. 6d. per pole and 1s. per stay wire should be allowed, irrespective of the nature of the land. The Ministry's decision will be announced in due course.

In reference to the Shannon scheme, the Irish Free State Electricity Supply Board forecasts that by the end of 1929 the distribution network in all towns and villages of over 500 inhabitants, within easy reach of the scheme, will be complete. It is expected that the supply will be available by the end of the year, and it will be then possible to supply those towns and villages without further delay. Already some 5 600 posts have been erected, fitted with some 50 000 insulators, carrying about 700 miles of wires and 39 pole transformers, and 25 kiosks are in position. Some of the towns and villages on the Leinster loop of the scheme are receiving temporary current from the Dublin power house.

Oxford Corporation Water Committee has accepted the following terms for the supply of current by the Abingdon Electric Co. to North Hinksey pumping station: The Corporation to take a supply for the whole of its pumping requirements for ten years and to pay a service charge of £100 for l.t. mains; the charge for the first 2 500 kWh or less per quarter to be £18 15s.—additional consumption, 1½d. per kWh. These charges are based on a restricted period—namely, that the supply shall not be taken, except in cases of emergency, between the hours of 3.30 and 6.30 during November and December. Should, however, the current be taken during these two months between such hours, the charges are to be based on a minimum annual consumption of 13 400 kWh, charged at the rate of £25 per quarter, and a coal clause is to apply to all energy consumed.

Hastings Electricity Committee has been negotiating with Messrs. C. J. Banister and Son, Northiam, who have been supplying electricity to consumers in Northiam under a certificate from the Electricity Commissioners, with reference to their claim for compensation in respect of the plant and goodwill of their electricity undertaking. The Committee now recommends that Messrs. Banister be paid £500 as an ex-gratia payment for their undertaking, and consumers in the east end of the village may be supplied by Messrs. Banister until the Council is in a position to do so.—The Corporation electricity department is to extend mains to give supplies to Northiam and Battle.

COMPANY NEWS.

Advance of English Electric Shares—Reduction of Ruskington Company's Prices—Reports and Dividends—New Companies Registered.

THE feature this week of our usual comparison of electrical share quotations is the advance, the result of steady buying, in the ordinary shares of the English Electric Co. These have risen during the past week from 6s. 3d. to 8s. 9d., or forty per cent. The 6 per cent. preference are 7½d. better in sympathy. Selling of Cables and Wireless "B" has continued, the quotation further relapsing to nearly 65. Marconi's International Marine shares have further declined 3s. 9d. to 55s. In the supply section, County of London ordinary at 57s. 6d. are half-a-crown up, and Metropolitans 1s. 3d. at 45s. London Electric Supply shares have weakened to 27s. 6d.

Surplus for qtr. $1 409 299 and for six months, $4 996 487.

Company Meeting.

RUSKINGTON ELECTRIC SUPPLY CO., LTD.—Dr. J. B. B. Whelan, presiding at the recent annual meeting, said the directors felt justified in conceding a reduction from 1s. 3d. to 1s. per kWh for the six winter months. The directors appealed for more consumers, and a greater consumption of current at the reduced rate. No dividend was declared on the ordinary shares, but it was decided to pay the dividend on the 5% preference shares. The report and accounts were adopted.

THE LEAD MARKET.

According to James Forster and Co., the lead market on Monday, August 26th, after a turnover of 1 200 tons, closed unchanged at £23 5s. for September, October and November. On Tuesday, after transactions totalling over 3 000 tons, an advance of 2s. 6d. to 3s. 9d. per ton was registered, nearly all the business being at £23 7s. 6d. and £23 8s. 9d. for November and December shipment. Wednesday's market was unchanged, £23 8s. 9d. being again paid for a few hundred tons. Thursday, with a turnover of nearly 2 000 tons, marked a further advance of 2s. 6d. per ton, whilst Friday's market was quiet, with a few transactions for October and November shipment at £23 11s. 3d.

Closing prices on August 30th were: £23 8s. 9d. for August, £23 10s. for September, and £23 11s. 3d. for October and November, an advance of 6s. 3d. per ton on the week.

COMMERCIAL INFORMATION.

County Court Judgments.

[NOTE.—*The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debt. They may be for actions. But the Registry makes no distinction. Judgments are not returned to the Registry if satisfied in the Court books within 21 days.*]

APEX ELECTRICAL CO., Blackpool Street, Burton-on-Trent, electrical dealers. £16 13s. 4d. August 2nd.

BARDSLEY, James, 16, Brownlow Hill, Liverpool, wireless dealer, £10 17s. 8d. July 24th.

BEAUMONT J. W. INGLE AND CO., The Elms, Unthank Road, Norwich, electrical engineers. £10 17s. 9d. July 30th.

BERRY AND HAYWARD, LTD., Granby Street, St. James' Street, Nottingham, electrical engineers. £22 19s. 5d. July 3rd.

CUNNINGHAM AND SLATER, LTD., 146, Kensington High Street, W., electrical contractors. £18 4s. 6d. July 1st.

DUCK, James, High Street, Marlborough, wireless dealer. £26 6s. 5d. July 3rd.

HACKING, Mr. L., 25, Milnshaw Lane, Accrington, wireless dealer, £18 12s. 9d. June 25th.

JENNINGS, Mr. P., 33, Garstang Avenue, Bolton, electrical fittings dealer. £22 7s. 10d. July 17th.

LANSDOWN, Mr. G., 20, Market Place, Chalfont St. Peters, wireless dealer. £11 3s. 9d. July 3rd.

LIGHT-O-DAY ELECTRIC LAMP CO. (1927) LTD., 318A, Euston Road. £42 18s. 8d. July 22nd.

MALLINSON, J. W., AND SON, 120, Padiham Road, Burnley, electrical engineers. £31 16s. July 2nd.

POWER, Mr. O., Universal Stores, Bridgend, electrical engineers. £12 3s. 10d. July 10th.

RADIO DEN, 93, Chertsey Road, Woking, electrical dealers. £29 10s., July 16th.

SIMS, Mr., 160, Bedford Road, Rock Ferry, wireless dealer. £26 19s. 3d. July 24th.

SHAPLAND, Mr. A. E., Chippenham Cottage, Exmouth, wireless dealer. £29 7s. 4d. July 4th.

SQUIRES, S. G., 85, High Street, Billericay, wireless dealer £22 6s. 10d. July 22nd.

WALKER, H. F., Mr., 193C, Balham High Road, S.W., wireless dealer. £18 5s. 5d.. July 4th, and £15 3s. 3d., July 3rd.

YOUNG'S BAZAAR, 6, Royal Victoria Arcade, Union Street, Ryde, I. of W., wireless dealers. £16 6s. 5d., July 26th.

Bills of Sale.

BURGESS, Alfred, 4, Ogwen Street, Everton, electrician. Dated August 29th, filed August 31st, £52.

DURRANT, Joseph, 129, Parish Lane, Penge, electrician. Dated August 23rd, filed August 27th. £40.

Mortgages.

[NOTE.—*The Companies Act of 1908 provides that every Mortgage or Charge, as described therein, shall be registered within 21 days after its creation, otherwise it shall be void against the liquidator and any creditor. The Act also provides that every Company shall, in making its annual Summary under the Companies Act, specify the total amount of debt due from the Company in respect of all Mortgages or Charges. The following Mortgages and Charges have been so registered. In each case the total debt prior to the present creation, as specified in the last available Annual Summary, is also given—marked with an *—allowed by the date of the Summary, but such total may have been reduced.*]

ATLAS CARBON AND BATTERY CO., LTD., London, S.E.—Registered August 20th, debenture to Barclays Bank, Ltd. securing all moneys due or to become due to the Bank; general charge. *£2 400. December 31st, 1928.

BOWMAN (E. J.) (BIRMINGHAM), LTD., radiator manufacturers.—Registered August 19th, £1 000 1st debenture, to W. I. Rodway, Cornwall Street, Birmingham, wood engraver; general charge.

DIONOID BATTERY CO., LTD., Sheffield.—Registered August 26th, £1 000 debentures; general charge. *Nil. March 17th, 1928.

DORIAN WIRELESS CO., LTD., London, W.—Registered August 22nd, £2 100 debenture, to E. L. Lumley, 39, Lombard Street, E.C., insurance broker; general charge.

London Gazette, etc.

Company Winding-up Voluntarily.

CHATWIN (W.), LTD. By reason of its liabilities, August 26th. T. J. Prentice, 31-32, Bayley Lane, Coventry, accountant, appointed as liquidator. Meeting of creditors at the offices of R. A. Rotherham and Co., Solicitors, 38, Bayley Lane, Coventry, on Tuesday, September 10th, at 12 noon.

Bankruptcy Information.

MADDOX, Victor Frederick, 6, Homend Street, Ledbury, Hereford, electrical and wireless engineer. First meeting, September 7th, 12 noon. Official Receiver's Office, 133, Saint Owen Street, Hereford. Public examination, October 7th, 2.30 p.m., Shirehall, Hereford.

Notices of Intended Dividends.

WILMINGTON, Granville, 75, Railway Street, Nelson, electrical and radio engineer. Last day for receiving proofs, September 14th. Trustee, J. W. Carter, District Bank Chambers, Blackburn, Official Receiver.

LITTLER, John, 9, Hoghton Street, Southport, electrical and radio engineer. Last day for receiving proofs, September 14th. Trustee, A. T. Eaves, 47, Mosley Street, Manchester.

RICHARDS, Stanley Wyndham, of the Blackwood Radio and Electrical Supply Depot, High Street, Blackwood, Monmouthshire, radio engineer and electrical contractor. Last day for receiving proofs, September 16th. Trustee, E. Owen, 34, Park Place, Cardiff, Official Receiver.

Partnership Dissolved.

FRANK RIDDIOUGH AND SON (Frank RIDDIOUGH and John William RIDDIOUGH), hardware merchants, at Colonnade, Westgate, and as wireless factors, at 8, Simes Street, Bradford, by mutual consent as from June 30th, 1929. Debts due to and owing by the hardware merchants branch of the late firm will be received and paid by F. Riddiough, who will carry on business as a hardware merchant at Colonnade, Westgate, Bradford, under the style of Frank Riddiough, and all debts due to and owing by the wireless factors branch of the late firm will be received and paid by J. W. Riddiough, who will carry on business as a wireless factor at 8, Simes Street, Bradford, under the style of Frank Riddiough and Son.

Bankruptcy Proceedings.

DAVIES, Harold Walter, and DAVIES, Reginald Albert, 34, Mill Street, Crewe, Cheshire, trading as DAVIES BROTHERS, wireless dealers, etc. The public examination was held at Crewe on August 29th, when a statement of affairs was presented which showed liabilities of £573, against assets of £45. The debtors stated that in November, 1927, they purchased, for £325, a cycle and wireless business at Northwich, borrowing the money from their mother and agreeing to repay at the rate of £5 10s. per month. The takings had averaged £15 per week, and the trade expenses £4. In June, 1928, the premises and stock were destroyed by fire, the loss being estimated at £800, but they were unable to prove this amount to the insurance company, owing to the destruction of the books, and they were paid £503 in settlement of their claim. In September of last year they opened another shop at Crewe, where the takings averaged £18 per week, and the trade expenses £2 10s. They closed the Northwich shop in December, and entered into negotiations with a firm to take the premises for the remainder of the term of the lease on the payment by debtors of £50, which amount they borrowed from their mother, and subsequently repaid her. The business had recently declined, through unemployment in the town, profits being insufficient to meet trade expenses. They did not become aware of their position until May when they were sued. The examination was closed.

TURNER, Oliver Bramwhite, Paddock House, Yeadon, Yorkshire, salesman of electrical apparatus. The receiving order against the above was made on the debtor's own petition on August 12th. At the first meeting of the creditors held on August 29th, at the Official Receiver's office, 24, Lower Bond Street, Leeds, a statement of affairs presented showed liabilities amounting to £114, with no assets. The case, being a summary one, was left with the Official Receiver. The following are creditors:—Inland Revenue, Leeds, £11; Bankers, Sheffield, £20; Sharp and Griffiths, Baildon, £21; West Ham Guardians, West Ham, £10.

READ, Roland Arthur, electrical engineer and wireless goods dealer, 9, The Pavement, Middle Lane, Crouch End. The public examination of this debtor was held on September 3rd, before Mr. Registrar Warmington, at the London Bankruptcy Court, the accounts showing liabilities of £810 and assets valued at £219. In reply to Mr. Armstrong, assistant official receiver, the debtor stated that prior to September, 1926, he was employed as a process inspector to an electrical company. In the following November he borrowed £50, and with £75 capital acquired a twelve years' lease of a lock-up shop at 2a, The Pavement, at a rental of £80 per annum. He began to trade there as an electrical engineer, dealing mainly in wireless goods. After trading fairly successfully for two years, he removed to 9, The Pavement, of which he acquired a 14 years' lease from December, 1928, at a rental of £185 a year. In March, 1929, he realised he was in financial difficulties, and in April he acquainted his principal creditors of the fact, but continued to trade until July 16th, when he presented his petition because three judgments had been obtained against him. The debtor attributed his insolvency to lack of capital, heavy overhead charges, liability under the leases of the business premises and a tenancy of his private house in Topsfield Parade, Crouch End, and to insufficiency of profits to cover drawings. The examination was concluded.

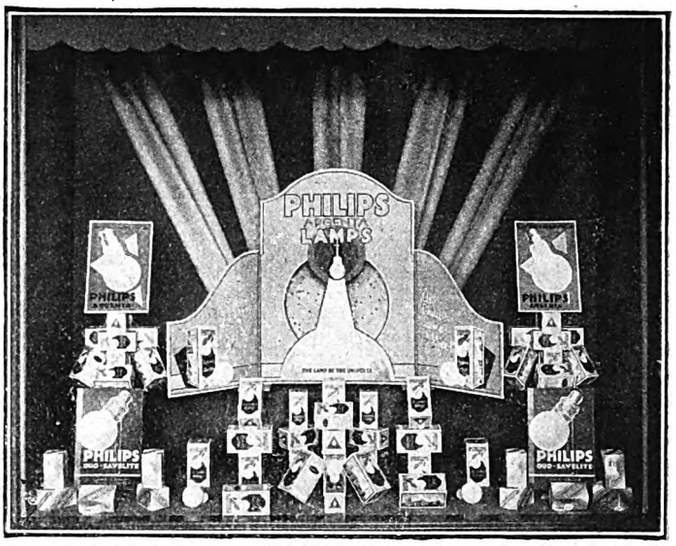
PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

314 196 P. Porzellanfabrik Rosenthal and Co. Akt.-Ges. and O. Becker. Electric insulators. (5/6/28.)
293 380 British Thomson-Houston Co., Ltd. Sound-reproducing apparatus. (5/7/27.)
292 148 International General Electric Co., Inc. Recording-devices. (15/6/27.)
292 475 Associated Electrical Industries, Ltd. Contact fingers for electrical apparatus. (18/6/27.)
314 216 S. W. Hamlyn, L. Dernier and Hamlyn, Ltd. Electric lamp shades and/or fittings. (23/6/28.)
314 226 Benjamin Electric, Ltd., and H. T. Harrison. Reflectors for artificial lighting. (6/7/28.)
293 428 British Thomson-Houston Co., Ltd Electric oil-switches. (6/7/27.)
294 176 Carborundum Co. Manufacture of carbon electrodes and other refractory articles. (19/7/27.)
314 237 F. A. Cortez-Leigh and J. A. Franck. Current-collecting shoes for electric trains. (16/7/28.)
295 331 Associated Electrical Industries, Ltd. Electrical signalling and/or controlling systems. (9/8/27.)
295 934 Siemens-Schuckertwerke A.-G. Electrical switchgear installations. (20/8/27.)
297 108 Siemens-Schuckertwerke A.-G. Electric protective-arrangements for three-phase circuits. (16/9/27.)
296 057 Siemens-Schuckertwerke A.-G. High-power light projectors. (24/8/27.)
296 031 F. Conrad. Electric clocks. (17/3/27.)
314 268 H. S. Walker. Under-floor duct systems for electric distributions. (24/8/28.)
296 102 M. Latour. Electro-capillary devices. (25/8/28.)
296 375 Loewe-Audion Ges. and B. Wienecke. Arrangement of electric-wire leads through glass parts. (30/8/27.)
309 067 Ideal Werke Akt.-Ges. fur Drahtlose Telephonie. Loud-speakers. (4/4/28.)
314 272 T. Smith. Insulator-carriers for overhead electric wires. (12/9/28.)
297 471 British Thomson-Houston Co., Ltd. Induction-voltage regulators. (23/9/27.)
299 316 British Thomson-Houston Co., Ltd. High-frequency electric signalling systems. (21/10/27.)
303 003 Sulzer Freres Soc Anon. Ignition-devices for use with fire-grates burning solid fuels. (24/12/27.)
282 688 J. E. Noeggerath. Electrolytic apparatus. (21/12/26.)
314 591 J. L. Baird and Television, Ltd. Television and like apparatus. (4/1/28.)
291 424 Hermsdorf-Schomburg-Isolatoren Ges. Electrical condensers. (4/6/27.)
314 594 I. Ainstein. Electro-deposited protective coatings for vessels. (4/2/28.)
314 313 Siemens Bros and Co., Ltd., and D. A. Christian. Automatic telephone systems. (25/2/28.)
314 558 Electro-Bleach and By-products, Ltd., and J. Hollins. Electro-deposition of metals. (25/2/28.)
286 229 Akt.-Ges. Brown, Boveri et Cie. Means for balancing rotary casings of refrigerating machines. (28/2/27.)
314 457 P. Grant and Ruston and Hornsby, Ltd. Controlling alternating-current motors. (23/3/28.)
294 563 Naamlooze Vennootschap Hengelosche Electrische en Mechanische Apparaten-Fabriek, and H. A. W. Klinkhamer. Asynchronous motors. (26/3/27.)
291 392 C. S. Ashcraft. Electric arc lamps. (1/6/27.)
301 012 C. S. Ashcraft. Electric arc lamps. (23/11/27.)
289 021 Associated Telephone and Telegraph Co. Electric contacts. (20/4/27.)
314 367 S. G. S. Dicker (Naamlooze Vennootschap Philips' Gloeilampenfabrieken). X-ray apparatus for crystallographic examination and like purposes. (26/3/28.)
314 411 Standard Telephones and Cables, Ltd., and T. S. Skillman. Relay arrangements, particularly for use in automatic or semi-automatic telephone systems. (27/3/28.)
289 426 Landis and Gyr Soc. Anon. Electric induction meter. (27/4/27.)
314 463 Standard Telephones and Cables, Ltd., and E. P. G. Wright. Automatic and semi-automatic telephone systems. (28/3/28.)
314 464 Standard Telephones and Cables Ltd. (Western Electric Co., Inc.). Glow discharge lamps. (28/3/28.)
314 465 Standard Telephones and Cables, Ltd., and J. R. Gould. Automatic or semi-automatic telephone systems and apparatus therefor. (28/3/28.)
314 562 Standard Telephones and Cables, Ltd., G. C. Hartley, and A. H. Cameron. Automatic or semi-automatic telephone systems. (29/3/28.)
314 563 Standard Telephones and Cables, Ltd., J. H. E. Baker, A. H. Cameron, and L. B. Haigh. Telephone systems. (29/3/28.)
314 564 Standard Telephones and Cables, Ltd., and W. K. Weston. Electric communication cables. (29/3/28.)
314 565 Standard Telephones and Cables, Ltd. (Western Electric Co., Inc.). Electrolytic condensers. (29/3/28.)
288 149 British Thomson-Houston Co., Ltd. Electric condensers. (1/4/27.)
314 567 J. Dornan. Electric heating devices. (29/3/28.)
314 570 Young, Osmond and Young, Ltd., and C. C. Turner. Electric junction boxes and electric heating apparatus comprising the same. (29/3/28.)
314 575 W. E. Beatty (Bell Telephone Laboratories, Inc.). Method of and apparatus for measuring mechanical impedance. (30/3/28.)
314 576 J. Stone and Co., Ltd., and A. E. Honey. Brush and terminal contact-mechanism of dynamo-electric machines. (30/3/28.)
314 577 Automatic Telephone Manufacturing Co., Ltd., S. R. Smith, and T. P. Preist. Impulse generators for use in telephone or like systems. (30/3/28.)
288 547 Tchoubritch, Derval and Co. Automatic circuit selectors for telephony (11/4/27.)
314 579 S. C. Smith. Electrolytic recovery of metals. (30/3/28.)
314 582 R. L. Rogers, and S. Smith and Son, Ltd. Timing-instruments actuated or controlled by electric impulses. (31/3/28.)
292 528 Electrical Research Products, Inc. Regulators for controlling the speed of electric motors. (21/6/27.)
314 584 A. Matthews. Electrical heaters. (31/3/28.)
288 631 International General Electric Co., Inc. Protective devices for electric circuits. (14/4/27.)
314 603 A. G. Smith. Multiple-filament electric lamps for vehicles. (4/4/28.)
289 049 Associated Telephone and Telegraph Co. Telephone systems. (22/4/27.)
314 605 J. S. C. Salmond and L. S. B. Alder. Methods and means for amplifying in wireless telegraphy and telephony. (4/4/28.)
288 333 British Thomson-Houston Co., Ltd. Purification of alkali or alkaline earth metals, and the production of alloys therefrom. (6/4/27.)
300 620 I. Kitsee and D. C. Law. Loud-speaking telephones and like electro-acoustic devices. (18/11/27.)
314 616 Callender's Cable and Construction Co., Ltd., and J. H. S. Ross. Tensioning arrangements for cables and the like. (14/4/28.)
314 626 M. H. Goldstone and Ward and Goldstone, Ltd. Electrical switch or key lamp holders. (24/4/28.)
289 470 British Thomson-Houston Co., Ltd. Automatic electric switching systems. (28/4/27.)
289 416 C. Chilowsky and A. Guerbilsky. Television methods and apparatus. (26/4/27.)
314 629 Siemens and General Electric Railway Signal Co., Ltd., and F. L. Castle. Electrical signalling systems. (27/4/28.)
314 630 J. C. Petersen, J. Edgar, and A. J. Wares. Electrical boiling and cooking apparatus. (2/5/28.)
314 632 Sun Electrical Co., Ltd., and S. A. Coleman. Holders for electric incandescent lamps. (3/5/28.)
314 640 English Electric Co., Ltd., and F. Morris. Controlling gear for electrically propelled vehicles. (9/5/28.)
291 352 Telefonaktiebolaget L. M. Ericsson. Selector switches for automatic telephone systems. (30/5/27.)



An attractive window display devoted to some of the products of Philips Lamps Ltd.

314 648 Electramonic Co., Ltd., S. J. Tyrrell, D. W. Sayers, and L. N. Tyrrell. Gramophone pick-up devices. (24/5/28.)
314 649 F. J. Wineberg. Electric or imitation fires or radiators. (26/5/28.)
314 655 H. Kindermann. Electric switches for the motors of spinning-pots for the production of artificial silk. (1/6/28.)
314 656 G. Cluley, and Associated Electrical Industries, Ltd. Fault indicators for overhead transmission lines. (1/6/28.)
314 660 British Thomson-Houston Co., Ltd., A. P. Young, and J. H. Butcher. Sound reproducing instruments. (11/6/28.)
292 541 British Thomson-Houston Co., Ltd. Refrigerator cabinets. (21/6/27.)
297 099 E. J. Muller. Contacting device for electric flashing signs. (16/9/27.)
314 675 Walker, Hunter and Co., Ltd., and J. Walker. Terminal connections for electric heating-elements. (2/7/28.)
293 394 British Thomson-Houston Co., Ltd. Refrigerating machines. (5/7/27.)
314 680 E. W. C. Russell (C. B. Sawyer). Method of improving piezo-electric crystals. (6/7/28.)
295 395 J. S. Lottrup. Inductance coils. (11/8/27.)
314 715 A. Baker. Moving-coil loud-speakers. (15/8/28.)
307 702 C. Tourne. Incandescent electric lamps and the like. (9/3/28.)
307 785 Siemens-Reiniger-Veifa Ges. Fur Medizinische Technik. Apparatus for operating Röntgen tubes. (13/3/28.)
297 326 International General Electric Co., Inc. Electric motor controllers. (17/9/27.)
314 728 Associated Electrical Industries, Ltd. (Westinghouse Electric and Manufacturing Co.). Arc welding apparatus. (18/9/28.)
297 435 International General Electric Co., Inc. Protective devices. (21/9/27.)
305 569 Electrometallurgique de Montricher. Poking and stirring apparatus for electric furnaces. (7/2/28.)
298 641 British Thomson-Houston Co., Ltd. Centrifugal electric switches. (13/10/27.)
298 913 H. Lewy and H. Fleig (trading as J. Lewy Gloria-Werke (firm of)). Pocket lamps. (14/10/27.)
314 741 D. L. Chandler. Electric bread toaster. (20/10/28.)
299 398 International General Electric Co., Inc. Enamelling furnaces or the like. (25/10/27.)
299 779 F. Szalay. Device for preventing the tilting movement of the bows of current collectors. (31/10/27.)
299 435 British Thomson-Houston Co., Ltd. Electric switches. (26/10/27.)
301 725 Siemens-Schuckertwerke Akt.-Ges. Means for protecting the separable switch members of withdrawable switchgears from dust, dirt, and the like. (3/12/27.)
300 586 E. Hausdorf. Telephones furnished with amplifying means. (15/11/27.)
302 307 British Thomson-Houston Co., Ltd. Electron discharge apparatus. (14/12/27.)
301 086 M. Charles. Adjustable sockets for electric lamps. (25/11/27.)
301 843 Associated Telephone and Telegraph Co. Telephone systems. (13/8/27.)
302 654 Akt.-Ges. Brown, Boveri et Cie. Mercury-vapour rectifiers. (19/12/27.)
303 352 Akt.-Ges. Brown, Boveri et Cie. Strainers for the overhead lines of electric railways. (31/12/27.)
314 470 Electro Bleach and By-Products, Ltd., and J. Hollins. Electro-deposition of metals. (25/2/28.)
297 723 Hazeltine Corporation. Radio frequency amplifier. (26/9/27.)
314 884 A. H. Marks and P. Russell (legal representatives of E. C. R. Marks (deceased)). (Vreeland Corporation). Selective amplifiers particularly suitable for wireless reception. (3/1/28.)
288 240 Siemens und Halske Akt.-Ges. Arrangement for automatically modifying the relative amplitudes of signal currents. (7/4/27.)
286 277 Pioneer Instrument Co., Inc. Method of and apparatus for counteracting undesirable magnetic fields. (2/3/27.)
286 606 Allmanna Svenska Elektriska Aktiebolaget. Excitation of continuous-current generators. (5/3/27.)
314 915 S. G. S. Dicker (N. V. Philips' Gloeilampenfabrieken). Multiphase alternating-current rectifying systems. (5/3/28.)
314 773 L. Zwilling. Electrical gas lighters. (27/3/28.)
314 774 Birmingham Electric Furnaces, Ltd., and A. G. Lobley. Current supply control systems of electric furnaces and analogous electric heating installations. (28/3/28.)
314 775 Birmingham Electric Furnaces, Ltd., and A. G. Lobley. Electric furnaces. (28/3/28.)
302 987 Constructions Electriques de France. Electric circuit-breakers. (24/12/27.)

18 455 R. Stehle. Electrical drive for gramophones.
18 496 G. Turner. Tuning coil for wireless receivers.

COMING EVENTS.

Saturday, September 7th.

Institution of Electrical Engineers (North Western Students' Section).—Inaugural meeting. Visit to the River Dee Hydro-Electric Station at Chester.

Monday, September 9th.

Electrical Contractors' Association (Hastings Branch).—Lewcocks' Restaurant. Ordinary meeting.

Electrical Contractors' Association (Liverpool Branch).—Ordinary meeting.

Association of Public Lighting Engineers.—Town Hall, Bournemouth. Sixth annual general meeting and conference.

Tuesday, September 10th.

Electrical Contractors' Association (Swansea Branch).—Ordinary meeting.

Electrical Contractors' Association (Leicester Branch).—Corridor Chambers. Ordinary meeting. 2.30 *p.m.*

Association of Public Lighting Engineers.—Town Hall, Bournemouth. Conference; paper by Ex-Bailie J. MacDougall on "Lighting and Rating," 10 *a.m.*; paper by Mr. C. H. Woodward on "Compromise in the Use of Illuminants for Public Lighting," 2.30 *p.m.*

Tuesday, September 10th—Thursday, September 12th.

Iron and Steel Institute.—Festival Hall, North-East Coast Exhibition, Newcastle. Autumn meeting, commencing at 10.15 *a.m.* on Tuesday, and 10 *a.m.* on Wednesday and Thursday.

Wednesday, September 11th.

Association of Public Lighting Engineers.—Town Hall, Bournemouth. Conference, 9.30 *a.m.*; papers by Messrs. J. F. Colquhoun and E. J. Stewart on "American Practice in Public Lighting," and Mr. J. S. Dow on "Private Lighting as a Supplement to Public Lighting," 10 *a.m.*

Electrical Contractors' Association (Eastbourne Branch).—South Street. Ordinary meeting.

Electrical Contractors' Association (Sheffield Branch).—Ordinary meeting. 5.30 *p.m.*

Thursday, September 12th.

Electrical Contractors' Association (East Yorks Branch).—Metropole Hall, Hull. Ordinary meeting.

Electrical Contractors' Association (Nottingham Branch).—Ordinary meeting.

Electrical Contractors' Association (Birmingham Branch).—Ordinary meeting.

Thursday, September 12th—Saturday, September 28th.

Shipping, Engineering and Machinery Exhibition.—Olympia, London.

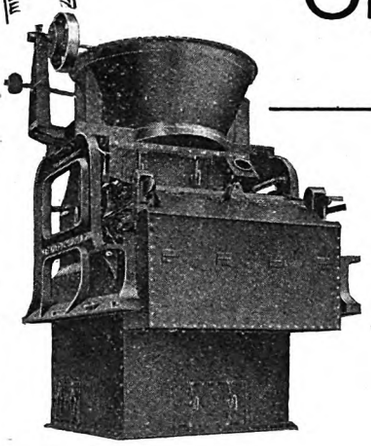
AVERY

ECONOMY IS BORN OF KNOWLEDGE.



AVERY PATENT
AUTOMATIC WEIGHER
FOR PULVERISED FUEL
LIST 1177.

The Avery No. 52 Automatic Weigher for Pulverised Fuel gives without dust escape, correct records of fuel consumption. The machine illustrated weighs 50 tons per hour from an Overhead Storage Hopper, and delivers to the pump. Thus, accurate records of fuel consumption are automatically kept, losses are instantly detected and economy achieved.

The Specialists in handling, weighing and blending machinery. Complete plants supplied.

Blackburn Again!

READERS, and especially those engaged in the municipal electricity supply field, will remember the remarkable series of pin-pricking experiences through which Mr. P. P. WHEELWRIGHT, the engineer and manager of the Blackburn Electricity Department has passed during the past few years, and will doubtless know what construction to place upon events of still more recent occurrence. The trouble, so far as we are able to judge, started in 1925, when a councillor who set himself up as a critic of the electricity undertaking was prevailed upon to put his criticisms into writing. This he did to the tune of twenty questions or so, to which he received duly suitable answers. These, however, generated seventeen more questions, and as this geometric progression bade fair to become endless, the borough auditors were called upon to prepare a report on the undertaking. Their findings amounted to a vindication of the electrical engineer, but the contention of the critics that in supplying electricity in bulk to Darwen, Blackburn was giving something for nothing, seems to have remained a sore point. The electrical affairs of Blackburn again became public property about the end of 1927, when, following a virtual recapitulation of the former complaints, Messrs. Handcock and Dykes were asked to report on the undertaking. The result again was a complete vindication of the technical efficiency of the undertaking to which Mr. WHEELWRIGHT has devoted 25 years of his life. The inquiry clearly showed that the whole trouble was on the financial side, the interest and sinking fund charges being out of proportion to the output of the station, and the only conclusion to be drawn was that the blame for the position definitely rested with the Electricity Committee, and not with the electrical engineer. The report also drew attention to the unwieldy size of the Electricity Committee—which then numbered 22 members—and to the fact its meetings only occupied 15 minutes a month. The independence of the source of this report naturally ensured its acceptance, and it was hoped that its lessons would be taken to heart. Unfortunately for the public of Blackburn, they were not, for quite recently the old troubles cropped up again, and a special sub-committee was set up by the Electricity Committee to inquire into the organisation and management of the Electricity Department. So far as we have been able to discover, no specific charge was made against the engineer, but this sub-committee recommended, and the Council has agreed, that the organisation and management of the commercial side of the undertaking are unsatisfactory, that the services of Mr. WHEELWRIGHT be dispensed with as from September 30th, and that he be paid one year's salary in lieu of notice. This decision was made despite the strong letters of protest from the Association of Local Government Officers and the Associated Municipal Electrical Engineers, who both asked for a public inquiry, and there the matter apparently ends, for it is obvious that a body which is competent to engage a man is perfectly free to dismiss him for any reason it likes. The question "Is it cricket?" was apparently not worth consideration.

Administration of Municipal Undertakings.

THE position at Blackburn exists, in embryo at least, in certain other towns, and under the present system of municipal administration—if system it can be called—we fear the trouble will spread. Surely the time has come for frank recognition of the fact that unwieldy bodies of laymen, whose opinions are apt to be dictated by considerations of local party politics, are not good enough for a great and developing industry like electricity supply. The suggestion has already been made that the Electricity Committee, as such, should be replaced by a small panel of business men, forming an *ad hoc* body, the executive and administrative board of which would correspond to the boards of directors of private concerns, the local authorities themselves corresponding to the shareholders. In this way, existing geographical difficulties could be overcome by making a single executive responsible to more than one local authority, as shareholders. Membership of these executives would be decided on business and technical efficiency rather than on the representation of interests—consumers' or other—and salaries and other financial considerations would be such as to facilitate the maximum exchange of the officials between different undertakings. There are many difficulties in the way of such a plan, but we do think that something of the kind is definitely needed to place municipal administration on a more businesslike basis. If the Blackburn trouble does nothing more than promote action along these lines, it will not have been altogether valueless.

Water Power in Japan.

THOSE who have studied the Japanese technical Press will probably have noticed the difference of opinion that exists as to the sufficiency or otherwise of existing electricity supply undertakings. We hear, on the one hand, of big

Digitized by Google

enterprises going forward to meet demands expected in the near future, and, on the other, of large projects held in abeyance because a sort of glut of electricity is feared. The latest news to hand regarding water power development is of a similar nature. One paper contains a statement that " the five big water power corporations have jointly applied to the authorities to obtain permission to postpone the development of new hydro-electric power for five years, in order to meet the threatening over-supply of electricity." Yet the same paper also records a proposal by the Toho Electric Power Co. to develop five sites along the Kanko River and two sites along the Yokusen River having an aggregate generating capacity of some 200 000 kW.

The Shipping World and Electrification.

If anyone requires to be convinced of the penetration of electricity into the maritime world, then an early visit to the Shipping, Engineering and Machinery Exhibition, at Olympia, is recommended. Steam has for so long claimed attention in the shipping branch of engineering that, with the exception of all-electric ships, the man-in-the-street is inclined to believe that the only application for electricity to shipping in general is that of lighting. For this reason the Olympia show may be regarded from the electrical point of view as a form of propaganda, for there the general public will learn of the many ways in which electricity is supplanting mechanical and steam-operated methods of control afloat. Apart from the obvious uses such as wireless communication, forced draught by electric fans, the driving of winches by electricity, etc., the megaphone has been replaced in many vessels by the " noise-proof " telephone, while the taking of soundings by electrical means is another application. Engine room and bridge are becoming more and more akin to each other, and whereas in the past the engineer and the deck officer have been in many cases social enemies, present day developments are such that the common ground of electrical application will soon produce a type of seafarer who, if need be, could lend a hand both above and below the water line.

Railway Electrification.

The Minister of Transport's decision to appoint a Committee to examine into the economic and other aspects of the electrification of the railway systems in Great Britain, with particular reference to main-line working, is one that we can welcome, even if we are not able, on our present knowledge of the problem, to anticipate an overwhelmingly pro-electrification report at the end of the inquiry. Suburban electrification in practice has more than justified the hopes of those who had the courage to proceed with it in the proper way. But, so far, only one railway has made any real progress in this field and there is much suburban electrification still to be done, and we hope that this localised question will not be lost sight of merely because the Government Committee is investigating main-line electrification. It is officially pointed out that the appointment of the Committee will in no way interfere with or delay any particular schemes of suburban or other electrification which may be otherwise under consideration, so that the railways will have no excuse for shelving the urgently needed suburban conversions which have long been beyond the scope of any inquiry. Anxious as we naturally are to see an extension of electrification to the main-line railways of this country, we are not sufficiently optimistic to believe that this or any Committee will materially speed up progress in this direction. If it does we shall be agreeably surprised. What we do expect, however, is that the work of this Committee will revive interest in main-line electrification, and, if the electrical world can only take advantage of this interest to convince the railways of the economic benefits derivable from an electrification policy, real development will be possible. Although the engineering policy of most of our railways is still, in our view, unduly dominated by mechanical engineers with a more or less pronounced bias against electrical working, the desirability of having an electrified system is more widely acknowledged to-day than it was even five years ago. The chief remaining obstacle is the economic one, and as the railways are now, more than ever, compelled to look first to the financial side, it is to this aspect that the most thorough and dispassionate examination must be directed. The constitution of the Committee is such that suggestions of pro-electrical sympathies are not likely to be made. On the contrary, the failure to include even one expert on railway electrification is one that is difficult to explain.

Building Research.

The building trade is to be congratulated on its appreciation of research work and more particularly on its application of electricity thereto. The latest development with a view to economy in the building of houses is the installation in a special house at Garston, near Watford, of an apparatus consisting mainly of recording instruments which, responding to variations of atmospheric temperature, operate electric heaters through relays. The purpose of the apparatus, we understand, is to permit of observations, in conditions closely resembling those of the interior of a small house, of the effect of sunshine on a roof, the flow of air through an outside wall, the effect of flues, wall ventilators, etc., and the electrical equipment is required to maintain an even temperature, control being obtained by atmospheric variations on a copper cylinder bringing into circuit the remainder of the apparatus. It is stated that the result of these observations will permit of the building of houses which will more effectively insulate their inmates from cold winds, heat waves, etc. It has, we understand, already been discovered that winds approaching 15 miles per hour cause air to pass steadily through a 9 in. outside brick wall at the rate of 8·5 cubic inches per square foot per hour !

Electricity Doomed !

News to hand from New Zealand makes it apparent that before very long electricity will be almost as obsolete as paraffin and gas, for two research workers at Christchurch have discovered a new force called Chromadyne, which is claimed to be " ten times more powerful than electricity." Though this startling discovery is only put forward as being an important feature of work which has led to the development of an electro-magnetic process which transmutes certain elements into gold, its possible effects on the electrical industry would seem so devastating as to suggest that we should all pack up and begin to look around for employment offering more stable prospects. For the moment no details are available beyond those we have given, though the discovery is said to be the subject of investigation by the New Zealand Government. We must therefore await, with such a show of patience as we can assume, a full account of the great new force and the price at which it will be found possible to supply per unit.

Our Youthful Octagenarians.

It is certain that those who originated the " too old at forty " theory were not acquainted with the outstanding exceptions in the electrical industry, which still has as active members a goodly number of men who are nearing or have exceeded twice that age. Some of them are so youthful in appearance and behaviour that it would be a shame to draw attention to their calendar ages by mentioning their names here. The need for discretion is, however, less obvious in the case of Col. Crompton—who has just entered into partnership with Dr. A. Ekstrom, to act as consultants on agricultural electrification problems—as his exact age is well known. That such a pioneer as Col. Crompton, who has been associated with so many important developments right from the earliest days of the electrical industry, should still be able to apply his fund of experience to one of the big problems of the future is a hopeful augury for ultimate success in this field.

INSULATED MAGNET WIRES.

The Properties, Development and Uses of Enamel, Cotton, Silk, Artificial Silk, Paper and Asbestos Coverings—Some Useful Tests.

By A. R. DUNTON, A.M.I.E.E., and A. W. MUIR, D.S.O., M.C., B.Sc.

AN examination of some of the earliest examples of electrical apparatus shows clearly that one of the serious difficulties confronting the pioneer designers was that of obtaining suitably insulated conductors. In many instances the only available means was a wrapping of tape. The position to-day is very different, for there exists a large variety of types and grades adequate even to exacting requirements, and from these a suitable selection can usually be made for any particular purpose.

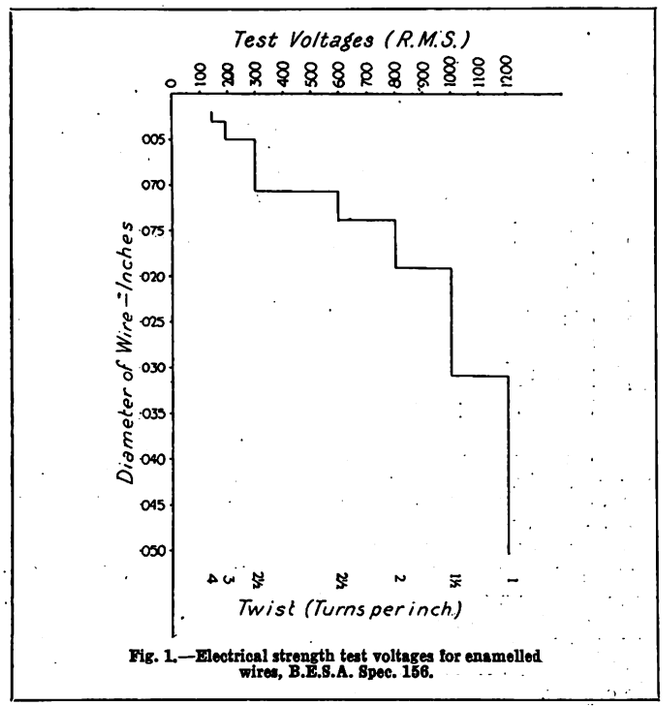

Fig. 1.—Electrical strength test voltages for enamelled wires, B.E.S.A. Spec. 156.

The materials which are commonly used for the insulation of magnet wires, and which are here reviewed, are enamel, cotton, silk, artificial silk, paper and asbestos. The insulation may be in one or more layers according to the space available and the insulation value required. Table I is a list of the insulation coverings most generally recognised, arranged in order of thickness of insulation.

Lack of Standardisation.

In view of the fact that insulated conductors are an essential item in practically all electrical apparatus, it may seem strange that, except in one instance, standard specifications for them do not exist. Some reason for this lies in the large variety of wires available, and the fact that the leading manufacturers are willing to produce almost any size of wire to private specification. In such circumstances it is only natural that electrical designers do not press for standardisation, preferring the free field for selection of special sections with a view to maximum efficiency of apparatus. The preference for special sizes is more marked with regard to the ribbons of rectangular section. With ordinary round conductors there is little excuse for the lack of specifications except the difficulty of selecting for standardisation any one of the existing gauges. These gauges, of which three are in common use in this country and seven or eight more abroad, have designation numbers which bear no direct relation to each other, or, which is more important, to the exact size of wire, and are thus a continual source of confusion.

The only B.E.S.A. specification at present issued for insulated wires (No. 156) is based on B.E.S.A. specification No. 128, which relates to bare annealed copper wire. In these specifications the sizes of wire are designated by their actual diameters expressed in decimals of an inch, a method much preferable to the use of arbitrary numbers.

While the selection of wire sizes remains to be settled at some future date there seems to be no reason why recommendations should not be issued concerning the various coverings and the performance which may be expected of them under various conditions, and it is to be hoped that the preparation of such recommendations may shortly be undertaken. In the following notes an attempt is made to review some of the more important features, and the present state of development of the materials used.

ENAMELLED WIRES.—These find extensive use, especially for work in which the space is very limited, as, for instance, the coils of telephones, meters, relays and very small motors, and to some extent on larger sizes of apparatus. The process of enamelling consists of passing the wire through baths containing the enamel, and thence up through heated towers in which, as it travels, it is baked at a temperature of about 600 deg. C. This high baking temperature, being only slightly below the annealing temperature of copper, is the cause of considerable difficulty, especially on the thinner sizes, because the wire stretches easily during the process, and thus both diameter and electrical resistance are reduced. Another trouble is the liability to formation of pinholes in the coating. This trouble has been attributed in part to the accumulation of small copper particles in the baths, and considerable improvement has been effected by subjecting the enamel to a constant filtering process. In most instances a single coating of enamel is given, but in some cases where an extra thick coating is specified the process is repeated.

TABLE I.—APPROXIMATE INSULATION THICKNESS OF VARIOUS COVERING ON WIRE OF 0·040 IN. DIA.

Type of Insulation.	Radial Thickness of covering (inch).
Enamel	0·0011
Single silk	0·001
,, ,, on enamel	0·0017
Double silk	0·0018
,, ,, on enamel	0·0019
Superfine single cotton	0·002
,, ,, ,, on enamel	0·0025
,, double cotton ,, ,,	0·003
Ordinary single cotton	0·003
,, ,, ,, on enamel	0·0035
Superfine double cotton ,, ,,	0·0035
Ordinary ,, ,,	0·005
,, ,, ,, on enamel	0·0055
Paper	0·0055
Asbestos	0·0055
Triple ordinary cotton	0·007
Asbestos tape and single cotton	0·007

Two electrical tests are required by the B.E.S.A. Specification. In one test two 16 in. lengths of the wire are twisted together, and the test voltage at any frequency between 25 and 100 cycles is applied between the two strands for 30 seconds. The twist and the test voltages for the various sizes of wire are shown in Fig. 1.

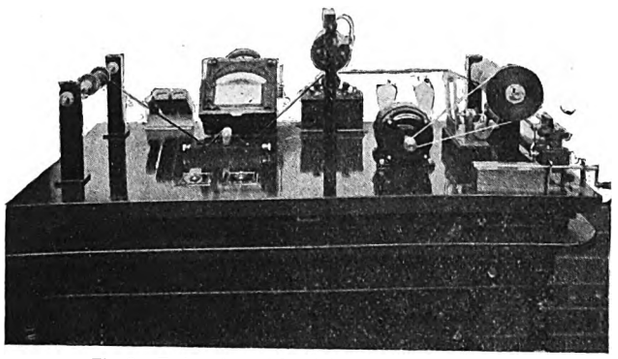

Fig. 2.—Test equipment for pinholes in enamelled wire.

The second specified test is for pinholes or cracks, and calls for a sample of wire not less than 50 yd. long to be drawn through a mercury bath ⅜ in. long, a pressure of 6 V d.c. being applied between the wire and the mercury. Not more than 40 contacts are allowed in any 50 yd. length. An apparatus used by the Automatic Telephone Manufacturing Co. for this test is shown in Fig. 2.

Digitized by Google

Great improvements in the manufacture of enamelled wire have taken place since the specification was issued, and the pinhole test is now often made at 50 or even 100 V with satisfactory results, showing that the requirements might well now be strengthened with regard to both the voltage and the number of permissible failures in this test.

An examination of the enamelled wires generally offered

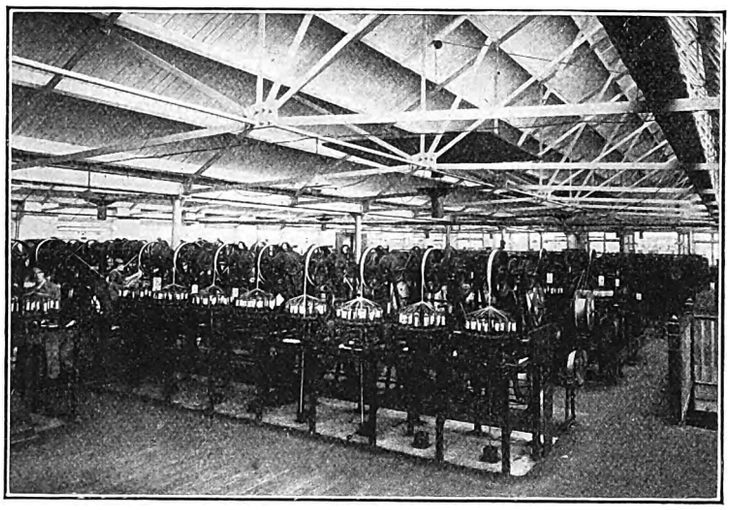

Fig. 3.—The braiding of armature wires at the London Electric Wire Co.'s works.

indicates that two distinct classes of varnish are used, one having a resin base and being distinguished by its lighter colour in comparison with the black of the bitumastic base varnish. The light varnish may, however, appear quite dark in thick coatings. A general preference exists for the lighter coloured covering.

Impregnation Problems.

Impregnation of enamelled wire coils is not often carried out, and it is undesirable without special knowledge of the materials. For this reason it is well in any instance to seek the advice of the wire manufacturers, who will either offer a special enamel or recommend a suitable impregnation. The necessity for impregnation can often be eliminated by using a layer of impregnated paper or varnished silk between layers. Impregnation is often called for when all that is required is a surface protection or seal against the penetration of moisture, as, for instance, for service under tropical conditions.

With regard to the use of enamelled wire a further point of importance is that while " wild " wound coils of this material may often be used satisfactorily on direct current supplies, their use on alternating current supplies is rare and generally undesirable, since in a.c. service a short circuited turn or turns will cause intense local heating through auto-transformer action. When used for such service enamelled wire should be wound in even formation with additional insulation between layers.

Silk-covered Wires.—These are used chiefly where economy of space is essential, together with greater reliability than can be expected with enamelled wires. The silk covering has a radial thickness less than any other fibrous covering, and therefore finds useful application for such items as smaller

Table II.—Variation of Thickness of Silk Coverings, with diameter of wire.

motor windings and other small coils, especially for a.c. service. In most other respects it is inferior to cotton ; it has poor mechanical strength and resistance to abrasion ; it does not withstand temperature so well, and it does not absorb impregnation materials so effectively. This latter point is of some importance, since, like cotton, silk is hydroscopic, and in many applications requires a sealing of varnish.

The silk covering, like the cotton covering, consists of a number of filaments in parallel laid side by side to cover the bare copper or other conductor completely, by one layer in the case of single silk covering or in the case of double covering with the addition of another complete layer applied in the opposite direction. Further to the statement given in Table 1 it should be noted that the radial thickness varies with the diameter of the wire and in the case of silk represents additions to diameter as shown in Table 2.

Most silk coverings are very uniform. The silk is capable of being dyed almost any shade, but a dark green colour is most usually adopted and is preferred by most coil winders as it tends to reduce the eye-strain which often results from the use of fine wires for hand-wound coils. The dyes used are generally soluble in most of the impregnating and coating varnishes, a point which should be considered, if varnished coils of attractive appearance are desired. On account of the deterioration of the silk at high temperatures, any impregnation should be carried out at only moderate temperatures, and drying temperatures should not exceed about 120 deg. C.

Cotton Covered Wires.—Cotton coverings are applied as has been described for silk. Fig. 3 shows one of the factory operations of the London Electric Wire Co., illustrating the use of braiding machines by which an extra protection is given to wires for some special applications such as armature leads. The coverings are of two kinds, ordinary cotton and superfine cotton. With the latter it is possible to obtain a double covering of radial thickness not exceeding that of the ordinary single cotton covering, but the material being finer and specially selected, makes the superfine grade more expensive. The radial thicknesses of the common types of cotton covering, increasing with the diameter of the wire, are shown approximately in Table III. For the most commonly used type, the double (ordinary) cotton covered, Fig. 4 shows the percentage increase of weight to be allowed for the covering, a factor to be considered in cases where large consignment purchases are influenced by fluctuations in the price of copper.

The soft texture of the cotton gives it good covering power and produces a good bedding and cushioning of the windings. Good specimens of cotton-covered wires should be capable of being bent round a diameter equal to ten times that of the bare wire without the strands parting sufficiently to show the copper.

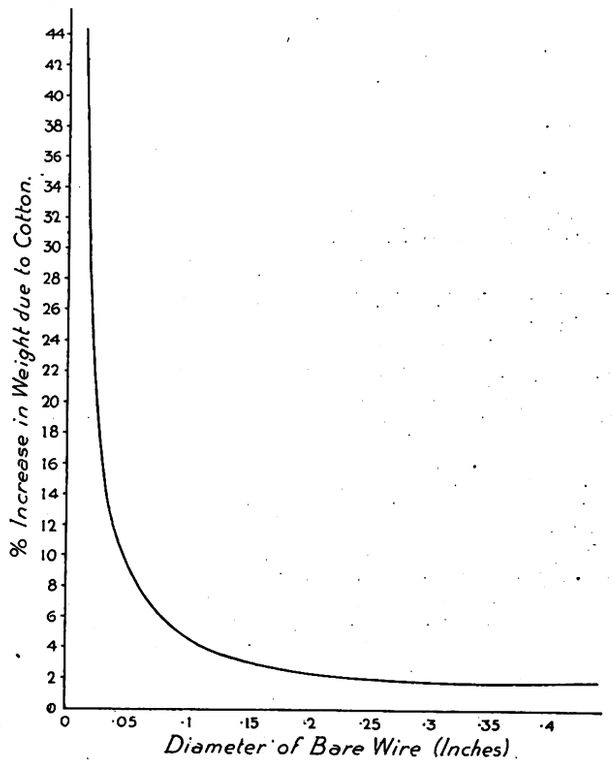

Fig. 4. Indicating increase in weight due to cotton with wires of different diameters.

Cotton-covered wires are the most popular for impregnation purposes owing to the absorbency of this covering for the impregnating varnishes. For many applications a further point of importance is the fact that, with the sole exception of asbestos, the cotton covering withstands most effectively the high temperatures met with in some electrical apparatus.

ASBESTOS COVERED WIRES.—The main feature of asbestos insulation for this, as for other purposes, is its maintenance of electrical strength under conditions of high temperature.

0·132 —0·212			0·018—0·021

There is practically no difference between the results of electric strength tests on asbestos-covered wires under normal conditions at 20 deg. C. and at about 180 deg. C., and while the limit temperature for motors and generators is generally assumed to be 90 deg. C., there are cases on record of machines with asbestos insulation having been run for years under severe overloads at temperatures for which cotton-covered wire would have been quite inadequate.

Considerable improvement has recently been made in asbestos-covered wires, and these can now be obtained in either black or white finish with a radial insulation thickness not greater than that of ordinary double cotton covering. Until recently asbestos coverings usually took the form of thin asbestos tape wrapping, and this process is still used for large conductors and for conductors of rectangular section. For small conductors, however, the radial thickness of the insulation by this method is excessive owing to the overlap of the tape at each turn. In an improved process for producing a thinner covering the wire is first passed through a bath of binding medium and then through a chamber in which finely divided asbestos is kept in a state of agitation by draughts of air. The wire, with the covering of particles which have adhered to its moistened surface, is then passed through dies to compress and smooth the coating, which is sometimes secured by a spaced winding of single cotton thread.

The chief objection to the use of asbestos for wire insulation is its comparatively high cost, which is usually about 50% above that of cotton. There is little doubt however, that, if a more general use were made of the material a great decrease could be made in manufacturing costs, not only of the

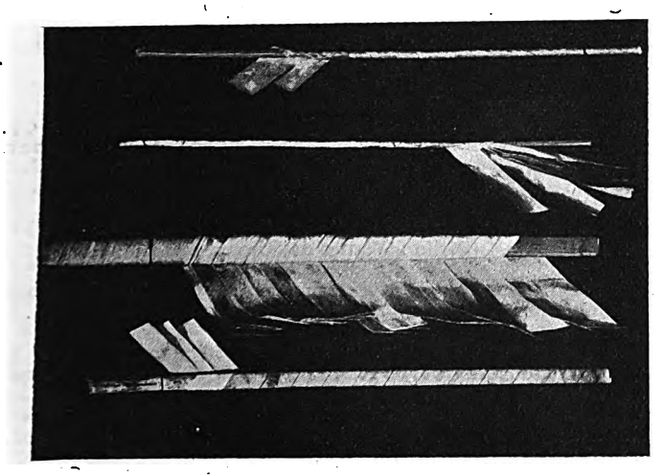

Fig. 5.—Paper insulated wires and ribbons.

insulated wire but also of electrical machines, if the higher operating temperatures which would be practicable with such insulation wire permitted.

PAPER INSULATED WIRES.—At one time the use of paper for the insulating of wires was practically confined to cable manufacture, in which its application has proved very successful. This success, together with the many excellent qualities of the material as a wrapped insulator, have in recent years led to its adoption for small single conductors, especially for use in oil as transformer windings, and especially for high voltages, and its use in this connection may now be regarded as well established.

In using paper-covered wires care should be taken to benefit by the experience of the cable makers, most of whose specifications demand either pure manilla paper or a mixture of pure manilla and a specially selected chemical wood pulp

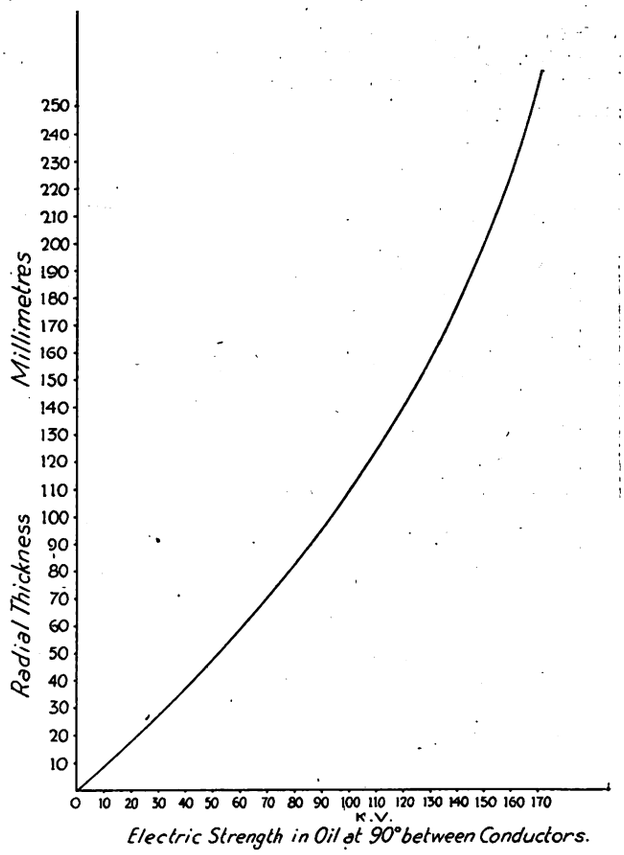

Fig. 6.—Results of electric strength tests on paper insulated wires bent round twice the overall diameter.

paper. A very interesting report has been prepared by the Underground Systems Committee and issued by the National Electric Light Association of America, dealing with the rate of deterioration of impregnated wood pulp paper. The tests recorded in this report cover a period of 48 weeks and show remarkable maintenance of properties—a feature of great importance in view of the fact that much of this type of insulated conductor is being used for large power transformers, including those now being built in this country for the 132 000 V grid schemes.

As illustrated in Fig. 5, the paper insulation is built up to its required thickness by winding a number of paper ribbons from reels which are mounted on a rotating frame or frames through which the wire passes. By this means exact displacement of the turns and the layers is obtained. The paper should be of good non-ageing, mechanically strong, yet absorbent character. Each layer should be staggered with reference to the layers immediately adjacent to it. The turns of the final layer should be overlapped on themselves to prevent the paper unwrapping itself when the wire is cut. The turns of each inner layer should butt exactly without overlap, this being particularly important for the multi-layer varieties. Some of these have as many as 50 or more layers, giving a radial thickness of as much as 0·25 in., and in such cases, or even with fewer layers, the overlapping of inner layers tends to bind the turns and prevent them from giving the slip requisite in bending, with the result that the paper is strained or distorted. For the same reason windings in different directions are undesirable.

Fig. 6 shows the results of electrical strength tests in oil at 90 deg. C. on paper-insulated wires bent round a diameter equal to twice the overall diameter of the insulated wire. For less severe conditions of test an increase of about 18% on these values can be obtained.

BOOK REVIEWS.

Speech and Hearing. By HARVEY FLETCHER. With an introduction by H. D. ARNOLD. (London: Macmillan and Co.) Pp. xv+331. 21s. net.

This fascinating book will be of great help to telephone and radio engineers on an aspect of their work which is a closed book to many of those who are engaged in the design of this apparatus. The present volume is really the outcome of a comprehensive survey of speech and hearing inaugurated some fifteen years ago in the research laboratories of the Bell Telephone System, to obtain the fundamental facts on which to base the design of apparatus and systems for telephone use. As the work proceeded it was appreciated that better and more precise instruments must be developed, and thus a large part of the effort was directed to the evolution of devices which would convert sound waves into electrical form and re-convert them again to sound with the least possible distortion. This work brought unexpected rewards in the shape of immediate valuable applications to the telephone and talking machine industries. In any properly visualised fundamental research some unlooked-for applications will usually arise, but the magnitude of the results which followed the adoption of the devices produced by these experiments to the phonograph, to radio, and to the deaf could hardly have been visualised by the most ardent supporter of speculative research.

LIGHTING HOTEL EXTERIORS.

AN attractive exterior lighting scheme adopted by the East African Power and Lighting Co. at a Nairobi hotel. The lighting on the balcony by the use of short standards provides a setting which might well be utilised in the lighting of hotels in England.

The work is not yet complete, though the progress made in some directions has been remarkable, and all interested in the engineering side of problems of speech and hearing will certainly find in this book considerable food for thought. The volume is conveniently divided into four parts:—speech, music and noise; hearing; and the perception of speech and music. R.C.

Electrification of Steam Railroads. By KENT TENNEY HEALY. (London: McGraw-Hill Publishing Co.) Pp. xiii +395. 25s. net.

It is hardly an exaggeration to suggest that one of the greatest obstacles to the spread of railway electrification has been created by some railway electrification enthusiasts with their "electrify at all costs" theories. Such enthusiasts—and the reviewer has been one—have been so concerned with the advantages of electrical working that they have either disregarded or discounted important economic considerations. Mr. Healy's book opportunely comes to put us right on these matters, and his chapters on the general economics of electrification and the economics of motive power are worthy of careful study. As the author himself points out in his introduction, the extreme cases in railway transportation that demand electrification have all been turned over to electrical operation, and further progress must depend upon the presentation of a development that is definite in its results, refined and standardised in its design and reasonable in its cost. As this point is approached the problems of electrification tend to emphasise the economic engineering relationship of the development to transportation rather than the engineering phases of the development itself. The improvements made by competitive means of transport while electrification was in the development stage are also of importance. Improved locomotive design, with better heat utilisation and better conversion of steam power into tractive effort, have helped the railways to increase the return on their capital by investing in improvement of existing methods rather than in electrification. If electrification is to develop further against this competition it will be all the more necessary to effect economies in design and operation with the result that the economic becomes of even greater importance.

The author does not deal entirely with economics; some sixteen chapters are devoted to operational and constructional matters, but through all the economic viewpoint is discernible. After dealing with the source of and contracts for power for electrical operation, the author deals with sub-stations, distribution switching and sectionalising, overhead supporting structures, overhead contact and rail distribution systems, collection of current for the distribution system, traction motors and the control of current thereto, transmission of power from the motors to the driving wheels, and the mechanical elements of locomotives.

There are also useful chapters on the co-ordination of traction, circuit stray electric fields, general problems of motive power, and organisation and personnel for electrical operation.

R. T. L.

Radio Telegraphy and Telephony. By RUDOLPH L. DUNCAN and CHARLES E. DREW. (London: Chapman and Hall.) Pp. x + 950. 37s. 6d. net.

In attempting to cover the field indicated in the title and to make it a complete text-book for students, technical and non-technical, the authors have set themselves a task which would appear to be difficult even in a work of 950 pages. They appear, however, to have done their work both thoroughly and well, and they take the reader, with frequent useful analogies, from first principles up to the present complex application of those principles.

Mr. Duncan is director of the Radio Institute of America, where Mr. Drew is instructor in radio and in charge of the Electrical Division. Differences in terminology may therefore be expected. In most cases the terms used, such as "vacuum tubes," are familiar to, though not used by, English engineers. Some data regarding American receiving and transmitting valves which is included in an appendix is of little interest in this country.

DEVELOPMENT OF INSULATING OILS.*

Historical Features Reviewed—Some Unsolved Problems—The Evaluation of Sludging Characteristics—Co-operation with Oil Refiners—Drums and Tank Wagons.

By C. B. SKINNER, Fel. A.I.E.E.

THE integrity of modern transformers and circuit breakers, which are essential features of all transmission systems, is due in no little measure to the insulating oil now universally used in such apparatus. While the oil is a relatively minor part of these devices as a whole, its failure will mean the failure of the apparatus. This is increasingly true as the voltage of the transmission systems is increased. The service rendered by the oil used as an insulating medium in electrical apparatus is radically different from service rendered by oil in any other class of service, and there are rigid requirements for oil for this service which do not exist where oil is used for other purposes. In fact, insulating oil may be considered a material of construction rather than a material of maintenance.

The history of the development of transformer oil begins with the first high-voltage transmission lines in the early '90s, and a continuing and increasing amount of research has been required from that day to this to meet the ever increasing demands for quality and service. The electrical manufacturers' representatives who have been responsible for the quality of the oil used in transformers, have faced many difficulties and have experienced much grief from time to time, due to troubles for which the oil was either directly or indirectly responsible. The fact that such difficulties are rare at the present time does not indicate that further attention to this important material is unnecessary, but, on the other hand, it does indicate that a full knowledge of the difficulties which have been so disturbing in the past and a constant watchfulness have mitigated these difficulties to a point where the modern transformer gives perhaps less trouble than any other piece of apparatus in the transmission system.

It may be useful to review some of the history of the development of modern insulating oil and to indicate some of the problems still unsolved, so that a full appreciation by those responsible for the purchase and use of transformer oil may be had. This history may be divided into various chapters, each concerned with the items which seemed to be the cause of the major difficulty prevailing at each particular stage of the development.

When the study was made of oil which might possibly be suitable for the insulating and cooling of the transformers to be used on the Pomona transmission line, this being the first constant high-potential transmission line undertaken in the United States, the study included oils of a very wide variety. Mineral oils, from the heaviest cylinder oil to the equivalent of gasoline and benzine, were carefully studied. Similar tests were made of quite a number of vegetable oils, such as linseed, rosin oil, etc. These early tests were almost entirely on the basis of the determination of dielectric strength. In making these studies, glass containers were used, with the testing electrodes immersed in the oil in a horizontal position. It was observed that any foreign matter visible to the naked eye would line up between the testing electrode and materially reduce the dielectric strength upon the application of the testing voltage, and this at once showed the necessity for extreme care in keeping oil free from foreign matter, such as dirt, fibres, carbonised oil, etc. The necessity for cleanliness has been emphasised again and again with each major increased step in transmission voltages.

The Age-old Tradition.

In these same tests it was discovered that oil which had been heated in an oven for a considerable period had a much higher dielectric strength than the average oil delivered from the oil manufacturer. There is, of course, the age old tradition that oil and water will not mix, but there seemed no possible explanation for this increased dielectric value of the oil other than that it was due to the elimination of moisture, and that oil was subject to the same difficulties in this regard as most of the other materials of insulation, which, at that time, had already begun to be studied in considerable detail.

To test the theory (which from the ancient tradition seemed more or less absurd) that moisture was responsible for the low dielectric value of many oils as delivered, and their changed value on continued heating, the following test was made :—

An extremely small amount of water in increasing quantities was added, each addition being a fraction of a drop per gallon of oil, the oil being very thoroughly agitated after each addition. This gave undoubted evidence that very minute amounts of water in the oil would cause radically decreased dielectric strength. This has been checked again and again during the intervening 35 years, and more drastic precautions have been found necessary from time to time as the voltage of transformers has been increased. In fact, it has been found necessary to go to the precaution of treating, not only insulation of the transformer to eliminate moisture, but the whole structure, iron-core frame, etc., and to see that the oil which is introduced, especially in transformers for the higher tension, is, as we now say, absolutely dry.

Drying Methods.

The method of drying oil in the early stages of the transformer oil development was accomplished by giving it an extended heating at moderate temperature ; but, it was later found that although the temperatures used were relatively low, sufficient oxidation might be started to affect the endurance of the oil against sludging in service. This led to an investigation of other methods of drying and cleaning the oil, and this is now accomplished by various filtering and centrifuge processes. The requirement is that all suspended matter and all traces of moisture be removed. This is a difficult matter, due to the fact that while the ordinary refining process results in practical elimination of all free water the final moisture to be removed is apparently in solution in the oil.

In the early construction of transformers, the enclosing cases were frequently made of thin material with deep corrugations and with wooden tops, these wooden tops being used for giving added insulation to the outgoing leads. After experience with a number of disastrous fires with constructions of this kind, the underwriters demanded oil having the highest possible flash and fire test, consistent with satisfactory transformer operation. As a result of this requirement, new studies were made and heavier bodied oils adopted. At the same time, attention was given to a better mechanical structure for the transformer cases. The use of this heavier oil resulted in more sluggish circulation and consequently poorer cooling, and apparently little or no decrease in the fire hazard so far as the oil itself was concerned. Soon after this change was made a new and unexpected phenomenon appeared, and this phenomenon is now generally denominated as sludging. This has been, perhaps, the most difficult matter to deal with that has arisen in connection with transformer oil.

It was soon discovered that a lighter and more fluid oil was in general less subject to sludging than the heavier oils adopted to minimise the fire hazard ; but the adoption of these lighter oils merely minimised and did not cure the sludging trouble. As the units became larger and service more difficult, the sludging trouble increased to a point where transformer manufacturers and users found themselves in more or less continual trouble, and very extended studies were made to determine the cause and cure of sludging.

To date, however, no oil has been found which will not deposit sludge if the conditions of its use are sufficiently severe. By very careful selection and by eternal vigilance on the part of the oil refiners and the transformer manufacturers, oil has been produced which, under all modern operating conditions, is sufficiently free from sludge to give satisfactory service.

Unfortunately, no test has yet been devised which will quickly determine whether or not oil will be free from sludging in service, although an enormous amount of experimental work has been done and many tests have been proposed and used. This question has been considered of sufficient importance to warrant the co-operation of all the nations interested in the production and use of transformer oil to determine, if possible, a satisfactory sludging test. For this purpose, and working through the International Electroctechnical Commission, duplicate samples of oil have been submitted to laboratories of half a dozen or more countries and extensive tests have been entered into for this purpose. At the meeting of the International Electrotechnical Commission in Bellagio, Italy, in October, 1927, the report of the various committees and laboratories which have been working on this question for two or three years, was to the effect that the various tests

* From a Paper presented at the Pacific Coast Convention of the A.I.E.E., Santa Monica, California, September 3rd–6th, 1929.

Digitized by Google

were conflicting in that one test might indicate that a given oil was satisfactory, while another test just as strongly defended might indicate this oil to be unsatisfactory.

The result of this meeting showed that additional work must be done in order to determine which of the half-dozen methods now more or less used would be the satisfactory one to evaluate oil with regard to its sludging characteristics, or whether an entirely new test must be devised. To date, the only safe procedure which has been found has been that of very careful laboratory tests combined with extended service tests, in many cases of several years, to bring the assurance that oil used would show a minimum of sludging troubles.

In the meantime, the oil refiners and transformer manufacturers, and some of the users of transformers, have been making continual studies, both as to the cause and elimination of sludging troubles, and for the securing of oil that would be free from this trouble and would meet all of the other rigid requirements for transformer oil to be used with the highest voltages.

An Accidental Discovery.

Through a pure accident, discovery was made fairly early in the study of insulating oil to the effect that free sulphur would very greatly impair its insulating value, and much study was given at one time to the effect of both free and combined sulphur in minute quantities in insulating oil. In like manner, the residual acids from the refinery treating, and other effects of processing the oil, had to be studied with each change in the refining process, to bring about the various characteristics necessary to meet the increasingly exacting requirements on this material.

The manufacturers of apparatus using insulating oils early found it necessary to establish intimate working relations with the oil refiners, and as they were required to meet one requirement after another, the refiners developed a special procedure from the selection of crudes in the fields through the final manufacturing process. The characteristics governing selection at the wells include such items as pour point, freedom from wax, amount of sulphur, etc. In some cases, special pipe lines are used to transport the crudes selected for the manufacture of insulating oils to the refineries, in order that contamination with other crudes shall not occur. During the preparation of the distillage by the vacuum process, rigid inspection for viscosity, flash, and pour point control is maintained, and where these oils require treatment with strong sulphuric acid or equivalent, special care is required to see that there is complete neutralisation and thorough washing of the oil, and this treatment is sometimes followed by redistillation in order to remove all traces of reaction products remaining after washing.

The advent of outdoor transformer and switching stations imposed an entirely new requirement of transformer and switch oil, namely, the necessity of a very low congealing temperature, or as commonly known, a low-cold test. Transformer oils which were found relatively satisfactory for the old indoor stations had a relatively high-cold test and consequently were not satisfactory for outdoor stations, particularly in cold climates. This requirement for a low congealing temperature is even more rigid in connection with oil switches, which must be free to operate at any temperature which may be reached in the climate where an outdoor switch may be installed.

This requirement for low-cold test oil demanded a whole new series of studies, as the general requirements for indoor apparatus, such as freedom from dirt, moisture, and relative freedom from sludging, etc., had to be maintained. In all such studies it had to be kept in mind that there was a constantly increasing demand for oil, and that any oil selected must be available in sufficient quantity to supply this demand. Fortunately, oil has been developed through the co-operation of the oil refiners and transformer manufacturers, which meets the previous requirements, as well or better than any which had been previously used, and which has a sufficiently low-cold test to be satisfactory for all ordinary outdoor service.

From almost the beginning of the development of oil for cooling and insulating apparatus, mainly transformer and circuit breakers, the transformer and circuit breaker requirements seemed to be sufficiently divergent, so that no single oil would be satisfactory for both services. Certain characteristics of these two services are in opposition to each other, while certain other desirable characteristics coincide. For example, all the early tests and service experience seemed to indicate that the circuit breaker required a relatively heavy and sluggish oil, while the transformer required as light an oil as possible, in order that it might have sufficient fluidity under all conditions to circulate rapidly and transfer the heat from the transformer windings and core to the outer cooling surface. Again, an enormous amount of experimental work was necessary to find an oil which would meet both these services sufficiently well so that utilities would not be required to carry two or three grades of transformer oil and one or more grades of circuit breaker oil. Several years of laboratory and field tests were carried on before there was sufficient confidence on the part of the electrical manufacturers to justify their making a positive assertion that an oil was available in quantity which had all the necessary requirements sufficiently well fulfilled to justify the stand, that this oil could be used as a universal oil for all insulating and cooling work in transformers and circuit breakers.

It has been found that the balance between the two services is very close, and that continued experimental work and the closest possible inspection and testing of oil of this class must be followed in order that the necessary characteristics may be maintained, suitable for all services and for all climates. The advantages of universal oil are so obvious that no arguments are necessary to justify its use.

Throughout the whole history of the development of oil for insulating purposes the question of shipping containers and storage arrangements has been found to be of the utmost importance. In the early days oil was shipped in wooden barrels which were made tight by the use of ordinary glue. This led to interminable trouble from the glue getting into the transformers and other devices, helping to reduce the dielectric strength and to increase the sludging characteristics. Seepage of the oil and the entrance of moisture were common difficulties with such containers.

With the introduction of steel drums a new kind of trouble developed. Additional dirt and scale was introduced into the oil, and it was soon found that the more rigid cleaning and inspection methods did not always eliminate such difficulties. When the use of oil arrived at a point where tank car shipments were necessary, still further difficulties (dirt and water) appeared. It was not at all uncommon in the early days to find a considerable quantity of water in the bottoms of the tank cars containing transformer oil. Condensation of moisture, both on the exposed surfaces of the tank cars and on the surface of the oil itself, were almost inevitable and imperfectly protected openings frequently resulted in additional trouble.

It had been assumed that steel drums with continuous lead washers under the bungs, would be both proof against seepage and proof against entrance of moisture, but this was found not to be the case, and the writer of these notes is familiar with a considerable number of cases where drums of oil, with bung-up exposed to the weather, were found to contain a considerable quantity of water, when it was absolutely certain that these drums were moisture free on shipment. This was apparently brought about by the heating and cooling of the oil due to the changes in temperatures, between day and night, the resulting pressure and vacuum helping the entrance of water at the bung when this would be covered by rain water.

The Oil Refiner's Task.

The oil refiner has accomplished, therefore, only a part of his necessary functions when he has prepared the proper grades of oil. These must be so handled after preparation as to deliver them in the cleanest possible condition to the ultimate consumer. Amounts of contamination which would be inconsequential in lubricating oils will cause no end of trouble in transformer oils, so that an entirely new scheme of preparation of packages and lines of special containers have been found necessary. Every container returned to the refiner must be most carefully inspected and put in such condition that it will not cause any of this contamination. The removal of rust and traces of foreign materials which have been stored in the containers, and every other kind of contamination must be absolutely removed, or the container is rejected and many rejections occur in the inspection of such returned containers. The time between the final cleaning and inspection of containers, and the time of filling with the transformer oil and sealing must be an absolute minimum.

Even with all the possible precautions taken, the practice of making individual inspection of oil in drums after allowing a suitable time for foreign matters to collect at the bottom, has been found essential.

There is, of course, involved the shipment of small packages ranging in volume from one to five gallons. Disastrous experiences were run into through the use of ordinary "run

Digitized by Google

of mill" tin cans in the early stages of the business. It later developed that the cause of this was the use of packages, the seams of which had been soldered with acid flux, and the latter material had worked into the cans with harmful results to the dielectric strength of the oil which the packages contained. This has resulted in oil refiners installing a special line of machinery for the manufacture of these containers under such control as to insure against the possibility of their becoming contaminated with materials which cause harm to the oil. Not only must these containers be manufactured properly, but they likewise must be tested for leakage and suitably dried before filling, after which they must be immediately capped with the specially designed fittings which have been brought out for this purpose only. Furthermore, it is necessary that inspection be made of a certain portion of the tin containers in order to insure that the quantity of the oil ready for shipment in these packages is running uniformly satisfactorily.

During a few months of the year, under carefully controlled conditions, insulating oils of good dielectric strength could be delivered in ordinary tank cars, but, because of the extreme difficulty of properly drying them before filling, it is unsafe to guarantee deliveries in these tanks at all seasons. As a result of this condition, special cars have been developed with steam coils surrounding the shell, these coils in turn being protected by wooden jackets covered and protected with heat insulating material and thin sheet iron. Only with such equipment as this has it been found possible properly to dry out the cars before filling to such an extent that delivery of dry oil at destination can be assured. With these cars it is possible not only to dry them out before filling is started but during this operation to maintain the temperature of the cars at such a figure as to assure freedom from contamination of moisture in the oil in the cars before the filling is completed and the cars sealed.

A specific example, involving serious difficulty, will be of interest. Serious operating trouble was experienced with some high-voltage circuit breakers, each containing over 3 000 gallons of oil. The oil in this particular case was not the standard usually supplied by the manufacturer. As a result of the difficulty the oil had to be completely replaced in an outdoor installation in severe weather, and in the final investigation the trouble was traced to faulty manufacture of the oil and to sloppy methods in its handling.

It was early seen that some sort of cleaning and drying apparatus was essential in connection with the use of oil in some quantity, as is required in the average power transmission station. Various schemes of filtering, drying, and cleaning oil have been devised. These included filtering through paper, unslaked lime and the application of heat and various other schemes. The plan which seems to give the best all-round results and is now quite generally used, is that of the use of a centrifuge type of cleaning device, often combined with a pressure filter. Extensive research work in connection with the universal oil referred to above, has shown that both the transformer and switch oil may often be reconditioned after it has become contaminated, to a point where it is unsatisfactory for use. Apparatus for this purpose is now manufactured and very specific instructions have been worked out for reconditioning and for testing reconditioned oil.

Parallel Work.

Parallel to the research work on the oil itself, many improvements have been made in transformer and circuit breaker designs to aid in eliminating the difficulties encountered in connection with the oil problem. It was early proved through research work that exposure of oil to the air very greatly increased its tendency to sludge, and that this increase with a given exposure was more or less a function of the temperature of the oil. This led to transformer case designs, which included the conservator type of case, and, more recently, the inert air scheme, which automatically provides in service for the elimination of both moisture and oxygen from contact with the oil in the transformer. While these devices have not changed the tendency of the oil to sludge under a given set of conditions, they have aided very greatly in changing service conditions, thereby inhibiting sludging and maintaining oil in a clean and dry condition.

The final result of all this work, which has extended over a period of more than 35 years, has been to make the modern transformer and circuit breaker with the universal oil, among the most satisfactory devices which goes into the modern equipment for the production, transmission, and utilisation of electrical energy.

A NEW METAL.

Substitute for Platinum in Radio Valve Manufacture.

THE development of a new metal known as "Konel," which is credited with being much stronger than other metals at high temperatures, and which can be used extensively in the moving parts of internal combustion engines and other hot locations, has been announced by the Westinghouse Electric and Manufacturing Co. following the granting of foreign patent rights.

Originally developed by the Westinghouse Research Laboratories as a substitute for platinum in the manufacture of filaments for radio valves, the new metal was discovered to be harder to forge than steel, and to be very tough at high temperatures, when most metals lose their strength.

The new metal was created by Dr. E. F. Lowry, a graduate of Ohio State University, and American engineers predict many uses for it. As a substitute for platinum, Westinghouse officials are authority for the statement that Konel already is saving approximately £50 000 monthly in the manufacture of radio valves.

Platinum costs approximately £36 per ounce, while the new substance costs only a few shillings a pound. The life of Konel filaments is said to be approximately ten times longer than that of other filaments. Valves with filaments made of the new metal are operated 175 degrees colder than tubes with platinum filaments but with the same emission.

WRINKLE FINISHES.

New Appliance Coating Composed of Resins and Processed Drying Oils.

A NEW decorative finish applicable to domestic accessories, and known as the wrinkle finish, is described by "Electrical Manufacturing" as a coating composed of resins and processed drying oils in balanced ratio which, on baking, forms a resistant surface of delicate traceries exhibiting an artistic textured effect to flush switch plates and other accessories.

Wrinkle finish may be used either in a single coat or with added coats of lacquer or enamel, and it may be produced in natural colour or with bronze or aluminium powders or pigments that give a wide range of shades. It is applied by spraying, and is hardened by baking. The baking temperatures for metal, glass, earthenware and similar objects vary between 180 and 400 deg. F., and the time of baking between ½ and 5 hours.

APPLICATIONS OF TIN.

Comprehensive Plan of Research on Industrial Problems.

A COMPREHENSIVE plan of research into the industrial applications of tin, including its properties as a preventive of corrosion and its economic use in the production of more efficient high-speed machine-bearings, has been announced by the Tin Industrial Applications Committee. The Committee was recently formed, in direct co-operation with the British Non-Ferrous Metals Research Association, to investigate the properties of tin, with a view to standardising its most efficient applications for industrial purposes, and to finding new uses for the metal.

"We feel," the hon. secretary stated in an interview, "that the line of investigation now being undertaken will develop a new and successful preventive of corrosion. The research into bearing metals is of equal, if not greater, importance, since the efficiency of all engines is dependent upon them. Researches are being undertaken in several other directions.

"The commercial value of such research is well illustrated by a recent discovery. It has been found that by mixing a small amount of tin with lead, and adding a smaller quantity of another non-ferrous metal, the strength of the lead was increased enormously, as was its resistance to corrosion and cracking. This new alloy will mean the saving of many hundreds of thousands of pounds a year to the electrical industry and the building trades."

Since the formation of the Tin Industrial Applications Committee was announced a few weeks ago inquiries and applications for membership have been received from almost every part of the world. American and British industries using tin are taking an active interest. The committee is in close touch with many of the principal United States tin-consuming industries.

ELECTROMAGNETIC TESTING FOR MECHANICAL FLAWS IN STEEL WIRE ROPES.*

Production of Electromagnetic Rope-tester Solves an Old Problem—The Main Principles of the System and its Application.

By T. F. WALL, D.Sc., D.Eng., M.I.E.E.

TESTING for mechanical flaws in wire ropes by means other than those which require them to be subjected to actual mechanical tension has been a problem of very long standing. Undoubtedly the ideal method for making such a test is a magnetic method.

No harm is caused to the rope by making the test, which can be made a routine performance without any interference with the rope itself or its fittings. The need for such a test is specially evident in the case of winding ropes of the locked-coil type as used in collieries, since an internal flaw may develop without any external sign being visible.

In the present paper the author gives an account of the researches carried out during the last two years, which have resulted in the development of a design of an electromagnetic rope tester.

Test-results are given which were taken on an actual rope specially constructed for the purpose, and in which hidden flaws were arranged. The method described makes it possible to detect in a rope broken wires which represent a flaw of less than 5% in the total cross-section.

Application of Method.

The application of this method for testing wire ropes is not confined to the winding and haulage ropes used in collieries. Other important uses are for testing the ropes used for cable trams, mooring-ropes for airships, and ropes used in suspension bridges, etc.

Briefly stated, the principle employed is to make use of a "search band of flux" which is linked with a search-coil system, and the disturbing effect on this search band of flux due to a flaw in the rope is shown by a corresponding change in the e.m.f. induced in the search-coil system.

For several reasons a.c. excitation is preferable to d.c. excitation. In the latter case the induced e.m.f. would be transient, whereas, with a.c. it will persist as long as the faulty portion of the rope is included in the magnetic circuit. Thus, with a.c. excitation, the rope may be passed through the magnetic system at as low a speed as may be desired. A further advantage of a.c. excitation is that a thermionic valve type of voltmeter may be used, and the effects of the induced e.m.f. amplified to any extent.

An ink recording instrument is arranged to be operated by the induced e.m.f. in the search-coil system, and in this way permanent records of tests on a rope are obtained so that the development of any incipient flaw may be carefully watched.

In the next section of the paper the flux-penetration in a wire rope for excitations of different frequencies is discussed. In the case of a locked-coil rope, it is important to realise that when the flux has penetrated through the locked-coil sheaths it will be practically uniformly distributed throughout the remainder of the cross-section, since the wires are so effectively stranded. In this respect the effect of screening on the flux distribution is quite different from the case of a solid material.

Tests on samples of locked-coil rope supplied by different manufacturers were made. In the original paper the results are shown in diagrammatic form.

The general conclusion to be drawn from the test results is that, for a.c. excitation at frequencies not greater than 20 cycles per sec., the flux is practically uniformly distributed throughout the whole cross-section of the rope, if the peak value of the flux density is not less than about 16 000 lines per cm^2. A serious objection to the use of a.c. excitation at frequencies as high as 50 cycles per sec., is the large iron losses that are produced in the rope at the high densities.

It has long been known that the magnetic permeability of an iron wire depends on the mechanical stress to which it is subjected, but apparently no results of experiments of wire magnetised by a.c. excitation have yet been published. It was therefore considered desirable to study this effect, which is illustrated in the original paper by curves showing the relationship between flux density and the peak value of the excitation ampere-turns with the rope stressed to a varying extent.

One important result is that, for high values of the excitation, the effect of mechanical stress on the permeability is only small. When testing wire ropes it is therefore important to use high values of the saturation, so that the disturbing effects of internal stresses become relatively unimportant. Such disturbances may be still further limited by adopting a method based on the comparison of two sections of the ropes which are not far apart.

In the next section of the paper the author discusses the effects of eccentricity of the rope in the tunnelled holes through which it passes, and he then proceeds with a general description of the principle of the electromagnetic rope tester.

This consists of a laminated iron yoke having machined tunnelled holes in the projecting limbs, and the wire rope is arranged coaxially with the tunnelled holes. An exciting coil is so wound on the yoke that it is symmetrically placed with respect to the two limbs.

One method of working which gives good results is to use two search-coils, balanced against each other. Then there will be no resultant induced e.m.f. in the search-coil system when a sound piece of the rope is passed through the gap, but immediately a faulty portion of the rope enters the magnet yoke a resultant e.m.f. will be developed. This null method enables a very small change in the flux to be detected.

In order to detect the induced e.m.f. in the search-coil system due to a mechanical flaw in the section of the rope it is desirable to use a type of voltmeter which requires a very small current to operate it, because in this way reactance and reaction effects which would be caused by the voltmeter current in the search-coil system will be eliminated. A resistance for the search-coil system of about 1 000 Ω has been found to give good results. Details of actual tests on a wire rope are given in the final section of the paper.

From the data presented in the original paper it is evident that, whilst a flaw of about 3% of the total section is detectable, a flaw of about 5% produces a pronounced effect, whilst a flaw of about 18% gives a very striking disturbance of the record.

The Users' View Point.

It may be stated that, from the practical point of view of the actual user of a winding rope, any mechanical flaw of less than about 10% is preferably not shown on the record of a rope test, since small flaws do not produce any serious mechanical weakness of the rope likely to endanger its safety, and it is only when about 10% of the section fails that a watch need be kept on the faulty section to see whether it develops further.

A complete rope-testing equipment, built in accordance with the principles explained in this paper, has been installed in the Hatfield Main Colliery near Doncaster. The diameter of the locked-coil winding rope which it is used to test is $2\frac{1}{8}$ in., and the pit shaft is 860 yd. deep.

* Abstract of a paper presented to the Institution of Electrical Engineers.

NEW ALLOYS.

Composition of Loading Material for a Projected Transatlantic Telephone Cable.

THE new continuously-loaded submarine telephone cable projected by the American Telephone and Telegraph Co. for the transatlantic service will employ as loading material one of a new series of alloys which are designated as "perminvars." These are composed of nickel, cobalt, and iron, to which may be added small amounts of non-magnetic metals such as molybdenum. They are characterised by high resistivity and by having a constant permeability over a wide range of magnetising force.

The conductor will be insulated with a new material, "paragutta." Submarine cables in the past have been insulated with gutta-percha or closely related materials, and in a few cases with rubber compounds. Paragutta makes use of similar raw materials, but so combined and treated as to give superior electrical properties with mechanical properties similar to gutta-percha.

THE ELECTRIC HOMES CAMPAIGN.

Preliminary Details of Arrangements for Big Domestic Electrification Drive—A Proposed Home Wiring Specification.

READERS will have gathered from a letter in our correspondence columns last week some idea of the scope of the E.D.A. Electric Homes Campaign, the first section of which will operate from October, 1929, to June, 1930.

The objects of the campaign are :—

(1) To encourage the demand for, and the provision of, adequate wiring in the homes of Britain.

(2) To combat the idea that the installation of electric wiring is expensive.

(3) To show that the cost of using electricity for purposes other than lighting is small compared with many other household expenses.

(4) To encourage complete domestic electrification.

Investigations that have been made show that the majority of houses in this country, and even those being built to-day, are without means for using electricity for purposes other than lighting; and it is within the knowledge of many in the electrical industry that the selling and use of electrical domestic appliances is much retarded because suitable plugs are not always available.

An example of what is happening in many parts of the country is to be seen in a good class residential district not far from London, where a large number of three and four bedroom detached houses are being built, sold and occupied as fast as they are finished. These excellent houses are complete with modern conveniences in the way of sanitation, heating and electric lighting, but without a single plug provided anywhere in the house for the convenient use of electricity for other purposes.

Efforts have already been made by the E.D.A. to combat this state of affairs. In the Wiring the Homes of Britain Campaign, and later in the E.D.A. Circle Campaign, it was found possible to secure the interest of the public by means of demonstration houses in which adequate wiring, amongst other things, was shown.

Following these campaigns, the Electrical Association for Women, at the suggestion of the E.D.A., undertook an "Outlet" Campaign which has been carried on with such force as their resources in personnel and finance have permitted.

The interest of many architects, builders, supply engineers, contractors, etc., who have attended the E.A.W. meetings has been aroused; much, however, remains to be done in this direction. The ultimate idea of the E.A.W. was to establish the Women's National Specification (which they have published) as a guide for those who desire to provide adequate wiring in their houses for the convenient use of electricity.

An essential part of the Campaign will take the form of an E.D.A. Electric Home Wiring Specification which will be recommended to the public. The specification will be designed for the instruction of the public, including architects and builders, and to bring about a larger use of standard material, improve the standard of wiring, and to increase the number of points wired in each house.

Advice on Wiring.

A further advantage of the E.D.A. Electric Homes Campaign will be to give the man in the street reliable information as to how his house should be wired—of which at present he is generally ignorant—and to tell him where to apply for advice.

With increased facilities for using electricity in the home, the consumption of electricity will undoubtedly increase, so that the campaign will be of advantage to supply undertakings, as well as to manufacturers, wholesalers and contractors.

A somewhat similar campaign in Canada and the U.S.A., known as the Red Seal Campaign, has created a definite increase in the number of points on consumers' premises. In the "League News," issued by the Society for Electrical Development, dated January, 1929, figures are given for several principal cities in the U.S.A. which show an average increase of 65% in the number of points per installation, an increase in current consumption of more than 100%, and 43% greater value of electrical merchandise in Red Seal homes, as compared with others.

These figures should serve to inspire all sections of the electrical industry in Great Britain, and particularly individual undertakings and firms, to support the campaign wholeheartedly.

The E.D.A. Council is of opinion that the objects of the campaign will be greatly assisted by the adoption of suitable tariffs, and extension of assisted wiring schemes and increased facilities for the easy purchase of installations and appliances.

The proposed E.D.A. Home Wiring Specification will cover the number and size of all plugs, switches, etc.; in the installation. It will not be a complete technical specification, but will deal chiefly with the installation lay-out.

Every campaign must appeal essentially to the ultimate user of the product advertised—in this case the householder. When he is convinced that the use of electricity for purposes other than lighting is desirable and is economically advantageous to him, he will create a demand which will eventually have to be satisfied by builders and others providing for his needs. The campaign will, however, endeavour to hasten matters by directing publicity towards the builder and others, who are concerned with supplying houses.

Lines of Appeal.

The appeal to the public will be designed principally to show :

(1) The necessity for making provision for electric lighting in every home.

(2) The advantages of using electricity for purposes other than lighting.

(3) The necessity for providing adequate wiring for complete electric service in the home.

(4) The increased value of a house after such adequate wiring has been installed.

To the builders and housing authorities the Campaign will endeavour to show :

(i) That the public require their houses to be adequately and safely wired.

(ii) That the propaganda which will be directed towards the public in this Campaign will have the effect of creating a demand for such houses, and

(iii) That the E.D.A. propose to use every effort to circulate information concerning houses which are adequately wired for complete electric service in the home.

It is submitted that if builders can be convinced that there is a real public demand for E.D.A. Electric Homes they will provide them. Further, in view of the increased competition, any additional selling argument will be welcomed by them.

To the landlord the Campaign will endeavour to show that it is to the landlord's advantage to wire his property, as there is a demand for adequately wired houses, and that, even on property which is subject to the Rent Restrictions Act increased rents sufficient to pay a return on the additional outlay can easily be obtained.

In order to encourage architects to design houses on the lines of the E.D.A. recommendations, efforts will be made to convince them of the value of the electrified home. Those architects who attended E.A.W. meetings on this subject expressed themselves generally anxious to design such houses. The architect is often willing to receive advice and guidance concerning electrical installations in small houses. At the present time his usual plan is simply to allow in his quantities a sum, often totally inadequate, for wiring; the E.D.A. Specification should improve matters in this direction. Efforts will also be made to interest house agents and building societies.

A booklet, with illustrations and diagrams, is being prepared for issue to the public. The booklet will show in a forceful manner the reasons why the complete wiring of a house should be undertaken. This booklet, and the Association's advertisements, will invite the general public to apply for the E.D.A. Electric Home Wiring Specification.

The first draft of the E.D.A. Electric Home Wiring Specification has been prepared by the Campaign Committee and submitted to the following Associations and Committees for their consideration :—The Electrical Association for Women; the Electrical Contractors' Association, Inc.; the Cable Makers' Association; the Accessories Section of the British Electrical and Allied Manufacturers' Association; the Electric Lamp Manufacturers' Association of Great Britain, Ltd.; the Incorporated Municipal Electrical Association; the Conference of Chief Officials of London Electric Supply Companies; the Incorporated Association of Electric Power Companies; the Provincial Electrical Supply Association; the Electric Light Fittings Association; the Heating and Cooking Section of the B.E.A.M.A.; the Electrical Wholesalers' Federation; the Electrical Merchants and Manufacturers' Association; and

Digitized by Google

E.D.A. Provincial Area Sub-Committees. It is hoped to secure the approval and adoption of the Specification at a meeting of the E.D.A. Council in November, and to circulate it immediately thereafter.

The principal item of general propaganda for "local" distribution during the first period of the Campaign will be the E.D.A. Electric Home Booklet. Specimen copies, with list of prices for varying quantities, will be circulated to everyone on the Association's mailing lists. In E.D.A. press advertisements the public will be invited to apply for copies of the book at electric showrooms or shops, or direct from the Association.

In those places where E.D.A. Circles have been established it may, in addition, be found practicable for Circles to co-operate in circulating the book direct to householders. Where this course is not possible, and in all other places, the Association appeals for the wholehearted support of individual supply undertakings and contractors, so as to ensure the widest possible circulation for the booklet.

Area Conferences, at which the organisation and operation of the Campaign will be explained in detail and discussed, will be held during September in the following centres:—Glasgow, Edinburgh, Newcastle, Manchester, Leeds, Birmingham, Cardiff, Bristol, London.

It is desired that the ordinary meetings of all E.D.A. Circles in October should take the form of open conferences to discuss the Campaign. At these conferences Circle representatives who have attended E.D.A. Area Conferences will present a report; wherever possible arrangements will be made for the Area Officer, or another member of the E.D.A. staff, to attend Circle Conferences.

During the months of October and November it is also desired that joint conferences should be organised between E.D.A. Area Committees or E.D.A. Circles and the local branches of the Electrical Association for Women, with a view to ensuring the closest possible co-operation in connection with the supplementary local activities.

The interest of the public in, and value to the industry of, exhibition houses has been amply demonstrated during the last two or three years. It is desirable, for the success of the Campaign, to secure a large number of demonstration houses, wired in accordance with the E.D.A. Electric Home Wiring Specification, or modified demonstrations in showrooms or small halls. Such demoostrations provide the very best means for educating householders, architects, builders, landlords and estate agents.

The Association will provide notes for two special lectures:—No. 1, for the general public; No. 2, for architects, builders, landlords and estate agents. Circles are desired to secure voluntary lecturers and to obtain immediately as many opportunities as possible for meeting organised groups of people, e.g., ratepayers' associations, tenant and property owner associations, rotary clubs, and any local political, social, religious, or commercial organisations in the respective districts.

Copies of the Electric Home booklet and the E.D.A. Electric Home Wiring Specification will be supplied free for distribution to members of sales staffs. The Association considers it of the greatest importance that every electrical salesman and saleswoman should be thoroughly conversant with the E.D.A. recommendations.

Illustrations of window displays, specially designed to emphasise the importance of adequate wiring, will from time to time be issued with instructions in the association's monthly publicity and selling programmes.

During the whole period of the Campaign the Association will support local activities with advertisements in the national Press directed generally towards the public, and, through special channels, to people purchasing or changing houses. A regular series of advertisements will also be inserted in architectural and building journals.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

"Where *is* that Battery?"

[To the Editor.]

Sir,—I am glad to be considered a friend of "Cynicus," but he begs the question of the battery by turning to the vehicle itself. The judgment of the motor car buying public has little or nothing to do with the fundamental fallacy of the "stink wagon." The public did not want an over-engined, over-speeded vehicle, but for the past 30 years they have had to have it because engineering genius has so far not given them a slower and quieter and lower-powered machine. The petrol vehicle of to-day is really an electric vehicle with a reciprocating engine, a fact which is greatly to be deplored by all electrical men who have abandoned reciprocating engines in their power houses.

I challenge "Cynicus" to prove his statement that maximum safe speed and twenty-four hours' running are essential and fundamental in all classes of vehicles. On the score of speed, who wants it? Lower the average speed of traffic in any town by 10 m.p.h., and all vehicles will "get there" just as quickly. Twenty-four hours' running! Who wants it, especially among commercial vehicle users? May I remind "Cynicus" that motoring to-day (except on long open runs) is merely "blinding and braking," a fact that will remain a reproach to engineers as long as there is a "stink wagon" left on the roads.

Meantime "Cynicus" contributes nothing to that great question of the battery. He by-passes my statement that the battery makers are too rich and too busy to trouble about improving a product which has stood still for twenty years. I intended to infer that, due to the war and the purely adventitious arrival of "radio," they are now reaping the fruits of many barren pre-war years. What will they do with those profits. Are their shareholders merely to benefit, or is there to be a pool formed from which research on the question of an improved battery can be financed?

While admitting that every commercial undertaking must pay its way, the engineering industry has always prided itself upon putting development before mere profit. For that reason every engineering product is always undergoing changes for the better, and those improvements are usually financed out of profits.

The battery industry is daily becoming stronger. Only last week you announced an important fusion between two long established and reputable battery manufacturers. Further, it is cheering in every way to read in the advertisements of another battery firm that they are the "largest battery manufacturers in the British Empire." Rumour is "swift footed and many tongued," and now she is busy in the battery world. Splendid! Battery makers, the whole electrical industry wants to hear from you. You are technically the most backward section of a mighty army of engineers. From the Cinderella of electrical engineering you are changing to the beautiful princess, and soon you will have money to burn, if you have not already got it.

It seems incredible that you are all sitting on the fence while the Irish Free State invests a paltry £5 000 in order to prove that your giant has feet of what?—lead!

Your weighted footsteps are holding back important developments in the industry, especially in the field of road and rail traction.—I am, etc.,

"Battery Electric."

September 9th.

POINTS OF VIEW.

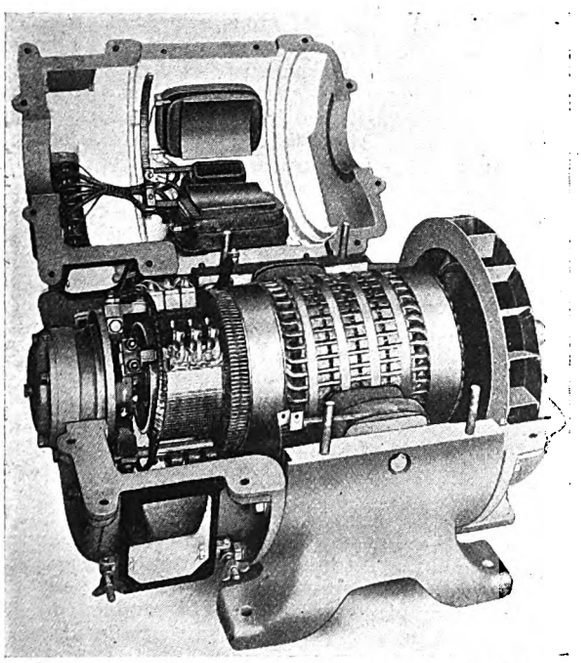
SHIPPING, ENGINEERING AND MACHINERY EXHIBITION.

A Brief Review of Some of the Outstanding Items of Electrical Interest—Many New Equipments for Marine Use.

AMONG the varied exhibits at the Shipping, Engineering and Machinery Exhibition, which opened at Olympia, London, yesterday, are many shown by electrical firms. These items include wireless equipment, lighting plants, motors for a number of purposes, electric winches, etc.

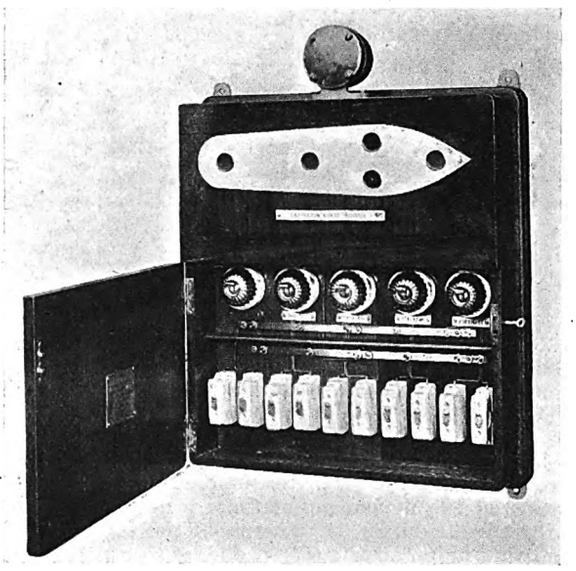
It will be appreciated that to describe the whole of the electrical side of the exhibition would occupy too great a space, and as a compromise, therefore, and in order that readers may form some opinion of the show, we have selected a number of representative items for treatment.

The exhibits of the METROPOLITAN VICKERS ELECTRICAL CO., LTD., of Trafford Park, Manchester, are, for instance, chiefly devoted to marine interests, and include a 7½ kW ship's lighting set. This set comprises a single-cylinder engine, direct coupled to a single pedestal bearing generator. The engine, of the enclosed pattern, is designed for a normal working steam pressure of 120 lb. per sq. in., but is capable of operating on pressures up to 200 lb. per sq. in. The generator is designed to give 7½ kW at 110 V and 550 r.p.m., and is of drip-proof construction, having a sheet steel canopy at both ends of the yoke to protect the windings and commutator. The windings are specially insulated and impregnated to resist a moist saline atmosphere, metallic surfaces are suitably protected against corrosion, and all parts are specially treated to withstand vibration. Another exhibit is a 5 H.P. T.E. vertical pump motor, rated at 1 200 r.p.m. with speed regulation by shunt control to 1 800 r.p.m., with a temperature rise not exceeding 40 deg. C. This motor is capable of working on a varying voltage such as would occur when supplied from a battery, at the same time giving the full speed range within specified voltage limits. A special location bearing is housed in the top bracket to take the weight of the armature and to absorb a pump thrust up to 800 lb. The motor is fitted with a combined bracket and foot for attachment to the pump seating. A standard 10 H.P. vertical marine type pump motor, designed for high speed centrifugal pump drives is also shown. The motor is suitable for a 220 V circuit and is rated



A 50 H.P. ventilated type marine motor by the Metropolitan-Vickers Electrical Co., Ltd.

for 10 H.P. at 1 200 r.p.m. with speed variation up to 1 600 r.p.m by shunt field control. The motors are provided with a few series turns which enables them to start up against considerable overloads. The generator control panel exhibited is a standard panel and is designed for use in conjunction with a 7½ kW generator. It is built of bevelled ebony syndanyo, mounted on a strong angle iron frame, which can be made suitable for either deck or bulkhead mounting. The instruments are of robust design and are sufficiently dead beat to have their readings unaffected by the rolling and pitching of the ship. A 2-stage steam-operated air ejector, with tubular inter-cooler and heater embodied in one casing, is another item, and this is suitable for maintaining a vacuum of 28½ in. Hg in a condenser for a 4 000 B.H.P. turbine. The steam consumption would be approximately 275 lb. per hour. Another



The navigation lights indicator shown by Siemens Brothers & Co., Ltd.

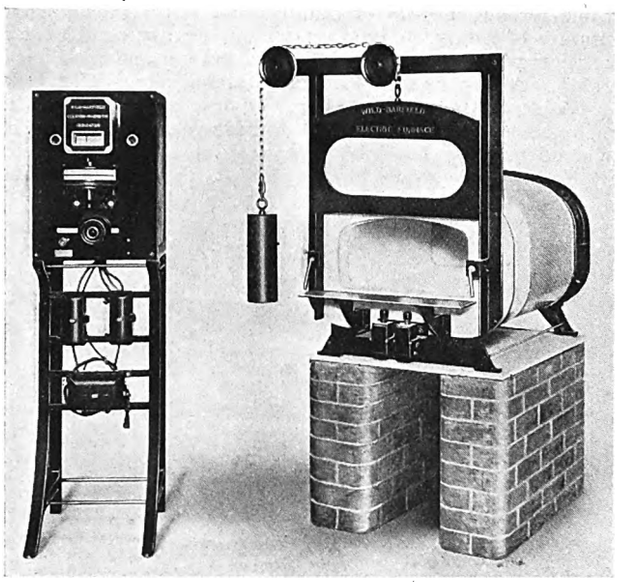
exhibit is a vertical 3 in. centrifugal condensate extraction pump arranged for direct drive from the slow speed shaft of the speed reduction gear of a turbine up to 7 000 B.H.P. The pump speed is 1 500 r.p.m. A 1½ H.P. motor, suitable for oil separator drives, is exhibited, and gives an example of a small "Metro-Vick" marine type motor.

The 11 H.P. totally enclosed ventilated motor shown on the stand has an output of 11 H.P. at 780 r.p.m. 220 V. and is rated at 6 hours—40 deg. C. The field coils and the armature iron are cooled by two separate air streams. Cooling is effected by air passing through the armature iron, and, it is pointed out, as the losses generated in this portion of the machine form a considerable portion of the total losses of a totally enclosed machine, this method of cooling results in a very great reduction in the size and weight over a standard totally enclosed machine. No external air comes into contact with the windings or commutator, and it is claimed that the machine will operate satisfactorily either in an explosive or highly corrosive atmosphere.

SIEMENS BROTHERS AND CO., LTD., of Woolwich, London, S.E., also show equipment of marine interest, including ships' electric telegraphs. This apparatus takes the place of the usual mechanically-operated gear for communicating from the bridge to the engine room, and also for docking and steering. It is independent of the ship's power mains, being operated by means of primary batteries and directly connected without the use of switches, so that the circuits cannot be accidentally left open. Telephones for navigational purposes are also shown, and it is pointed out that the problem of an efficient system for the purpose of communicating from the bridge to the engine room, poop, etc., resolves itself into the provision of an instrument which enables a conversation to be carried on notwithstanding the noise of the engine or the force of the wind. Siemens telephones, it is claimed, enable a conversation to be carried on under these conditions. The electric helm indicator shown is operated directly by the movements of the rudder, and, therefore, indicates the actual angle of the rudder or helm, and not the movements of the telemotor of other control gear. The movements of the rudder are indicated positively in steps of 2½ deg. up to 10 deg. on each side of amidships and for the remainder o

Digitized by Google

the motion in 5 deg. steps. The instrument is actuated by its own battery (one cell) and is, therefore, independent of the ship's mains. The " Rotary " type ahead and astern revolution indicator exhibited has been designed primarily to indicate when the engines start and stop, but it also enables the revolutions per minute of the shaft to be ascertained. The



A horizontal furnace, type 16 F, with an output of nearly 3½ tons of steel per working week of 47 hours. The exhibit is that of Wild Barfield Electric Furnaces Ltd.

wide short pointer moves one-tenth revolution of the dial for each revolution of the propeller shaft, giving a very distinct indication of the movement of the engines.

The wireless exhibits include two of the company's i.c.w. transmitting units, sizes 200/300 and 400/500. These have been designed to take the place of the ½ and 1½ kW spark transmitters respectively. Both transmitters employ the balanced valve circuit. The auxiliary short wave transmitter included on the stand employs a 500-W oscillating valve and is suitable for use on vessels which wish to maintain communication during a period each day from any part of the world with the mother country. A most interesting feature is the extremely accurate transmitting condenser by means of which the transmitter can be returned at once to any desired wavelength within the short wave band. Other wireless items include a short range telephone transmitter suitable for use on board coastal vessels, survey vessels, etc., and a 1½ kW quenched spark installation.

Among the auxiliary apparatus on view is the Siemens auto alarm device, and a single rotating frame direction finder.

The temperature measuring apparatus shown comprises electrical distance thermometers, which are suitable for temperatures from 200 deg. C. to 500 deg. C., thermo-electrical pyrometers suitable for temperatures from about 300 deg. C. up to 1 400 deg. C., and optical pyrometers for temperatures from 700 deg. C. to 2 500 deg. C.

Visitors to the exhibition should make a special point of calling at THE ELECTRICIAN stand in Section L Gallery, No. 1, where every assistance will be given in dealing with inquiries, etc. Apart from its obvious use as a rendezvous for electrical men, anyone seeking a brief rest from the general exhibition will be welcome.

ALLOY WELDING PROCESSES, LTD., Ferry Lane Works, Forest Road, London, E.17, have on view ten different types of welding equipment, including the latest " A.W.P." design of motor generator set, which will appeal to all those who desire a machine of pleasing appearance, light weight, small dimensions and competitive in price. In addition to the machines there are the usual wide range of electrodes now known as the " A.W.P." brand, which embraces varieties to suit all classes of work including stainless steel, staybrite steel, high speed steel, manganese steel, copper, bronze, and brass. Demonstrations are given daily in the use of these electrodes and include the welding of the various acid and heat resisting proprietary steels now on the market.

BULL MOTORS, LTD., Ipswich, show a portable arc welding set of a new type. It is called the " Bull Midget " portable arc welding plant, and is notable for compactness of design and for the fact that the control gear is completely enclosed in a steel cubicle, the instruments being of the ironclad flush type. The welding generator is controlled by shunt and series field regulators, and welding can be satisfactorily carried out over a range of 25/100 A. A standard 200 A portable arc welding set provided with d.c. motor, and complete with all control gear, is also shown. Both these sets are in operation under welding conditions, and the flexibility of operation and stability at the lower welding currents demonstrated. Another exhibit is a " Bull " weatherproof motor in operation under conditions which demonstrate the suitability of this motor for use in exposed outdoor positions. A small pump is coupled to the motor, and directs upon the latter a continuous shower of water. Explosion proof motors especially designed for use in fiery mines, oil pumping installations, and other inflammable atmospheres, are shown. These are of both a.c. and d.c. types, and the explosion proof construction is covered by the certificate of the Mining Department, Sheffield University. A high tension d.c. motor-generator set, examples of other special machines, and exhibits showing the construction of standard d.c. and a.c. motors are also featured.

BLACKSTONE AND CO., LTD., Stamford, show examples of cold starting heavy-fuel-oil engines, " unchokeable " pumps, and petrol-electric sets. Two horizontal heavy-fuel-oil engines are featured, one a 55 B.H.P. single cylinder unit, and the other a 64 B.H.P. twin direct-coupled to a 230 V " Bull " generator. Both engines are fitted with " spring injection." The 1½ kW petrol-electric set shown is driven by a " Blackstone " petrol engine with overhead valves and automatically governed throttle which controls both quantity and quality of the mixture passing to the combustion chamber. The set is accurately balanced, easily started, effectively silenced, and a partial vacuum, permanently maintained in the crankcase, prevents the escape of oil at the bearings and makes the set clean running. There are also two Blackstone " unchokeable " pumps on this stand, representing the range of sizes up to 16 in. inlet, made by this firm. A 3 in. belt-driven set is shown at work, which is capable of dealing with liquids carrying in suspension solids up to 2⅝ in. in diameter, and is seen pumping solid spheres of this size. Another 3 in. " unchokeable " pump is shown direct-coupled to a 5 B.H.P. Blackstone " no-trouble " petrol engine, the complete unit being mounted on a trolley, making a portable set suitable for emptying dykes, trenches, cesspools, gullies, tanks, foundations, etc.

WINGROVE AND ROGERS, LTD., Arundel Chambers, Strand, London, W.C.2, show one of the latest designs in electric vehicles. This has a capacity of 2 tons, a speed of 5 m.p.h., and a radius of action of 15/20 miles per charge. The battery is carried in a steel compartment, suspended centrally beneath the chassis. This compartment is mounted on a series of coil springs in order to protect the battery from shock when the truck is being loaded. It consists of 20 cells, 168 A h capacity, of D.P. Kathanode manufacture, or, 20 cells, 161 A h capacity, Exide-Ironclad manufacture, arranged in hard wood boxes, and provided with iron lifting straps. The motor is of the totally-enclosed series wound traction type with steel yoke. The poles are built of annealed sheet steel punchings, assembled under pressure and secured to the yoke by tap bolts. Four poles are used. The fields are former wound of d.c.c. wire vacuum impregnated to resist oil and moisture, and the coils are protected from the yoke and from their respective poles by fullerboard sheaths. The armature core is built of sheet steel stampings, assembled under pressure between end plates, the punchings being keyed directly to the shafts. The armature winding consists of former wound coils of d.c.c. wire or ribbon. The formed coils are taped all over and impregnated.

Armature and Commutator Details.

Armature slots are lined with treated fullerboard, and when completely wound a second impregnation is given to the entire armature. The commutator is built of hard drawn copper bars of ample wearing depth, assembled on a cast iron hub pressed on and keyed to the shaft, insulated with selected mica and undercut. The brushes are of carbon with flexible copper tails moulded in. The brush holders are of the box type. The controller is of the reversible drum type to suit the series wound motor with double wound field coils. Three speeds forward and three reverse are provided. In first speed the fields are in series with the resistance in. In second the fields are in series with the resistance out. In third the fields are in parallel, resistance out. The greatest pulling power is obtained in third speed. The drum consists of a square steel shaft on which is moulded a micanite covering 1/16 in. thick. The segments are cast iron fitted to the drum-

Digitized by Google

shaft, and carry renewable strip copper contacts secured by means of screws, the heads of which are on the inner side of the segments. The provision of suitable gearing keeps the angle of movement of the control lever within convenient limits, and definite positions are provided for each speed. All cables are brought to a common terminal board, located beneath the front section of the platform, which facilitates the removal of the motor when required. Cables from the terminal board to the controller are carried inside the hollow dashboard out of danger from accidental damage and yet easily accessible.

The exhibits of the ELECTRO-MECHANICAL BRAKE CO., LTD., 86, Strand, London, W.C.2, include (1) electric winches and ship's winches, embodying double opposed worms, thus eliminating the necessity of using ball thrusts; (2) a.c. and d.c. pillar type starters for both industrial and ship uses; (3) steel case controllers, for industrial purposes; (4) explosion proof air break drum type controller, for use in fiery mines, gas works, and on board all ships; (5) unbreakable jointless and rustless grid type resistance, for use on board ship and general industrial purposes; and (6) steel case cam type star delta and rotor starters.

PETTERS, LTD., Westland Works, Yeovil, are showing among other plants a 1½ kW electric generating set, which consists of a Petter 3 B.H.P. paraffin or petrol engine (magneto-ignition type) direct-coupled to an electric generator carried on a cast iron baseplate. The engine is specially built for the purpose, being fitted with highly sensitive governor and heavy single disc flywheel. The engine is of the two-stroke cycle type and when supplied for running on paraffin is started by means of a small quantity of petrol. After running for a few moments the engine changes over automatically and runs on paraffin. High tension magneto is fitted. The dynamo is of the two bearing type. Another set is a 3 kW generating plant, consisting of a 5 B.H.P. surface ignition, cold starting oil engine, direct-coupled to an electric generator, the speed being 725 r.p.m. The engine is governed by means of a centrifugal governor which operates by controlling the amount of fuel injected. The engine starts from cold, and the set is recommended for use as a standby or emergency plant. An 8 kW generating set of a similar type to the 3 kW set, but with a 12 B.H.P. engine running at 525 r.p.m., is also shown.

Stoking Equipment.

EDWARD BENNIS AND CO., LTD., 28, Victoria Street, London, S.W.1, are exhibiting working models of:—(1) A new natural draught coking stoker on a single flue Davey Paxman economic boiler; (2) a new type of air draught stoker as applied to a marine boiler; (3) a forced draught chain grate of the new carrier bar type with multiple air control; and (4) a coal pulverising plant on the "Simplex" unit system.

WILD BARFIELD ELECTRIC FURNACES, LTD., Elecfurn Works, Harrow Road, London, N.7, have made arrangements with the Matchless Motor Cycles (Colliers), Ltd., of Plumstead, and with the De Lavaud Free-Wheel Differential, Ltd., of Letchworth, to send men from their works, and to divert the production from their factories to Olympia each day to be heat treated in "Wild-Barfield" electro-magnetic furnaces, similar to those in their own works. The furnaces used in these operations are standard works types, but it will be noticed from the photograph that the control panels are now self-container floor units, the controls, with the exception of the magnetic indicator, being behind the panels. Those interested in carburising, annealing, etc., in large furnaces can also see a furnace fitted with automatic temperature control in operation. The consumption of this furnace is 20 kW, and the heaters are specially prepared nickel chromium elements totally enclosed in the bricks constituting the chamber. A new electrically heated die casting machine is also on view.

This machine is mounted on a cast stand, which brings it to a convenient height for the operator. The actual heating chamber is 8 in. diameter and 11½ in. deep, in which the pump mechanism, consisting of a container and cylinder machined out of cast iron, is accommodated. The maximum current consumption is 2 kW, and the equipment may include either a rheostat for hand control or a regulator for automatic control. Electrically heated high speed steel hardening furnaces are also shown in operation, together with oil and air tempering ovens with automatic control, electric solder bolt heaters, and laboratory muffles. A "Vickers Pyramid" hardness testing machine, manufactured by Vickers-Armstrongs, Ltd., of Erith, for whom the company are distributors, is shown in operation, and samples brought by interested visitors can be tested on the stand.

The exhibits of the PREMIER ELECTRIC WELDING CO., LTD., Abbey Wood, London, S.E.2, include a large number of mechanical and semi-mechanical devices for producing rapid welding by means of coated electrodes. Included in this range is the "Flexin" hand welding tool, and the "Flexin" flexible electrode. In this system the flexible electrode, fully fluxed and wound on a special drum, is fed to the arc by means of a pneumatic or electrically driven hand tool. Another exhibit is the "Belfinish" electrode, which claims results much in advance of those obtained by other processes. The value of this electrode will be illustrated by welded samples of various types. Included on the stand is a full range of "Premier" electrodes. Examples of "Prescot" resistance welding machines manufactured by BRITISH INSULATED CABLES, LTD., are shown at work welding all classes of steel and iron and some non-ferrous metals.

Signalling and Measuring Instruments.

EVERSHED AND VIGNOLES, LTD., Acton Lane Works, Chiswick, London, W.4, are exhibiting a number of the marine signalling instruments which have been supplied to the Admiralty and to the Merchant Marine, including the electrically operated helm indicator, link, and valve indicator, the "Pulsator" speed indicator, and the latest form of electrical tachometer. One of the most interesting exhibits is a working model of the Brewerton Course Recorder, an apparatus which repeats to scale on a chart the movements of a ship. A full display is given of the electrical testing instruments made under the name of "Megger," including the "Megger" and "Bridge-Megger" testing sets, "Meg" insulation tester, workshop ohmmeters, and ducter low resistance testing sets. In addition, there is shown for the first time the new "Bridge-Meg" resistance tester, described in THE ELECTRICIAN last week. The "Megger" earth tester is also shown in operation on a model of a sub-station with transmission line. A number of the "Evershed" chart recording instruments having straight time lines are exhibited in operation, including watt-meters, power-factor meters, and frequency meters. In addition, an operation recorder is shown working. A traction recorder, similar to that supplied to many of the leading railways and tramway services, both at home and abroad, is also demonstrated. Another item is the "Midworth" distant repeater. The purpose of this system is to repeat at a distance the movement of instruments or apparatus, and it is also used for the actual distant control of distant machinery.

DAVEY, PAXMAN AND CO., LTD., of Colchester, are exhibiting one of their four-cylinder vertical cold starting oil engines designed for marine auxiliary work, capable of developing 250 H.P. continuously, with overloads of an hour's duration up to 290 H.P. The design embodies the Blackstone patent "spring injection" system of fuel injection. The Paxman patent eccentric operated exhaust valve gear is also incorporated. The engine shown is totally enclosed and provided with forced lubrication throughout; the camshaft is sheathed, and the governor, which is instantaneous, is driven direct from the crankshaft and is continuously lubricated from the main oil system.

200kW Auxiliary Plant.

RUSTON AND HORNSBY, LTD., of Lincoln, are exhibiting a 200 kW marine auxiliary generating plant. The engine is a five-cylinder unit running on the Ruston airless injection principle, capable of power production continuously over long periods with heavy loads on low-grade fuel oils.

NORRIS, HENTY AND GARDNERS, LTD., of Barton Hall Engine Works, Patricroft, Manchester, are exhibiting a number of heavy oil engines, both of vertical and horizontal type, together with an electric lighting set, a small air compressor set, and a double acting water pumping set for deck and general use.

The YORKSHIRE COPPER TUBE WORKS, LTD., of Leeds, are showing copper tubes in all sizes from 0·005 in. to 24 in. diameter as supplied to the British Admiralty and foreign navies, home, foreign and colonial railways, marine engineers, consulting engineers, coppersmiths, etc., and condenser tubes in all standard and special alloys.

The exhibits of R. A. LISTER AND CO., LTD., Dursley, Gloucestershire, include small lighting plants for yachts, country houses and so on, while the SUNDERLAND FORGE AND ENGINEERING CO., LTD., of Pallion, Sunderland, are exhibiting a marine electric equipment, including a worm-geared silent deck winch, a contactor type control gear panel, open type single pedestal bearing generators, 110 V ships' lighting sets, a six-way marine type switchboard, a patent unistart switchboard, and a vibratory screen for grading coal, coke, or cement.

(To be continued).

NEWS IN BRIEF.

Forthcoming Exhibitions—Electric Bridge over the Tees—E.P.E.A. Southern Section Dinner—Blackpool Illuminations—Prospectuses of Technical Schools.

GRIMSBY Corporation recently invited tenders for the construction of a sub-station building at Holton-le-Clay.

The first electrically illuminated tennis court in Australia was opened seven years ago, and the number of such courts is now estimated to be between 2 000 and 3 000.

Applications are invited for stands at an exhibition of electrical appliances to be held at Milford Haven from October 2nd to 4th, inclusive. Further particulars from the Resident Engineer, Council Offices, Milford Haven.

An improvement scheme, to be carried out at Boston (Lincs) Docks, includes the erection of a coal hoist, electrically-driven pumps, etc., estimated to cost £16 000.

Wireless exhibitions are to take place at Fribourg from September 7th to 15th, at Lyons from September 21st to 29th, and at Paris from September 27th to October 13th.

The Exhibition of Inventions will be held at the Central Hall, Westminster, from October 2nd to 12th, inclusive. The Institute of Patentees, 39, Victoria Street, London, S.W.1, will supply further details.

The Business Efficiency Exhibition will take place in the Free Trade Hall, Manchester, from September 18th to 28th, inclusive. Further particulars can be obtained from Mr. A. C. McLellan, 37 and 38, Strand, London, W.C.2.

It is announced that the Ministry of Transport is to bear 75% of the cost of the proposed bridge over the river Tees at Newport. The type of bridge contemplated is one of the vertical lift type, the centre span being raised by electric power to facilitate the passing of traffic on the river. The total cost of the scheme is estimated at £60 000, and a Bill in Parliament to authorise it will be promoted by Middlesbrough Corporation and the county councils concerned.

LOOKING BACKWARD

FIFTY years ago, according to THE ELECTRICIAN *dated September 13th, 1879,*

Although there were no commercial telephone exchanges, the use of telephonic communication was extending gradually. A proposal to establish a Manchester Telephonic Exchange was receiving wide support.

An electric railway 300 metres long was in operation at the Berlin Industrial Exhibition.

* * *

TWENTY-FIVE years ago THE ELECTRICIAN *dated September 16th, 1904, stated that :*

Station engineers were warned that after the long spell of hot and dry weather, thorough tests of the insulation of mains networks was desirable.

When Southwark Council discussed the desirability of advertising for a chief electrical engineer, an Alderman said that "any person of ordinary intelligence could read up in a month all that an electrical engineer knew. It was all a lot of theory. What they wanted was a good mechanic to supervise the station."

* * *

FIFTEEN years ago, it was stated in THE ELECTRICIAN *dated September 11th, 1914, that :*

The Institutions of Civil, Electrical and Mechanical Engineers were considering the formation of an infantry battalion for Kitchener's Army.

* * *

TEN years ago, THE ELECTRICIAN *for September 12th, 1919, reported that :*

The price of copper (best selected) had fallen to £109 per ton.

The Joint Industrial Council for the Electric Cable Making Industry held its first meeting.

A telegraph picture service between Sydney and Melbourne was inaugurated on Monday. The ordinary telegraph lines are used, and the pictures may be handed in at any post office for delivery in the same way as telegrams.

Automatic telephones have now been installed at the White House, Washington. The President's number has, therefore, been changed for the first time in 29 years, and for the third time since 1878, when the telephone was first installed.

Imports into the Irish Free State during July, 1929, included electrical goods valued at £35 539, compared with £33 038 in July, 1928. The aggregate value of the same classes of goods imported during the seven months ended July, 1929, was £347 256, against £246 711 in the corresponding period of 1928.

A booklet has been issued giving particulars of the evening classes in electrical engineering at the Northampton Polytechnic Institute, St. John Street, London, E.C.1. It contains a list of the teaching staff, and details of the subjects covered by the courses, requirements for admission, examinations, certificates awarded, degrees and scholarships obtainable, syllabuses of the classes, the equipment of the electrical laboratories, etc. Enrolment will take place on each evening (except Saturday) of the week commencing September 16th, and classes will commence on September 23rd. Prospectuses can be obtained from the Principal.

At the E.D.A. display at the North-East Coast Exhibition film displays were given on 965 occasions, attendance nearly 38 000, while 31 displays were given to schools, with an attendance of 1 100.

The eleventh annual dinner of the Electrical Power Engineers' Association, Southern Division, will take place at the Hotel Cecil, London, on October 19th. Tickets (7s. 6d.) from the hon. secretary of the Division, Mr. P. Gordon Hieatt, 25, Parkhurst Road, Bowes Park, London, N.22.

The National (London) automatic telephone exchange, serving the Aldersgate and Wood Street areas, the north of Newgate Street and Cheapside, was put into service on September 7th.

Amongst the most interesting exhibits at the Exhibition of Model Engineering, which was opened at the Royal Horticultural Hall, London, on September 7th, is an electrically operated working model of the Lord Mayor's Show of 1616, by Mr. John B. Thorpe. The Show is said to be historically correct, and it takes five minutes to pass along a stage which has Old Cheapside as a background.

The first section of the Blackpool autumn illuminations was inaugurated on August 6th, when 12 000 electric lamps were switched on at the open air baths. The scheme has been executed under the superintendence of Mr. C. Furness, borough electrical engineer, and Mr. F. W. Field, resident engineer. The illuminations will be continued every night, and on September 21st, when effect will be given to the full scheme, about 100 000 lamps will be in use. At the open air baths there are eight flashing kaleidoscopes, the dome above the entrance hall and all the main buildings are outlined in light, and an illuminated yacht rides at anchor in the centre of the lake.

At last week's meeting of Salford City Council, at which the recommendation to accept the tender of Nederlandsche Kabelfabriek, Delft, Holland, for the supply of cables, amounting to £8 428, was adopted, it was stated that the saving as compared with the lowest satisfactory English offer was approximately 14%.

The eighth National Exposition of Power and Mechanical Engineering will be held at New York from December 2nd to 7th next. The exhibits will include the latest mechanical equipment for fuel combustion, power generation, distribution, transmission and utilisation, heating and ventilating equipment, refrigeration and material handling plant. There will be over 500 exhibitors. British participation is welcomed by the organisers, the International Exposition Co., Grand Central Palace, New York.

The Polytechnic School of Engineering (Regent Street, London) has just issued a prospectus of its wireless and high frequency engineering courses for the session 1929–30. These courses extend over five years, and provide a thorough training in the principles and technique of the subject. The prospectus gives particulars as to fees, the times and days of the various classes, and the principles dealt with therein. Enrolments will take place from September 16th to 20th, and Mr. W. H. Date, head of the wireless and high frequency section, will supply any further details.

Digitized by Google

BUSINESS ITEMS.

MESSRS. CITY WIRELESS SUPPLIES, 49, New Briggate, Leeds, is now under the sole control of Mr. F. Fricker.

MESSRS. SIEMENS AND HALSKE have secured a contract for the erection of new telephone exchanges at Hankow, commencing with 8 500 telephones.

We understand that J. HENDERSON AND CO., LTD., are supplying eight electrically operated aerial cableways to Sir John Jackson (Singapore), Ltd.

MESSRS. S. R. WHYTE, electrical contractors, of 458, London Road, West Croydon, are renovating and extending their premises and opening up a large new showroom.

At the Annual Exhibition held at Bristol last week, the ELECTRIC HOMES CO., of 71, Park Street, gave special study to exhibits of lighting fittings and shades. A wide range of electrical domestic appliances was also shown,

The TELEGRAPH CONDENSER CO., LTD., announces that, as Messrs. Green and Jackson, of Birmingham, have dissolved partnership, Mr. P. H. Jackson, trading as P. H. Jackson and Co., has now taken over the sole agency for T.C.C. condensers in the Midland territory.

Col. R. E. CROMPTON announces that he has entered into partnership with Dr. ALFRED EKSTROM, who has specialised in the problems of applying electrical energy to agriculture in Sweden. The partnership will act as consultants on similar matters in the United Kingdom and in our Colonies.

B.T.H. magnetos were fitted to the machines in which Flying Officer H. R. D. Waghorn and Flying Officer R. L. D. Atcherley made their record-breaking flights in the Schneider Trophy race.

BELL'S ASBESTOS AND ENGINEERING SUPPLIES, LTD., Asbestos House, Southwark Street, London, S.E.1, have issued special literature regarding the removal of their chief offices to the new works at Slough. It is expected that the new London offices and warehouse at 157, Queen Victoria Street, and 239, Upper Thames Street, will be ready for occupation this month, meanwhile arrangements have been made for the counter trade to be carried on at the old Southwark address as above.

We are informed that Messrs. PETO AND RADFORD and the HART ACCUMULATOR CO., LTD., have as from September 9th, joined forces under the name of the NATIONAL ACCUMULATOR CO., LTD. The National Company offers the two makes of battery—Hart, and Peto and Radford, forming, together, a very extensive range. Sales will shortly be conducted by the company from 93, Great Portland Street, at which address offices and showrooms have been taken and specimens of the products of both companies will be on view. An arresting window display will be maintained, and a full battery service given.

We are advised by WINGROVE AND ROGERS, LTD., Arundel Chambers, Strand, London, W.C.2, that seven standard "Victor" electric vehicle chassis, fitted with van bodies to the Postmaster-General's specification, were recently delivered to the Mount Pleasant Post Office, London, where we understand they are in regular use for parcels delivery work. This purchase is in the nature of an experiment, which Messrs. Wingrove and Rogers feel confident will prove successful, as the work involves a limited daily mileage, for which duty this vehicle is expressly designed. The vans themselves, however, are long past the experimental stage, and a large number have been sold in various parts of the country for similar delivery work. It is understood that a demonstration van will shortly be available at the above address.

H.M. Consul-General at Bushire has forwarded to the Department of Overseas Trade information which he has received from Captain C. G. Prior, political agent, Bahrein, relating to a launch built in Kuwait and provided with a 60–65 H.P. Kelvin engine, which he has seen at Bahrein. He says the launch was lit by electricity, but the generating set, without battery, was of American origin. He would be glad to be put into touch with makers of such generating sets in England, so that he may recommend their use in launches. The installation of electric light in Bahrein is going to give rise to a large market for electrical accessories, lamp fittings, small apparatus driven by electricity, etc., and he would like to have particulars of firms dealing in such articles, with catalogues, so that he may introduce them to appropriate firms, etc. Copies of catalogues may be sent to H.M. Consul-General, British Consulate-General, Bushire, for transmission to Captain Prior, but the Comptroller-General of the Department of Overseas Trade would like to be informed of any such action. (Reference B. 5622.)

PERSONAL.

MR. T. Johnston has been appointed manager of Drake and Gorham (Wholesale) Ltd. (Dublin branch). He was formerly assistant manager.

Mr. C. G. Seeley, manager of the Australian General Electric Co., Ltd., has been elected a member of the American Electro-Chemical Society.

Sir Edward Manville (a partner in the firm of Kincaid, Waller, Manville and Dawson) has been elected Master of the Coachmakers' Company.

Mr. R. W. Whitley has been appointed as London manager of J. H. Tucker and Co., Ltd., and took up his duties on Monday at 101, Dean Street, W.1.

We understand that Mr. H. J. Farrell is now directing the Irish business of Ferranti, Ltd., from new headquarters at Corn Exchange Buildings, Burgh Quay, Dublin.

Councillor John Walsh, a well-known electrical engineer, will be re-nominated as Conservative candidate for St. Mark's Ward, Blackburn, in the forthcoming municipal elections.

Mr. H. McDonald has resigned the management of the Dublin branch of Drake and Gorham (Wholesale) Ltd., in order to take charge of the Irish organisation of Philips Lamps, Ltd.

Mr. E. G. Hitch, son of Mr. W. E. Hitch, retired sectional engineer of the Post Office, has been appointed electrical mechanician, Posts and Telegraphs Department, Kenya Colony, East Africa.

Mr. F. Buckley has been appointed, in succession to the late Mr. C. J. Jewell, as a representative of the Norwich Electric Tramways Co. on the National Joint Industrial Council for the Tramway Industry.

Mr. William Birtwistle, a millionaire and septuagenarian, and Miss Edith Stevenson, are to be married in London. Miss Stevenson is 21 years of age, and recently resigned a position at Siemens' Lamp Works.

The Earl of Birkenhead, chairman of the Greater London and Counties Trust, Ltd., sailed on the "Olympic" this week on a business trip to America in connection with his various business interests there. He will be away four or five weeks.

Mr. P. H. Warren, a member of the staff of the erection department of the Metropolitan-Vickers Electrical Co., is, according to the "Metropolitan-Vickers Club News," the first man to have used the England to India air service for a business journey.

Sir Sassoon Jacob David, lately chairman of the Bombay Electric Supply and Tramways Co., Ltd., who died on September 27th, 1926, left personal estate in England of the net value of £4 242 18s., in addition to property in India of the net value of 1 607 500 rupees, exclusive of trust property valued at over 20 000 000 rupees.

The marriage was solemnised at St. Peter's Church, Rugby, on September 3rd, of Mr. Alfred Ferdinand Fowler, formerly of the staff of the British Thomson-Houston Co., Ltd., and now with the West Midlands Joint Electricity Authority, at Wolverhampton, and Miss L. E. Hill, of Rugby. Mr. Fowler received a clock from his colleagues at Wolverhampton.

Mr. F. F. Elliott, station engineer of Woolwich (London), Borough Council's electricity department, who had been selected by Torquay Electricity Committee for appointment as borough electrical engineer and manager at Torquay at a commencing salary of £1 000 per annum, has withdrawn his application, and, at a meeting on September 3rd, the Corporation authorised the Committee to appoint one of the other applicants.

The Lord President of the Department of Scientific and Industrial Research has appointed Lord Rayleigh, F.R.S., Sir Arthur Balfour, Sir William H. Bragg, F.R.S., and Sir James Walker, F.R.S., to be members of the Advisory Council to the Committee of the Privy Council, the following members having retired on completion of their terms of office: Sir H. C. Harold Carpenter, F.R.S., Dr. G. C. Clayton, Sir Richard T. Glazebrook, F.R.S., and Sir James H. Jeans.

Obituary.

MR. JOHN HALLAM, partner in the firm of J. E. Hallam and Sons, general electrical engineers, of 30, Great Portland Street, Stockport.

ALDERMAN GEORGE NEW, on September 4th, aged 66 years. He had been a member of Sunderland Town Council for 32 years and served as chairman of the Tramways Committee.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, where available.

KINGSWOOD (SURREY) PAROCHIAL COUNCIL.—Electric light installation in Parish Church. Particulars from the churchwarden, Mr. W. S. Lloyd, Spencer House, Tadworth.

DUNDEE EDUCATION AUTHORITY, September 13th.—Electric lighting work in connection with erection of new Primary School at Rockwell, Lawton Road, Dundee. Specifications, etc., from Messrs. Allan and Friskin, 26, Castle Street, Dundee.

LEYTON CORPORATION, September 13th.—Electric light installation at Canterbury Road Schools. Particulars from the architect, Mr. John H. Jacques, 61, West Ham Lane, Stratford, London, E.; deposit £1.

WORKSOP GUARDIANS, September 13th.—Re-wiring Kilton Hill Infirmary. Specifications from Mr. J. Haslam, Ryton Chambers, Bridge Street, Worksop.

Travelling Cranes.

BELFAST CORPORATION, September 16th.—Overhead travelling cranes, for the electricity department. Specification (W. 95), etc., from Mr. F. H. Whysall, city electrical engineer and manager, East Bridge Street, Belfast; deposit £2 2s.

BOLTON GUARDIANS, September 16th.—Six months' supply of electric lamps, etc. Form of tender from the clerk, Mr. H. I. Cooper, 28, Mawdsley Street, Bolton.

EDMONTON GUARDIANS, September 16th.—Six months' supply of electric lamps. Forms of tender from the clerk, Mr. E. Ridley, 77, Bridport Road, Edmonton, London, N.18; stamped addressed envelope to be sent.

MERSEY RAILWAY CO., September 16th–24th.—Supply of electrical sundries (item No. 10); metallic and carbon filament lamps and fittings (No. 13), etc. Forms of tender from Mr. J. Shaw, general manager and secretary, Central Station, Birkenhead. Patterns and samples can be seen on September 16th and 17th at the place shown on the tender forms. Tenders by September 24th.

WIGAN GUARDIANS, September 16th.—Supply of electrical engineering sundries for six months. Tender forms from the Matron of the Institution, Frog Lane, and the Steward, Billinge Infirmary, Orrell.

LINLITHGOW DISTRICT COMMITTEE, September 17th.—Supply and fixing of electric lamps, brackets and fittings in Winchurch Special Lighting District, and/or in Kirkliston Special Lighting District. Specifications from Mr. J. G. B. Henderson, District Clerk, Linlithgow, or Mr. G. A. Maclennan, Middleton Hall, Uphall.

HOLBORN (LONDON) GUARDIANS, September 18th.—Six months' supply of electrical fittings. Forms of tender from the Clerk, 53, Clerkenwell Road, E.C.1; stamped, addressed envelope to be sent.

ROCHDALE CORPORATION, September 18th.—Supply of a.c., single phase, ordinary house service and prepayment type meters for 12 months. Specifications from Mr. F. H. Rudd, engineer and manager, Electricity Works, Dane Street, Rochdale.

DEVON MENTAL HOSPITAL, EXMINSTER, September 20th.—Six months' supply of electric lamps, etc. Tender forms from the clerk, Mr. Cecil Masters.

NORTHERN IRELAND MINISTRY OF FINANCE, September 20th.—Electric light installation at the Custom House, Londonderry. Specifications can be seen and forms of tender obtained at the Custom House, Londonderry, and at the offices of the Ministry, 15, Donegall Square West, Belfast.

WARRINGTON GUARDIANS, September 21st.—Twelve months' electrical supplies to Whitecross Institution, Warrington, or Cottage Homes, Padgate. Tenders (separate for the two places), to Mr. Arthur Bottomley, clerk, Union Offices, Museum Street, Warrington.

SALFORD CORPORATION, September 23rd.—Supply of 10 000 kVA, 33 kV/6·6 kV transformers for outdoor service. Specification from the City Electrical Engineer.

COMMISSIONERS OF H.M. WORKS, ETC., September 24th.—Steam generating set, control panel and modification of existing electric generator, at the State Institution, Rampton, Retford. Specification, etc., from the Contracts Branch, H.M. Office of Works, King Charles Street, London, S.W.1; deposit £1 1s.

DEVIZES RURAL DISTRICT COUNCIL, September 25th.—Electric light installation in houses at Easterton, Great Cheverell, Market Lavington, West Lavington, and Worton. Particulars from the clerk, Mr. P. R. Trapp, Maryport Chambers, Devizes.

STAFFORD COUNTY EDUCATION AUTHORITY, September 26th.—Electric light and power installation in new wing of Wolverhampton Grammar School. Specification, etc., from Messrs. Moffett, Rosher and Mann, Union Chambers, Temple Row, Birmingham; deposit £3 3s.

EAST LOTHIAN EDUCATION AUTHORITY, September 27th.—Electrical work in connection with erection of public schools at Longniddry and Aberlady. Forms of tender, etc., from Messrs. Morham and Brotchie, 29, Hanover Street, Edinburgh.

HORSHAM URBAN DISTRICT COUNCIL, September 27th.—Supply and erection of (*a*) rotary convertor 125 kW step-up transformer, two draw-out truck type e.h.t. switch units; (*b*) sub-station equipment: two 100 kVA transformers, e.h.t. switchgear, l.t. switchboard and cable works; (*c*) one e.h.t. feeder cable, laid complete. Specification with form of tender, drawings, etc., from the electrical engineer, Mr. F. Ffrench, Electricity Works, Horsham, depositing £3 3s. (or £1 1s. for any one section).

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, September 27th.—Supply and erection of a double circuit, 33 000 V, three-phase, 50 cycle, overhead (steel towers) transmission line. Specification (No. 33/T/1), from Mr. E. F. Hetherington, chief engineer and manager, at the offices of the Authority, Phœnix Buildings, Dudley Road, Wolverhampton; deposit £1 1s.

MIDLOTHIAN AND PEEBLES DISTRICT ASYLUM, ROSSLYNLEE, September 28th.—Six months' supply of electrical fittings, etc. Forms of tender from the clerk and treasurer, Mr. C. L. Addison Smith, 19, Heriot Row, Edinburgh.

METROPOLITAN ASYLUMS BOARD, October 2nd.—Installation of electric bells at Paddington Casual Ward (Contract No. 6): new storage battery for t.s. "Exmouth" (No. 7); and alterations to electric lighting in "X" block at Eastern Fever Hospital (No. 8). Specifications from the Board's Office, Victoria Embankment, E.C.4; deposit £1 for each.

HALIFAX CORPORATION, October 7th.—Electricians' work in connection with erection of filter house, etc., for the waterworks department. Specifications, etc., on and after September 16th, from the Borough Engineer; deposit £2 2s.

HACKNEY (LONDON) BOROUGH COUNCIL, October 9th.—One 30 000 kW C.M.R. turbo-alternator and exciter, etc. Specifications from the Borough Electrical Engineer, 18–24, Lower Clapton Road, E.5; deposit £30.

HACKNEY (LONDON) BOROUGH COUNCIL, October 9th.—Fourteen 6 600 V, three-phase, metal clad, oil circuit breaker equipments, each not less than 1 000 000 V rupturing capacity; remote electrically-controlled, duplicate busbars; cabling and auxiliary gear controlling one 30 000 kW turbo-alternator, two 30 000 kVA transformers, two 15 000 kW reactance links, one 30 000 kVA busbar coupler equipment, with and without reactance, and six 8 000 kW feeders. Specifications from the Borough Electrical Engineer, 18–24, Lower Clapton Road, E.5; deposit £3.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52) 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

AUCKLAND (N.Z.) ELECTRIC POWER BOARD, September 16th.—Supply of automatic sub-station at Remuera (two 500 kW machines and switchgear); automatic sub-station at Point Chevalier (two 1 000 kW machines and switchgear); 22 000 V switchgear; 6 600 V switchgear; and supervisory control apparatus. (Reference B.X. 5 506.)

INDIA STORE DEPARTMENT, September 17th.—Supply of 119 tons of g.i. wire. Schedule (No. 3) (5s.) from the Director-General, Belvedere Road, London, S.E.1.

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, September 17th.—Supply and erection of petrol-electric sets. (Reference B.X. 5 537.)

Digitized by Google

ANDERLECHT MUNICIPALITY, September 18th.—Supply of three-phase static transformers. Cahier des charges from La Régie de l'Electricité, 6, Rue Van Lint, Anderlecht; fr. 3.

BELGIAN POSTES AND TELEGRAPHS, September 18th.—Miscellaneous telephone apparatus and accessories. Cahier des charges special, No. 3 431, from the Posts and Telegraphs Dept., La Salle Madeleine, Brussels; fr. 6.

LAOIGHIS COUNTY COUNCIL, September 18th.—Electrical installation at the County Court, Portaoighise. Specifications from the County Surveyor, Court House, Portaoighise.

VICTORIAN RAILWAYS COMMISSION, September 18th.—Electric lamps, for Victorian Railways (contract No. 43 141). (Reference B.X. 5 619.)

IRISH FREE STATE COMMISSIONERS OF PUBLIC WORKS, September 20th.—Two electric lifts at the Stationery Office (Beggar's Bush Barracks), Dublin. Specification from the Office of Public Works, Dublin; deposit £1.

SOUTH INDIAN RAILWAY CO., LTD., September 20th.—Supply of electric goods, locomotives and battery tenders, in connection with electrification of Madras suburban services. Specifications, etc. (£1) from the Company's offices, 91, Petty France, Westminster, S.W.1.

SOUTH INDIAN RAILWAY CO., LTD., September 20th.—Electrical control and traction equipment for suburban services. Specifications, etc. (£1, not returnable), from the Company's Offices, 91, Petty France, Westminster, S.W.1.

AUCKLAND ELECTRIC POWER BOARD, September 23rd.—Supply of pilot cable and joint boxes. (Reference B.X. 5 643.)

EGYPTIAN MINISTRY OF THE INTERIOR, September 23rd.—Electric light installation and distribution system for the town of Kafr-el-Cheikh (Gharbieh Province). Reference B.X. 5 502.)

INVERCARGILL (N.Z.) CORPORATION, September 23rd.—Supply and delivery of switchboard, to be directly operated and suitable for controlling 11 000 V, three-phase, 50-cycle current. It may be either of the draw-out truck type or totally armour clad, and will at first consist of seven units. (Reference B.X. 5 507.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, September 23rd.—Crude oil engine-driven 150 kW electric generating plant. (Tender No. 1 528.) (Reference B.X. 5 566.)

INDIA STORE DEPARTMENT, September 24th.—Supply of 31 000 yards of dry core electric cable. Schedule (No. 4) (5s.) from the Director-General, Belvedere Road, London, S.E.1.

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, September 24th.—Supply of condensers (schedule C. 461.) (Reference B.X. 5 488.)

INDIA STORE DEPARTMENT, September 25th.—Supply of 200 000 porcelain and composition telegraph insulators. Schedule (No. 3) and form of tender (5s.) from the Director-General, Belvedere Road, London, S.E.1.

Electrical Plant for South Africa.

SOUTH AFRICAN RAILWAYS AND HARBOURS, September 26th.—Two 100 kVA motor-alternators (tender No. 1 521). (Reference B.X. 5 564.)

DURBAN CORPORATION, September 27th.—Supply of three-phase ironclad, compound filled switch panels (specification S. 778). (Reference B.X. 5 505.)

SOUTH INDIAN RAILWAY CO., LTD., September 27th.—Convertor equipment for sub-stations, transformer switchgear and accessories, overhead transmission line, etc., in connection with electrification of suburban services. Specifications (£1) from the Company's Offices, 91, Petty France, Westminster, S.W.1.

EGYPTIAN MINISTRY OF THE INTERIOR, September 28th.—Supply and erection of electric power station for the town of Samannoud (Gharbieh Province). (Reference B.X. 5 596.)

EGYPTIAN MINISTRY OF THE INTERIOR, September 28th.—Machine tools, Diesel and semi-Diesel engines, boilers, electric batteries, etc., for the Prisons Administration. (Reference A.X. 8 245.)

MARLBOROUGH (N.Z.) ELECTRIC POWER BOARD, September 28th.—Supply and erection of 600 B.H.P. Diesel-driven generating plant and switchgear. (Reference B.X. 5 556.)

COMPANHIA DOS CAMINHOS DE FERRO PORTUGUESES, September 30th (extension of time).—Signalling apparatus. (Reference A. 8 427.)

EGYPTIAN MINISTRY OF THE INTERIOR, September 30th.—Supply and erection of electric power station, with overhead and underground networks, for the town of Deirout. (Reference B.X. 5 598.)

STATE ELECTRICITY COMMISSION, VICTORIA, September 30th.—Supply and delivery of three 3 000 kVA 50 cycle, oil immersed, self-cooled, outdoor type single-phase transformers and spare coils and bushings. (Reference B.X. 5 523.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, September 30th.—Twelve months' supply of electric lamps (tender No. 1 526). (Reference B.X. 5 590.)

VICTORIAN ELECTRICITY COMMISSION, September 30th.—Three 3 000 kVA transformers and spares. (Reference B.X. 5 523.)

SOME of the competitors, after the three-legged race at the Enfield Cable Works' sports on September 7th. The winners were Mr. R. Kiddle and Miss D. Turner (second and third from left). Mr. J. R. Baker, hon. secretary of the Sports Committee, is on the right with his partner, Miss R. Ainge. *See page* 313.

VICTORIAN ELECTRICITY COMMISSION, September 30th.—Supply, erection and maintenance of coal conveying plant. Specification (No. 29/68) from the Agent-General for Victoria, Victoria House, Strand, London, W.C.; returnable deposit £2 2s.

WELLINGTON CORPORATION, September 30th.—Electric motors, starters and switchgear, for the Milk Department. (Reference B.X. 5 508.)

EGYPTIAN MINISTRY OF THE INTERIOR, October 1st.—Erection and equipment of electric power station (about 500 kVA), with overhead and underground networks, for the town of Menouf. (Reference B.X. 5 567.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, October 1st.—Supply of electric lamp standards. (Reference A.X. 8 251.)

POSTS AND TELEGRAPHS DEPARTMENT, MELBOURNE, October 1st.—Supply and delivery of switchboard cords. (Reference B.X. 5 515.)

NEW ZEALAND POSTS AND TELEGRAPHS, October 1st.—Supply of bolts, brackets, screws, springs, etc., for British Post Office No. 121 wall telephones and No. 2 receiver switch. (Tender No. P. and T., 151/1 700.)

EGYPTIAN MINISTRY OF THE INTERIOR, October 2nd.—Supply and erection of electric power station for Dessouk Town (Gharbieh Province). (Reference B.X. 5 597.)

SYDNEY CITY COUNCIL, October 2nd.—Supply of 6 600 V metal-clad switchgear for Argyle sub-station (specification No. 858; 2s. 6d.); 2 200 V ironclad switchgear for Town Hall sub-station (No. 856; 2s. 6d.); and 1 500 V switchgear for Argyle sub-station (No. 857; 2s. 6d.). Specifications can be obtained from the Chief Engineer, 61, Hunter Street, Sydney, N.S.W.

VICTORIAN RAILWAY COMMISSION, October 2nd.—Supply of a.c. line relays for power signalling. (Reference B.X. 5 563.)

SOUTH AFRICAN POLICE, October 3rd.—Supply of electric torches, etc. (local indent No. 50.) (Reference C.X. 3 118.)

BULAWAYO MUNICIPALITY, October 4th (extension of time).—High tension overhead lines, with appurtenant gear and step-down transformers; pumps and motors with starters, etc. (contract No. 6/29). (Reference A. 8 462.)

SOUTH INDIAN RAILWAY CO., LTD., October 4th.—Supply of converter equipment for sub-stations (specification No. 6); transformer switchgear and accessories (No. 7); and overhead transmission line (No. 8). Specifications, etc., from the company's offices, 91, Petty France, Westminster, S.W.1. A charge of £1 (not returnable) will be made for each specification

Digitized by Google

MONTEVIDEO PORT ADMINISTRATION, October 7th.—Electric trucks, for load of 1 500 to 2 000 kilos, with generating sets for charging batteries, etc. (Reference A.X. 8 353.)

VICTORIAN ELECTRICITY COMMISSION, October 7th.—Supply and delivery of 11 000 V three-core cable. (Reference B.X. 5 539.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, October 8th.—Electric ranges, radiators and water heaters, for Waitaki power scheme (section 38). (Reference B.X. 5 642.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, October 8th.—Telephone relays (schedule C. 478). (Reference B.X. 5 655.)

ANTWERP MUNICIPALITY, October 10th.—Supply of 32 portal type electric travelling cranes (cahier des charge No. 800). (Reference A.X. 8 447.)

EGYPTIAN MINISTRY OF THE INTERIOR, October 10th.—Supply and erection of electric generating station for Tala. (Reference B.X. 5 647.)

SOUTH INDIAN RAILWAY CO., LTD., October 11th.—Overhead contact and distribution lines, in connection with electrification of Madras suburban services. Specifications (10s.) from the company's offices, 91, Petty France, Westminster, S.W.1.

NEW ZEALAND POSTS AND TELEGRAPHS, October 15th.—Condensers (P. and T. 151/1 733.) (Reference B.X. 5 602.)

NEW ZEALAND POSTS AND TELEGRAPHS, October 15th.—Supply of B.P.O. type resistances. (No. P. and T., 151/1 712.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, October 15th.—Seven 5 500 kVA single-phase auto-transformers, with accessories, for Waitaki power scheme. (Reference B.X. 5 417.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, October 15th.—Switchboard instruments, test plugs and sleeves (schedule C. 472). (Reference B.X. 5 541.)

WELLINGTON POSTS AND TELEGRAPHS DEPARTMENT, October 15th.—Supply and delivery of B.P.O. type resistances. (Reference B.X. 5 551.)

WELLINGTON POSTS AND TELEGRAPHS DEPARTMENT, October 15th.—Supply and delivery of B.P.O. type retardation coils. (Reference B.X. 5 552.)

CAPE TOWN MUNICIPALITY, October 16th.—Supply of paper insulated cables (specification No. 474). (Reference B.X. 5 640.)

EGYPTIAN MINISTRY OF THE INTERIOR, October 16th.—Electric motors, pumps, filters, and artesian well. (Reference A.X. 8 373.)

NEW ZEALAND POSTS AND TELEGRAPHS, October 16th.—Automatic wall and table telephones. (Reference B.X. 5 509.)

NEW ZEALAND POSTS AND TELEGRAPHS, October 16th.—Automatic telephone dials (P. and T. 151/1 734.) (Reference 5 605.)

JOHANNESBURG MUNICIPALITY, October 17th.—Tramcar motors (contract No. 253). (Reference B.X. 5 664.)

SALISBURY (S. RHODESIA) MUNICIPALITY, October 17th.—Turbo-alternators, steam piping, crane and switchgear (contract 52.) (Reference B.X. 5 607.)

SALISBURY (S. RHODESIA) MUNICIPALITY, October 17th.—Supply of h.t. cables, transformers and sundries, in connection with extensions of the electricity undertaking (contract 53). (Reference B.X. 5 604.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, October 17th.—One 10-ton electric overhead travelling crane (tender No. 1 533). (Reference A.X. 8 463.)

H.T. and L.T. Switchgear.

WELLINGTON CORPORATION, October 21st.—High and low tension switchgear (contract No. 449). (Reference B.X. 5 649.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, October 22nd.—Supply of insulated wire (schedule C. 475). (Reference B.X. 5 580.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, October 22nd.—Telephone transformers (schedule C. 474). (Reference B.X. 5 581.)

VICTORIAN RAILWAY COMMISSION, October 23rd.—Dry-core telephone cable (contract No. 43 384). (Reference B.X. 5 638.)

MELBOURNE CITY COUNCIL, October 30th.—Two 2 500 kW motor-converters and accessories, or two 2 500 kW rotary converters, with transformers and accessories. (Reference B.X. 5 570.)

NEW ZEALAND POSTS AND TELEGRAPHS, October 30th.—Head receivers (P. and T. 151/1 725). (Reference B.X. 5 603.)

ARGENTINE STATE RAILWAYS, November 4th.—Turbo-generator sets, and headlights for locomotives. (Reference B.X. 5 657).

AUCKLAND ELECTRIC POWER BOARD, November 4th.—Low tension porcelain insulators, etc. (Reference B.X. 5 648.)

VICTORIAN ELECTRICITY COMMISSION, November 4th.—Supply of 6 600 V automatic voltage regulators and spares (specification 29/83). (Reference B.X. 5 637.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, November 12th.—Transmitters and associated parts (schedule C. 476). (Reference B.X. 5 653.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, November 12th.—Receivers and associated parts (schedule C. 477). (Reference B.X. 5 656.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, November 19th.—Supply of telephone generators and motor generators (schedule No. C.479). (Reference B.X. 5 662.)

WESTERN AUSTRALIA GOVERNMENT, November 29th.—Supply and erection at Perth of (*a*) boiler house equipment, and (*b*) 12 500 kW turbo-generator and condensing plant. Specifications (£1 1s. for each; not returnable) from the Agent-General, Savoy House, Strand, London, W.C.2.

VICTORIAN ELECTRICITY COMMISSION, November 25th.—Switchgear, for Yallourn power station (specification No. 29/103). (Reference B.X. 5 636.)

VICTORIAN ELECTRICITY COMMISSION, November 25th.—Watt-hour meters, recording instruments and remote, metering equipment, for Metropolitan terminal stations and sub-stations (specification No. 29/92.) (Reference B.X. 5 614.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, December 10th.—Three single-phase, oil insulated, water-cooled transformers, with accessories (section 295). (Reference B.X. 5 600.)

Tenders Accepted.

ADMIRALTY.—Alloy Welding Processes, Ltd., 12 months' supply of A.W.P. electrodes.

GENERAL POST OFFICE.—Edison Swan Electric Co., Ltd., supply of carbon filament lamps.

SHEFFIELD CORPORATION.—A. Reyrolle and Co., Ltd., supply of 24 e.h.t. switches, £3 950 8s.

GENERAL POST OFFICE.—Edison Swan Electric Co., Ltd., gasfilled and metal filament (vacuum) lamps.

SOUTHERN RAILWAY.—Edison Swan Electric Co., Ltd., drawn wire, gasfilled and carbon filament lamps.

MANCHESTER EDUCATION COMMITTEE.—John Adams, Ltd., electrical installation at Aspinal Municipal School.

KINGSTON AND DISTRICT GENERAL HOSPITAL.—Philips Lamps, Ltd., supply of portable X-ray apparatus, £142.

MANCHESTER CORPORATION.—Hall and Stinson, electrical installation in houses on Moston (Lightbourne Road) Estate.

GLASGOW CORPORATION.—Bruce Peebles and Co., Ltd., supply of six 400 kVA transformers, £169 each. (Recommended.)

WAR OFFICE.—General Electric Co., Ltd., pearl Osram gasfilled and vacuum lamps, clear Osram lamps and Robertson carbon filament lamps.

DUBLIN CITY COMMISSIONERS.—North British Lifting and Moving Appliance Co., Ltd., supply of motors, automatic starters and starting switches.

SALFORD CORPORATION.—Metropolitan-Vickers Electrical Co., Ltd., supply of transformers and underground street pits, £1 342. (Recommended.)

GENERAL POST OFFICE.—General Electric Co., Ltd., telephone exchange equipment for Ashton-on-Ribble, Fulwood and Leyland (Preston multi area).

WATFORD CORPORATION.—General Electric Co., Ltd., truck type h.t. switchgear, for the premises of the Electric Hose and Rubber Co., Ltd., £514 0s. 6d.

HOLYWOOD URBAN DISTRICT COUNCIL.—Johnson and Phillips, Ltd., supply and erection of mains, switchboard, cable, transformers, etc., in connection with electricity supply scheme.

COMMISSIONERS OF H.M. WORKS, ETC.—Metropolitan-Vickers Electrical Co., Ltd., transformers for Natural History Museum, London; Electrical Installations, Ltd., rewiring at Imperial College of Science, London; Belshaw and Co., Ltd., wiring at Broadmoor Asylum.

GLASGOW CORPORATION.—Bennet Furnishing Co., Ltd., 50 sets, and G. D. Peters and Co., Ltd., 100 sets of car seats; British Insulated Cables, Ltd., ⅝ in. insulated bolts; Hart Accumulator Co., Ltd., storage battery for Bearsden substation; Dyer and Young, Ltd., armature coils; Callender's Cable and Construction Co., Ltd., d.c.c. wire.

COIL WINDING.

Machines for Production of Self-supporting Coils of Spool-wind Type.

AT the exhibition to be held from October 16th to 26th, at Leicester, the UNIVERSAL WINDING COMPANY, of Manchester, are exhibiting three of their automatic coil winding machines.

The No. 96 machine to be exhibited features the production of self-supporting coils of the spool-wind type, that is, having the wire turns parallel and laid in a plane at right angles to the axis of the coil. The supporting element is obtained by the interweaving of cotton strands between the wire turns and layers. This not only furnishes the desired binder, but also acts as an insulating agent, especially between the end turns of each layer, at which point the cushion of cotton is increased to the maximum, to take care of the increased potential.

In addition to the standard wire compensating device, the machine is equipped with an electrical stop motion, which will cause the winding spindle to stop instantly should breaks or other interruptions occur in the cotton supply. An attachment for stopping the winding spindle when breaks occur in the wire supply and a counter for recording the number of wire turns are incorporated.

The No. 97 machine has been designed for the production of self-supporting spool-wind coils having paper insulation of high di-electric strength between the wire layers. Equipped with two spindles, the winder produces four coils of like specifications simultaneously, handling wires ranging from No. 29 to No. 44 (B. and S. gauge) in size, and winding coils either round or rectangular in form up to 2 in. in diameter. Each layer of wire is registered by means of an adjustable counter which can be set for any required number of layers up to 100, and when the predetermined point has been reached, the winding spindles are automatically stopped by means of a release.

The No. 102 winding machine has been evolved for the production of telephone receiver and other small spool-wound coils not requiring insulation. The No. 102 is offered in units of three or six spindles, as desired, the spindles being governed by a common traverse, but otherwise operating independently. The winding spindles are equipped with individual measuring devices capable of being set at any predetermined number of layers up to 90. The standard type of machine is equipped to wind 100 turns per layer of wire ranging from No. 38 to No. 44.

THE SOCIAL SIDE.

AT the recent inter-departmental rowing contest, promoted by the Portsmouth Tramways and Electricity Employees' Social and Athletic Society, the lamp boys defeated the mains department in the final. During the preceding three weeks, the lamp boys had won a galley race at Cowes Regatta, and the Visitors Cup and first prize for a galley race at Sandown Regatta.

The first annual sports and gala of the Enfield Cable Works Social and Athletic Club took place at the Enfield Cable Works' own ground at Brimsdown on September 7th. In addition to a long programme of athletic events, there were members' vegetable and flower shows, a Morris and folk dancing display, various side shows, and dancing in the evening to music supplied by the Enfield British Legion Military Band. A further attraction was a grand display of flowers by Messrs. Chaplin Bros., Ltd., of Waltham Cross. There was a large attendance of spectators, amongst those present being Mr. W. Fraser, deputy managing director of the company; his sister, Miss Fraser, who distributed the prizes; Mr. D. A. S. Porteous, works manager; Mr. F. W. Main, chief of the test and research department; Mr. E. C. Pentney, London buyer; and Mr. J. R. Baker, who, as hon. secretary of the Sports Committee, was largely responsible for the success of the meeting. Amongst the winners of the athletic events were: H. Baldock, men's 100 yds, 220 yds., and 440 yds. scratch races; C. Speller, men's mile handicap; R. Mills's team, relay race; L. Jessup, veterans' 100 yds. handicap; A. C. Harvey, men's mile walk (time, 8 min. 58⅘ sec.); F. Vesey, men's long jump (18 ft. 2 in.); W. Warren, men's high jump (5 ft. 2 in.); D. Turner, ladies' half mile walk; D. Cutting, ladies' 80 yds. scratch race; Fire Brigade team, inter-departmental tug-of-war; and Waltham Abbey team, fire brigade competition. During the men's mile walk A. Plumb gave an exhibition performance, covering the mile in 7 min. 20 sec. See page 311.

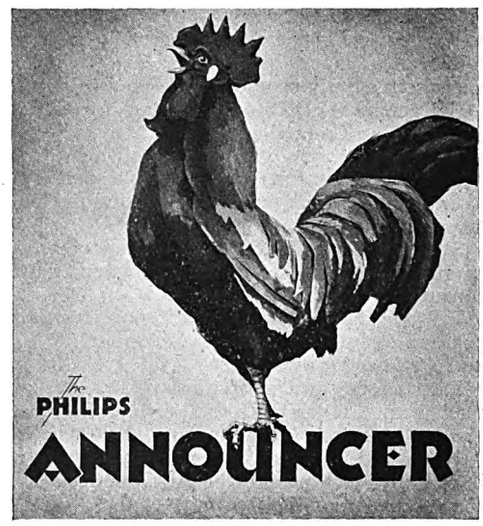
TRADE PUBLICATIONS.

SPECIAL booklets devoted to domestic appliances have been sent to us by the A.E.G. ELECTRIC CO., LTD., of 131, Victoria Street, London, S.W.1.

Vol. 2, No. 2, of the "Nickel Bulletin," published by the MOND NICKEL CO., LTD., Imperial Chemical House, London, S.W.1, has been received.

The September blotter of the JACKSON ELECTRIC STOVE CO., LTD., of 143, Sloane Street, London, S.W.1, illustrates one of the coming season's new fires.

A new publication by MR. ALAN WRIGHT, of 117, Victoria Street, London, S.W.1, is a leaflet dealing with the "Inventum" electrically heated incubator.



The cover of the current issue of the new publication "The Philips Announcer."

Enclosed lighting units manufactured by SIEMENS ELECTRIC LAMPS AND SUPPLIES, LTD., of 38/39, Upper Thames Street, London, E.C.4, are dealt with in catalogue No. 199, superseding No. 156.

The September blotter of POPE'S ELECTRIC LAMP CO., LTD., of Elasta House, 5, Arthur Street, London, W.C.2, has been received. Folder No. 5 145, entitled "the Wizard of Light," is also to hand.

HERBERT MORRIS, LTD., Loughborough, have published a new booklet entitled "A Jib-Crane Revelation"; the reference is No. 833. Folder F. 38, dealing with a new portable electric hoist, has also been issued.

The September issue of the electrical accessories list of BAXTER AND CAUNTER, LTD., 219, Tottenham Court Road, London, W.1, is now available to the trade. The next issue will be published in November.

We have received from S. G. LEACH AND CO., LTD., of 26/30, Artillery Lane, London, E.1, a copy of publication No. N.S. 107, describing a Home Office pattern propellor fan which has just been placed on the market.

The IGRANIC ELECTRIC CO., LTD., 149, Queen Victoria Street, London, E.C. has issued advanced information relative to the new products for the 1929/30 radio season, which will become effective on September 23rd.

New publications from SIEMENS BROTHERS AND CO., LTD., of Woolwich, London, S.E.18, include catalogue 820, section VIII, dealing with junction boxes for pyrometer installations, and catalogue 840, section III, concerning electrical distance thermometers for hotels, theatres, etc.

ASKANIA-WERKE A.-G. have published a special leaflet concerning the Askania sag meter for overhead line construction, a description of which was published in THE ELECTRICIAN of June 28th. Copies of the leaflet are obtainable from Mr. O. G. KARLOWA, Abford House, Victoria, London, S.W.1.

We have received from OERLIKON, LTD., of 28/31, Essex Street, Strand, London, W.C.2, copies of bulletins Nos. 94 to 97. These deal with equipment at the Tammerfors electricity works, e.h.t. circuit breakers, mercury rectifier equipments, and new locomotives supplied to the Swiss Federal Railways, respectively.

The September issue of the "Relay Recorder," the house journal of the Relay Automatic Telephone Co., Marconi House, London, W.C.2, contains its usual quota of good natural and well-expressed sales talk, as examples of which the articles on "Telephone Magic" and "A New Alarum" are gems of their kind. "Round the World to the Relay" is this month devoted to South Africa, in which country a number of important "Relay" installations are already working.

ELECTRICITY SUPPLY.

Extension of Darwen's Public Electric Lighting—Crewe's Hire-Purchase Scheme—Nantwich Council House Lighting—Ballycastle Lighting Scheme—Unemployment Relief Works at Nelson—Bermondsey Mains Extensions.

HULL Electricity Committee has obtained sanction for a loan of £79 000 for extensions.

Manchester Electricity Committee has obtained sanction to borrow £17 200 for extensions for electricity mains.

Boston (Lincs) Corporation has decided to promote an electricity supply scheme, estimated to cost £20 000.

Ballymena U.D.C. is applying for a Special Electricity Order. The Council has decided to take a supply from the Antrim Co.

The Northampton Electric Light and Power Co., Ltd., is to extend electric light mains in London Road and Wellington Street, Northampton.

Stoke-on-Trent Electricity Committee has obtained sanction to borrow £35 920 for mains, plant and cost of changing consumers' apparatus.

Bolton Electricity Committee seeks sanction to borrow £25 000 for sub-stations, transformer kiosks and equipment, and £75 000 for mains.

Darwen Highways Committee has decided that the main road from Anchor to Golden Cup shall be lighted electrically, instead of by gas lamps.

Harraton P.C. has entered into an agreement with the Lambton, Hetton and Joicey Collieries, Ltd. for a supply of electricity for public lighting.

Watford R.D.C. has withdrawn its objection to the proposal of the Central Electricity Board to construct an overhead transmission line from Watford to Luton.

Crewe T.C. has adopted a hire-purchase scheme for electrical apparatus in consumers' houses. Estimates are being prepared for the provision of an electrical showroom.

Plans are to be prepared for the lighting of the whole of Withernsea sea front electrically. Cables are expected to be laid in the town during the present month.

Doncaster T.C. has applied for a loan of £1 200 for an additional transformer station and h.t. feeder cable to meet the demands in the easterly part of Wheatley Hills.

The North Wales Power Co. has informed Nantwich U.D.C. that the company is in a favourable position to extend the supply of electricity to sixty houses which the Council proposes to build.

Ballycastle (co. Antrim) Lighting Committee has met representatives of the Ballycastle Electric Light and Power Co. regarding terms for street lighting and has come to an agreement.

Burnley T.C. has refused a request for compensation for alterations to home wireless sets necessitated by the change over of system and pressure of supply of electricity to houses at Rosehill.

Cheltenham Corporation has given approval to the proposal of the Shropshire, Worcestershire and Staffordshire Electric Power Co. to erect an overhead electric cable through the town planning area.

The Antrim Electricity Supply Co. has offered to supply the town of Coleraine at £5 per kVA, plus 0·6d. per kWh, provided an arrangement is come to by Coleraine, Portrush, Portstewart and Ballymoney.

The North-West Midlands Electricity Authority is opposing the application of the Trent Valley and High Peak Electricity Co. for a Fringe Order under which a transmission line would pass through Abbots Bromley.

Lichfield R.D.C. has consented to an application by the Trent Valley and High Peak Electricity Co., Ltd., for permission to erect an overhead transmission line through Colton, on the route from Rugeley to Abbots Bromley.

Shardlow R.D.C. has decided to be heard by the Ministry of Transport with reference to the proposal of the Leicestershire and Warwickshire Electric Power Co., Ltd., to use an overhead transmission line in the vicinity of Melbourne.

Inverness Electricity Department is granting special terms to the L.M. and S. Railway Co. and other large consumers. The charges for power will be for the first 100 000 kWh 1½d. per kWh; for the next 50 000, 1¼d.; and for all current thereafter 1d. per kWh.

Purfleet U.D.C. has resolved to object to the proposed overhead transmission line in the district of the County of London Electric Supply Co. on the grounds that it will pass over private dwelling houses, the Council's housing estate at Aveley, and that portion of the district which would become the civic centre of the district.

Nelson T.C. has decided to submit schemes for approval by the Unemployment Grants Committee for financial assistance for works, amounting to £55 865 and including renewal of mains, services, etc., in connection with the change-over from d.c. to a.c.—cost, £55 865.

As the outcome of an interview with the Commissioners, Abergavenny Council has decided to obtain terms for a bulk supply from the South Wales Electrical Power Distribution Co., the West Gloucestershire Co. and the Worcestershire and Shropshire Electric Power Co.

A Government inquiry was held at Eastbourne on Wednesday into the proposed scheme for the erection of overhead cables across the Sussex Downs from Brighton to Eastbourne. The opponents of the scheme contend that it would destroy some of the most beautiful spots on the Downs.

The Hampshire Electricity Co. has applied to Droxford R.D.C. for consent to a Special Order to supply electricity in the area. The Council considers that the distributing mains proposed to be laid within a period of two years are insufficient and is not prepared to give its consent unless better facilities are arranged.

It has been reported that 78 of the Torquay Corporation houses on the Westhill estate require re-wiring and that the cost would be £6 19s. 1½d. per house or a total of £542 11s. 9d. The Housing Committee has decided that inquiry be made of the Electricity Committee as to whether it will carry out the work, leaving the payment therefore to be spread over a period of years.

The negotiations between Southport Electricity Committee and the Birkdale District Electric Supply Co. for a revision of the price for electricity supplied in bulk to the Birkdale area have had a satisfactory outcome. As from October 1st, the charge to be made by the Corporation will be £4 per kWh of maximum demand per annum, plus a charge of 0·35d. per kWh.

Lurgan U.D.C. has decided to communicate with the Electricity Commissioners in Belfast and if necessary to send a deputation to the Commissioners to get expert advice on the present capacity of the electricity plant at the generating station in William Street to cope with the supply, and to ascertain whether additional plant or another engine at the works is necessary.

Southend T.C. has received sanction to a loan of £6 645 for the installation of a 1 500 kW motor-generator. An inquiry by the Electricity Commissioners will be held into the application for a loan of £66 000 for the installation of generating plant and accessories, in place of the existing steam generators and Diesel plant. The Commissioners think it advisable that the question of bulk supply should be considered.

Luton Electricity Committee has decided that a discount of 2½% be allowed off the total amount of electricity supply accounts, including meter rents, on the condition that the accounts are paid within fourteen days, and that the existing charge of 2½% for interest on ordinary accounts not paid within one month be discontinued.—The Committee is to extend cables to supply the "Half-Way" estates, Dunstable Road, Caddington.

Kettering U.D.C. has decided to oppose an application by Mr. R. Borlase Matthews for an Order to supply electricity in an area covering 584 square miles, in the counties of Leicester, Rutland, Northampton, and the Soke of Peterborough. The Council also decided to apply for an Order to distribute electricity in an extensive rural area including the parishes of Corby, Cottingham, Great Oakley, Great Weldon, Little Weldon, Stanton, Gretton, Rockingham, Ashley, and Stoke Albany.

Bermondsey (London) Electricity Committee has considered proposals by the Borough Electrical Engineer for the laying of mains in a large number of streets in the borough and installing electricity in the houses in such streets. The estimated cost is £93 247, and application for sanction to borrow £30 000 has already been made to the Commissioners. The Committee has been instructed to inform the Unemployment Grants Committee that it is prepared to submit to the Council a scheme for the carrying out of the works referred to, subject to financial assistance being available from the Government.

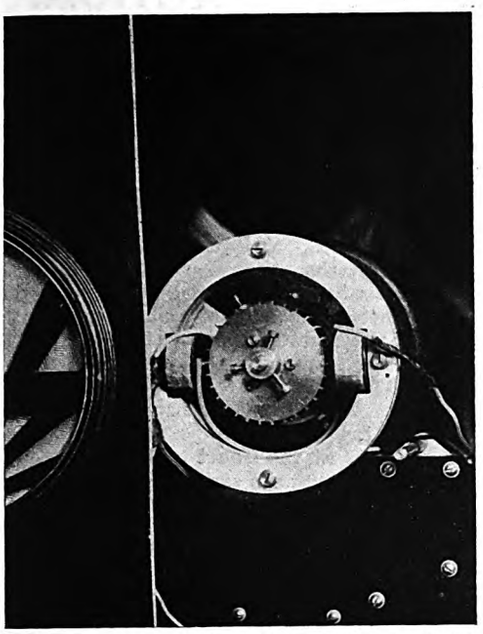
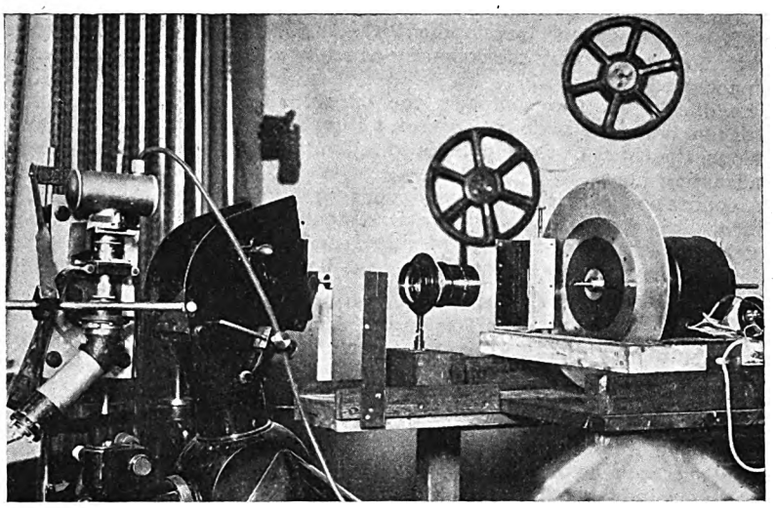
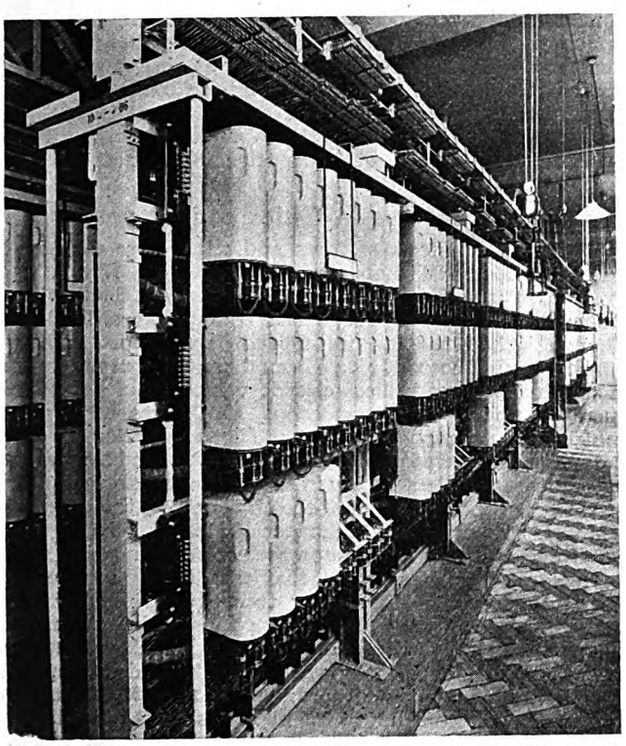
ELECTRICAL NEWS OF THE WEEK IN PICTURES.



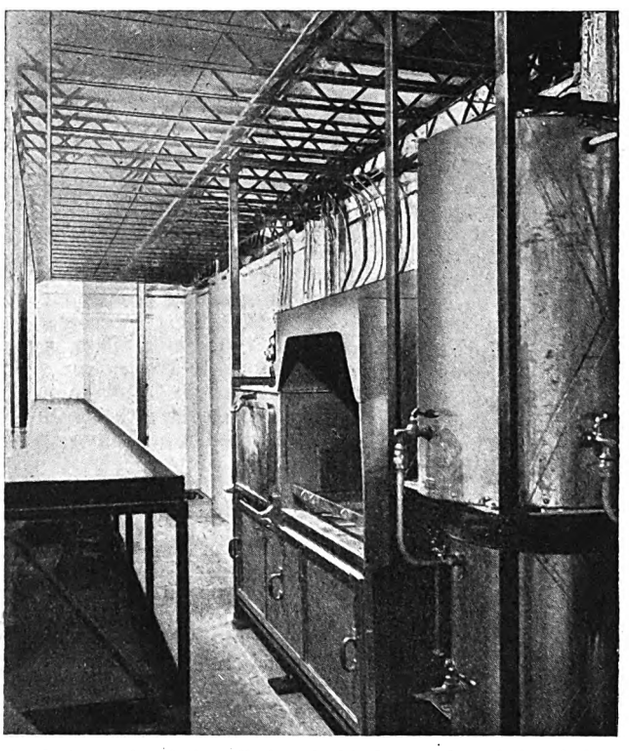
The automatic synchronising device as fitted to "Baird televisors." Though no licences have yet been granted we are given to understand that arrangements are soon to be made for the general manufacture of television receivers.



A general view of the Baird tele-talkie film transmitter as employed for television. Apparatus of this type is to be used, on occasion, when the transmission of television by radio through the B.B.C. stations commences. Though at the time of going to press no official date has been fixed for the first transmission it is believed that it will take place quite soon.



The rotary time-switch units at the new Metropolitan and National automatic exchanges, recently put into service in the Greater London telephone area. The whole of the equipment was manufactured by the Automatic Telephone Manufacturing Co., Ltd., and installed to the order of the Post Office.



A photograph of the all-electric kitchen on board the airship R.100. The ship, which is nearing completion in its shed at Howden, Yorks, has a capacity of 5 000 000 cubic feet, is driven by engines totalling approximately 4 000 H.P., and is capable of lifting 63 tons. All cooking and water heating is done electrically.

Marylebone electricity department has been informed that both the Commissioners and the Central Electricity Board desire the Council to proceed with the plant extension suggested, as bulk supplies will not be available from the grid in time to meet the Council's additional requirements. The Commissioners, however, will make the granting of the necessary loan conditional upon the Council giving an undertaking that it will take the best-known precautions for the due consumption of smoke and for preventing the emission of grit and the evolution of oxides of sulphur and, generally, any nuisance from the operation of the extension. Certain experts have been retained to report on the subject.

Stoke-on-Trent Housing Committee has approved the proposal of the Electricity Supply Committee to supply electricity to the houses to be erected on the Vivian Road site, Fenton, at a fixed price of 1s. per week.—The electrical engineer is to report as to the cost of applying electricity for cooking purposes at the isolation hospital.—A low tension distributor is to be laid to supply the houses in Blurton Road and Heron Street, Fenton, at a cost of £1 600.—A bulk supply is to be given to the Mossfield and Parkhall Collieries at £3 per kVA per annum, plus ½d. per kWh, on a coal basis price of 15s. per ton, subject to 0·015d. per kWh increase or decrease for each rise or fall of 1s. per ton in the cost of coal.

WIRELESS NOTES.

Experimental Transmissions of Television to be Made Through B.B.C. Stations.

A NEW offer for facilities for television transmission has been made by the British Broadcasting Corporation to the Baird Television Development Co., Ltd. The offer, though not regarded by the company as really adequate, has been accepted.

The offer gives the company the opportunity to make use of five half-hour periods per week for experimental transmissions, the times of these periods to fall outside the normal broadcasting hours.

In connection with these transmissions, it is interesting to note that it is stated that a definite agreement has been made whereby nightly transmissions of television will shortly be made from the Brussels station, from 10.30 p.m. to 11.30 p.m.

New "Columbia" Project.

According to "The Daily Telegraph," Mr. Louis Sterling, managing director of the Columbia Graphophone Company, announces that the company has decided to enter the radio field. The intention is to manufacture radio sets in this country on a large scale.

"It is possible," said Mr. Sterling, recently, "that as our scheme succeeds as much as £1 000 000 will be absorbed by the new industry here during the next twelve months. Employment will be found for some hundreds of workers.

"The radio business in England has not really started yet," added Mr. Sterling. "Since 1920, the progress made has been so rapid that sets soon become obsolete, and it is not surprising that the public are demanding better radio at much cheaper cost. This is what the Columbia Company intends to provide.

"In two years from now," prophesied Mr. Sterling, "practically all gramophones, except portable ones, will be combined gramophone-radio sets."

"Regional" Progress.

It is understood that the new high power B.B.C. station for the North of England will be known as Moorside Edge, and will be erected at Slaithwaite. The station will operate on two wavelengths, and contracts for the building of the station have, we understand, now been arranged. It is hoped to open the station in the middle of next year.

A number of buses travelling from Berlin into the country are shortly to be equipped with wireless apparatus for the reception of concerts.

The Japanese Department of Communications which established wireless communication with Europe in April last through the Nippon Wireless Telegraph Co., is about to establish a wireless station to communicate with the South Sea Islands. The station will be located near Tokyo and is expected to be completed by the spring of 1931.

THE NATIONAL REGISTER.

List of Applications for Registration Accepted at Last Meeting of Executive Committee.

AT a meeting of the Executive Committee of the National Register of Electrical Installation Contractors on September 6th, 23 applications for registration from electrical installation contractors were considered. Of this number 20 were accepted, two were declined, and one was withdrawn.

The names and addresses of the successful applicants are as follows :—

Pounder, John, Ltd., 58 and 60, Stockton Street, West Hartlepool.
Martin, J. E., and Son, 7A, Russell Street, East Parade, Leeds.
Taylor, George, and Co., 49, Clowes Street, West Gorton, Manchester.
Rayton, Thomas, 4, Eldon Terrace, Leeds.
McCrudden, J., and Son, 53, Duncairn Gardens, Belfast.
Fairey and Goodenough, Pontefract Road, Castleford.
Wrigley, John R., 46A, Virginia Street, Southport.
Johnson and Dare, 237, Lozells Road, Handsworth, Birmingham.
Smith, Horace, 177, Dewsbury Road, Wakefield.
Frampton, Percy J., 25, Birley Street, Blackpool.
Alderson and Beaty, 3, Commercial Street, Darlington.
Friend and Horton, 6, North Bridge, St. David's, Exeter.
Elvins, John, 112, Stoney Lane, Sparkbrook, Birmingham.
Wallis, G. E., and Sons, Ltd., 30A, High Street, Ashford, Kent.
Estall, Henry, 20, Thackeray Street, Kensington Square, London, W.8.
Shepperson and Dooley, 291, Archway Road, London, N.6.
Lummus, Thomas F., 49, South Street, Chichester.
Porter, W. T., and Co., 67, Stapleton Road, Bristol.
Main, E. V., and Co., 11, Hale Lane, Mill Hill, London, N.W.7.
Jackson, Alfred, and Co., 129-131, Granby Street, Liverpool.

ELECTRIC TRACTION.

Committee to Consider Electrification of Main Line Railway Systems.

THE Minister of Transport announces that the Government has had under consideration the advisability of obtaining a report upon the problem of the electrification of the main line railway systems of Great Britain. A Committee has accordingly been appointed, consisting of the Rt. Hon. Lord Weir of Eastwood (chairman), Sir Ralph Wedgwood, and Sir William McLintock, K.B.E., with the following terms of reference: "In view of the progress which is being made towards widespread availability of high tension electrical energy, to examine into the economic and other aspects of the electrification of the railway systems in Great Britain, with particular reference to main line working, and to report their conclusions." The secretary to the Committee will be Col. A. H. C. Trench, Ministry of Transport, 6, Whitehall Gardens, London, S.W.1.

During the proceedings at the Court of Inquiry regarding the Dublin United Tramwaymen's strike, Mr. F. Fitzgibbon, K.C., for the company, said of the whole of the operation charges borne by the company over 50% was the wages bill. There were charges which were imposed on the company when it had a monopoly. The increased competition—mainly 'bus competition—had destroyed the company's virtual monopoly. At the end of the last half-year the net receipts had fallen from £93 000 to £64 000. Mr. G. M. Harris, manager of the company, said the shareholders were not getting anything like a return on their money. The dividend last year was 4%. The proposed reduction of wages and salaries would represent £22 000. After the hearing of evidence and addresses on behalf of the various interests concerned, the inquiry was concluded on September 7th, when the chairman, Judge Davitt, announced that a report could not be presented for ten days, and that report would not arbitrate on the wages question. He suggested that the parties interested should consider (1) agreeing to accept a report on the wages issue; (2) resuming the services pending the submission of a report; and (3) endeavouring to reach a solution of the wages question on the basis of a report.

Tamways in Cities and Towns.

Transport problems of town and cities were discussed by Mr. W. I. Marshall, manager of Messrs. Dick, Kerr's Works, Preston, in an address to Preston Rotarians, on September 5th. He said the tramcar for dense traffic was still supreme, Though it had the heaviest initial capital cost, it had the lowest running cost. It had been definitely proved in towns in which tramcars, railless electric vehicles and petrol 'buses operated under equal conditions, the electrically-propelled vehicles were slightly the faster. The railless electric car was the passenger vehicle of the future. They avoided heavy capital expenditure, had less to pay in rates, were cheap to maintain, easy to run, and had none of the objections of the petrol 'bus.

Mr. R. Pilcher, general manager of Manchester Corporation tramways, states, in a report on the subject of noise in relation to the working of tramways, that with regard to the rolling stock used on the Manchester tramway system, the large double-bogie cars weigh roughly 14 tons each, and, fitted as they are with eight wheels, he believes that they cause more noise than single-truck four-wheel cars. The department has special cars fitted with carborundum blocks which grind out corrugations on rails during the night, and this work has been going on for some years. The crossings at tramway junctions are made of manganese steel. As the wear on the castings increases, the worn part causes a bigger gap or space, and consequently as the wheels pass over a greater noise is made. He has arranged to fill up the worn crossings and worn points by depositing steel by means of electric welding plants. The chains used to check the bogie from turning beyond a certain angle in the event of the car becoming derailed or taking a wrong point cause a deal of noise as the car passes over a crossing. He is of the opinion that a steel check can be fitted on the truck quandant and be quite as effective as the chains. The chains are now being removed, and checks are being fitted. Experiments have been made with a new type of hand brake, which causes the braking effect by pressing Ferodo blocks against steel discs fitted on the axles. Arrangements have been made to equip the forty new single-truck cars with this type of brake. A new motor suspension has been designed, and arrangements have been made to fit the new suspension on to all the present cars and on the new bogies on order.

COMPANY NEWS.

Improvement of Cables and Wireless "B" Stock—Marconi Marine also Rising—Edison Swan Co.'s Increased Profit—Crompton Parkinson's 30 % Dividend—Communications Co.'s Progress—Burndept's Record Output.

THE English Electric Company's ordinary shares have only slightly relapsed after last week's jump, the price remaining above 8s. General Electric shares are on the move again, advancing during this week 3s. 9d. Henley's, too, have improved half-a-crown, but Siemens shares are 1s. 3d. lower, and Ever Readies and Brush each 1s. Cables and Wireless "B" stock has regained favour, recovering 5 points to over 70; the "A" and preference stocks, after a slight weakening tendency, are back at last week's figure. Marconi Marine shares have risen 5s. to £3. South Metropolitan Tramways 4% debenture stock is 2 points higher at 70, and London United at 55 are 2 points down.

YARRA FALLS, LTD.—Div. at rate of 5% will be payable on Oct. 1 in respect of part-paid shs.

WARD AND GOLDSTONE, LTD.—Intm. ord. div. of 3½% actual, less tax (same rate as last year) is announced.

POSTAL TELEGRAPH AND CABLE CORPORATION.—Regular qrtrly. div. of 1¾% on 7% non-cum. pfd. stk. will be payable on Oct. 1.

ENGLISH ELECTRIC CO., LTD.—Directors announce that they are unable to recommend paymt. of an intm. div. on the pref. shs.

GLOBE TELEGRAPH AND TRUST CO., LTD.—Transfer books will be closed from Sept. 13 to 19, inclusive, for preparatn. of 1st intm. div. in respect of year to May 31, 1930, payable on and after Sept. 28.

ADELAIDE ELECTRIC SUPPLY CO., LTD.—Applications are invited until September 24 for an issue of £250 000 6% "D" consol. stk. at par, maturing in 1944. Existg. deb. stk. hldrs. have prior right of application.

Official Quotations.—The Stock Exchange Committee has granted official quotations to 12 612 £1 fully paid ord. shs. of the Underground Electric Railways Co. of London Ltd., and £85 000 6½% participatg. pref. stk. of the West Gloucestershire Power Co.

EDISON SWAN ELECTRIC CO., LTD.—Net pft. for the 18 months to Dec. 31, 1928, £76 991, agst £59 508 for year ended June 30, 1927, which, added to £31 903 brt. fwd., makes total £108 894. With the paymt. of 5% now proposed, total div. for the period on the ord. shs. is 15%, agst. 10% for 12 months. It is also proposed to transfer £50 000 (agst. £30 000) to res., making total of that acct. £250 000. Fwd. £18 929.

PETTIGREW AND MERRIMAN, LTD.—After writing down stks., fittgs., etc., and writing off premium acct. for lease of Bucknall Street premises, accts. for the 19 months ended July 31, 1929, show loss of £26 482. A further £44 297 has been written off other assets, and, after taking credit for a res. of £3 283 no longer required, net result is that adverse blce. of £13 102 brt. in is increased to £80 598. No div. has been paid on cum. pref. shs. since Jan., 1927.

MARCONI IRISH SHAREHOLDERS' ASSOCIATION.—At a gen. mtg. of this associatn. on Sept. 5, it was decided unanimously to wind up the associatn., as the shs. are now merged in Cables and Wireless. It was also unanimously decided to form a new associatn. under the title "Cables and Wireless Shareholders' Association," with the same chairman and officers. It was also decided to send a letter to the Board of Cables and Wireless suggestg. that the quotatn. of shs. on the Stock Exchange should be in pound units.

CROMPTON PARKINSON, LTD.—Net pft. for year ended June 30, 1929, after provisn. for depreciatn., deb. int., directors' fees, etc., £82 572, plus £44 550 brt. in. Div. on 8% 1st pref. shs. for six months to Dec., 1928, £6 829; div. on 6% 2nd. pref. shs. for same period, £9 803; intm. div. at rate of 11¼% actual on ord. shs. paid on March 31, 1929, £11 250. To gen. res., £13 500. Divs. of 4% on 1st pref. shs., makg. 8% for year, div. of 3% on 2nd pref. shs., makg. 6% for year and fin. div. on. ord. shs. of 18¾% actual, makg. 30% for year, are recommended. Fwd. £50 359.

IMPERIAL AND INTERNATIONAL COMMUNICATIONS, LTD.—The company announces that the purchase of the Imperial cables has been completed and the lease of the beam wireless stations taken up by the company. The other necessary agreemts. in connectn. with the cable-wireless merger have been exchanged with the Government, and it is anticipated that the Imperial cable and beam wireless services will be operated by the Communications company at an early date. These arrangemts. are in accordance with the recommendatns. of the Imperial Wireless and Cable Conference for the unificatn. of the telegraph services of the British Empire.

BURNDEPT WIRELESS (1928), LTD.—Accts. to June 30, 1929, covering a period of ten months' tradg., show net pft., subject to income tax, of £15 979. Bonus to staff, £375; premises res., £1 200. It is proposed to write off: goodwill, £1 660; one-third prelim. exs., £1 790; and one-third underwritg. commissn., £1 875; and to declare div. of 5%, less tax (equivalt. to 6% p.a. for the period). Fwd, £2 878. Directors consider these results entirely satisfactory, havg. regard to particular circumstances which were present during the period. Although the company acquired the business with

Digitized by Google

effect from Sept. 1, 1928, the receiver and manager remained in possessn. until Nov. 14, 1928, consequently the essential early preparatn. for the ensuing radio season was somewhat hampered, but despite this the output effected was much larger than in any correspondg. period in the history of the Burndept business. Directors are satisfied that the company continues to maintain its reputatn. for the excellence and high quality of its products, and look fwd. to an increased demand during current year for which the outlook is distinctly encouraging. In spite of keen and increasing competitn. at home and from abroad, the " Burndept " name is still prominently identified with the radio industry.

MUNICIPAL FINANCE.

Points from the Past Year's Accounts of Electricity Undertakings.

THE total revenue for the year 1928–9 of the 104 undertakings included in the following table and in the table which appeared in our issue of August 9th, was £18 710 480. The gross profit on the year's working of the undertakings was £8 780 983 and the aggregate sales of electricity amounted to 3 266 383 189 kWh, while 46 undertakings out of the total number have contributed out of the year's profits or from reserve an aggregate of £400 293 to the relief of rates. In many cases the costs include items of a capital nature, and net profits have been reduced as the result of reduction of charges for current. As it is desired to make these tables as complete as possible, the Editor will be pleased to receive similar particulars of other municipal electricity undertakings.

TAYLOR, S., 11, Furzedown Market, Tooting, wireless dealer. £29 16s. 10d. July 15th.

Deeds of Arrangement.

COOMBES, Walter John, trading as W. J. COOMBES AND Co., 36, School Road, and residing at 16, Hereford Street, Sale, electrical engineer and radio specialist. Dated September 5th, filed September 9th. Trustee, H. K. Poppleton, 76, Cross Street, Manchester, C.A. Secured creditors, £25; liabilities unsecured, £462; assets, less secured claims, £289.

HODGSON, George Arthur, Beacon View, Wakefield Road, and DENNIS, Herbert, 49, Victoria Place, Churwell, trading at Stump Cross Works, Britannia Road, all Morley, as G. A. HODGSON AND Co., electrical engineers, etc. Dated August 30th, filed September 6th. Trustee, G. Astle, 22, Park Row, Leeds, I.A. Secured creditors, £50; liabilities unsecured, £1 250; assets, less secured claims, £660.

RICHMOND, John Hunter Macnair, 6A, High Street and Arcana, Tuesley Lane, Godalming, electrical engineer. Dated September 2nd, filed September 7th. Trustee, W. A. J. Osborne, Balfour House, Finsbury Pavement, E.C., Cert. A. Liabilities, unsecured, £2 229; assets, less secured claims, £1 041.

Mortgages.

[NOTE.—*The Companies Act of* 1908 *provides that every Mortgage or Charge, as described therein, shall be registered within 21 days after its creation, otherwise it shall be void against the liquidator and any creditor. The Act also provides that every Company shall, in making its annual Summary under the Companies Act, specify the total amount of debt due from the Company in respect of all Mortgages or Charges. The following Mortgages and Charges have been so registered. In each case the total debt prior to the present creation, as specified in the last available Annual Summary, is also given—marked with an *—followed by the date of the Summary, but such total may have been reduced.*]

ADELAIDE ELECTRIC SUPPLY Co., LTD., London, E.C.—Registered August 29th, acknowledgment of indebtedness (supplemental to Trust Deeds dated June 11th, 1918) securing £250 000 D consolidated debenture stock, making in all £1 500 000 secured by said Trust Deed; floating charge on company's undertaking in Australia (excluding Dividend Equalisation Fund and uncalled capital). *£1 300 022. November 26th, 1928.

BRITISH ELECTRICAL INSTRUMENTS, LTD., Manchester.—Registered September 3rd, £400 debenture, to Mrs. A. E. Millward, 91, Chorlton Road, Brooks Bar, Manchester; general charge. *Nil. December 17th, 1928.

ELECTRIC PETROL SERVICE, LTD., London, S.W.—Registered August 30th, £2 500 (not ex.), mortgage or charge, to Lloyds Bank, Ltd.; charged on property in Finchley Road, Hendon. *£1 400. November 21st, 1928.

ELECTROLUMINATION (ABADIE PROCESS), LTD., London, W.C.—Registered August 20th, series of £2 000 debentures, present issue £1 000; general charge. *Nil. January 24th, 1929.

MEXICAN HYDRO-ELECTRIC DEVELOPMENT SYNDICATE, LTD., London, E.C.—Registered September 2nd, series of £20 000 debentures and premium of 100% on redemption, present issue £3 950; general charge (ranking in priority to £6 000 existing debentures). *£4 450. December 31st, 1928.

WATFORD ELECTRIC AND MANUFACTURING Co., LTD.—Registered August 26th, £3 000 debenture to Mrs. M. Anstee, Cassio Bridge, Watford, and another; general charge. *£8 900. December 31st, 1928.

Private Meetings, etc.

[Inclusion under this heading does not necessarily imply failure Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.]

PAGE ELECTRICAL EQUIPMENTS, LTD.—Unsecured trade liabilities of £1 187 were disclosed by the statement of affairs submitted to the statutory meeting last week of the creditors in the voluntary winding-up of this Birmingham company. There were also loan creditors for £440, making total liabilities of £1 627, as against which net assets were expected to realise £739, leaving an estimated deficiency of £888. The company was registered in the middle of December, 1926, with a capital of £500, which represented the excess of assets over liabilities (including an item of £300 goodwill) of the business formerly carried on by Mrs. E. M. Page. The cash creditors have undertaken to withdraw their claims, so that the trade creditors may receive the full benefit of the realisation.

London Gazette, etc.

Bankruptcy Information.

HINE, George Edward, trading as WIRELESS MAINTENANCE SERVICE, 17, The Promenade, Church End, Finchley, and 28, Mayfield Avenue, Finchley. First meeting, September 16th, 11.30 a.m., 29, Russell Square, London, W.C.1. Public examination, October 3rd, 1.30 p.m., Court House, Barnet.

SHAPLAND, Albert Edwin, Chippenham Cottage, Exmouth, Devonshire, journeyman electrician, formerly at 13A, High Street, Budleigh Salterton, electrical engineer. Receiving order, September 6th. Debtor's petition.

Notice of Dividend.

CHARNOCK, John Richard, top of Meanwood Road, Meanwood, Leeds, electrical engineer. Supplemental dividend, 1s. 2d. per £, payable September 26th, Official Receiver's office, 24, Lower Bond Street, Leeds.

Notices of Intended Dividends.

JOHN, Daniel Blodaufryn, trading as D. B. JOHN AND BROTHERS, 8, Commercial Place, Pontycymmer, and at Nanthir Stores, Nanthir Road, Blaengarw, electrical engineer. Last day for receiving proofs, September 20th. Trustee, E. Owen, 34, Park Place, Cardiff, Official Receiver.

RADCLIFFE, Harold Howe Delmé, and HADDLETON, Frank, 51, Islington Row, Birmingham, trading as CITY ELECTRIC SERVICES, electrical engineers. Last day for receiving proofs, September 25th. Trustee, C. Hoult, 191, Corporation Street, Birmingham, Official Receiver.

Partnership Dissolved.

HARRY BIBBY AND Co. (Eleanor Saunders BIBBY and Henry HORROCKS), electrical engineers, 4A, Bold Street, Warrington, by mutual consent as from August 31st, 1929. Debts received and paid by H. Horrocks, who will continue the business.

Rubber—Para fine, 10⅝d.; plantation, 1st latex, 10⅛d.

***. The metal prices are supplied by British Insulated Cables Ltd., and the rubber prices by W. T. Henley's Telegraph Works Co., Ltd.

THE LEAD MARKET.

The market was not so active last week, but, according to James Forster and Co., prices were well maintained and closed at the highest. The official price in New York was raised fifteen points to 6·90 cents on September 5th.

Closing prices on September 6th were £23 12s. 6d. for all positions, or 1s. 3d. to 2s. 6d. per ton higher on the week.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

314 889 P. H. Fuller. Sound amplifiers. (2/4/28.)
299 416 Deltavis Co. Contact plugs. (26/10/27.)
303 873 Deltavis Co. Contact plug for currents of great amperage. (13/1/28.)
314 836 Standard Telephones and Cables, Ltd. (Western Electric Co., Inc.). Electrical connecting plugs. (3/4/28.)
314 837 J. Neale. Police control of electric-lighting circuits of shops, banks, and the like. (3/4/28.)
314 838 C. Ruzicka. Light sensitive cells. (3/4/28.)
315 013 W. E. Barber. Electric terminals, bolts and the like. (3/4/28.)
314 839 General Electric Co., Ltd., and C. W. Stopford. Resistance elements for electrical heating apparatus. (3/4/28.)
314 890 H. H. Berry. Signs. (3/4/28.)
315 014 W. C. Tingey and Dubilier Condenser Co. (1925), Ltd. Dials for electrical condensers and the like. (4/4/28.)
315 015 W. E. Groves. Electrical socket-connections. (4/4/28.)
315 016 J. A. Kuyser, A. G. Ellis, and Associated Electrical Industries, Ltd. Electrical reactance coils. (5/4/28.)
314 929 J. E. Pollak (Hermsdorf-Schomburg-Isolatoren Ges.) Determination or measurement of voltage. (5/4/28.)
304 712 Electrical Research Products, Inc. Speed-regulating systems for electric motors. (25/1/28.)
315 018 H. Baron (Compagnie Lorraine de Charbons pour l'Electricite). Electric couplings and method of making same. (5/4/28.)
299 694 Ateliers de Constructions Electriques de Charleroi. Stator windings for alternating-current dynamo-electric machines. (29/10/27.)
289 030 British Thomson-Houston Co., Ltd. Electric resistances. (20/10/27.)
315 029 E. B. Moullin. Instruments for the measurement of alternating currents of any frequency. (21/4/28.)
315 039 Brandes, Ltd. (Federal Telegraph Co.). Variable-coupling transformer. (4/5/28.)
315 040 B. S. Cohen. Electro-acoustic converter, such as a loud-speaker.. (4/5/28.)
315 043 W. J. Tennant (American Multigraph Co.). Feed mechanism for keyboard operated embossing or like machines. (9/5/28.)
290 227 E. Aumuller. Apparatus for electrically lighting a railway train from the turbo-dynamo carried by the locomotive and from a battery provided in one of the carriages. (10/5/27.)
315 045 F. A. Eastwood and Associated Electrical Industries, Ltd. Dynamo-electric machines. (10/5/28.)
315 047 S. G. Williams, R. J. Williams, P. Pearson, and J. W. Templer. System of automatic signalling at cross-roads. (14/5/28.)
295 371 Sulzer Freres Soc. Anon. Absorption refrigerating machines. (11/8/27.)
315 049 J. G. Statter and G. S. Marston. Oil-break electric switchgear arrangements. (17/5/28.)
315 052 S. Gowan and Associated Electrical Industries, Ltd. Liquid rheostats or controllers. (19/5/28.)
291 103 British Thomson-Houston Co., Ltd. Electric condensers. (27/5/27.)
293 021 Forges et Ateliers de Constructions Electriques de Jeumont. Compensated asynchronous electric motors. (1/7/27.)
292 166 Telefonaktiebolaget L. M. Ericsson. Electric excess supply meters. (16/6/27.)
315 079 J. Neale. Method and means for the illumination of a light-sensitive cell. (19/6/28.)
315 085 English Electric Co., Ltd., and G. Schroeder. Synchronous dynamo-electric machines and synchronous electric motors. (26/6/28.)
315 094 P. Freedman. Electric arc devices. (5/7/28.)
294 538 Akt.-Ges. Brown, Boveri et Cie. Arrangement for preventing the entrance of air into spaces under partial vacuum, such as refrigerating plants. (25/7/27.)
315 106 P. Schmidmeier. Electric lamp holders of the bayonet type, and like electric connections. (24/7/28.)
315 114 Holophane, Ltd., and S. English. Illuminating appliances. (31/7/28.)
315 116 H. Hope and Sons and D. G. Page. Electric switches. (2/8/28.)
312 333 Naamlooze Vennootschap Philips' Gloielampenfabrieken. Illuminating devices. (26/5/28.)
299 841 G. Schapringer. Electric switches. (2/11/27.)
315 136 Chesterton, Jones, and Co., Ltd., and F. F. D. Davidson. Electric irons. (31/8/28.)
315 140 Ideal Werke Akt.-Ges. fur Drahtlose Telephonie. Loud speakers. (4/9/28.)
297 436 British Thomson-Houston Co., Ltd. Methods of protecting electric equipments. (21/9/27.)
308 765 G. de Gasenko. Incandescent electric lamps having means for giving different degrees of luminous intensity. (31/3/28.)
305 525 Condit Electrical Manufacturing Corporation. Self-contained rural transformer sub-stations. (6/2/28.)
303 148 Akt.-Ges. der Maschinenfabriken Escher, Wyss-et Cie. Apparatus for automatically controlling the operation of a refrigerating machine driven by a single-phase motor with a short-circuit armature. (30/12/27.)
308 676 Siemens-Schuckertwerke Akt.-Ges. Furnaces for annealing stampings. (26/3/28.)
300 588 British Thomson-Houston Co., Ltd. Transformers. (15/11/27.)
314 844 H. H. Berry. Signs. (3/4/28.)
315 175 E. D. Feldman. Electric motors. (20/11/28.)
315 179 Metallges. Akt.-Ges. and J. Zagorski. High-tension conductors. (23/11/28.)
315 183 H. Schonecker. Electric hand-signal lamp. (6/12/28.)
315 186 C. R. Burch, F. E. Bancroft, and Associated Electrical Industries, Ltd. Vacuum distillation. (19/7/28.)
314 845 H. H. Berry. Signs. (3/4/28.)
314 846 H. H. Berry. Signs. (3/4/28.)
315 191 A. E. White (Central Electric Tool Co.). Electromagnetic reciprocating motors. (13/4/28.)
314 891 G. W. Pierce. Magnetostrictive vibratory systems and apparatus for use in subaqueous and other signalling systems. (3/1/28.)
315 194 General Electric Co., Ltd., and E. H. Croft. Electric switches. (12/4/28.)

Applications for Patents.

June 17th.

18 622 T. H. Barnard and A. C. Goodwin. Suspension clamps for electric conductors.
18 585 J. Bauer. Electroplating metals with chromium.
18 629 P. Bitterman. Telephone covers.
18 633 S. Cox. X-ray apparatus.
18 630 L. E. Currah, and Igranic Electric Co., Ltd. Frame aerials.
18 610 J. Y. Johnson (I.G. Farbenindustrie A.G.) Production of electrodes for secondary cells.
18 637 K. G. Johnson, and Telefonaktiebolaget L. M. Ericsson. Circuit arrangements for relay switches.
18 626 Marconi's Wireless Telegraph Co., Ltd. Picture, etc., telegraph systems. (16/6/28, U.S.)
18 559 C. Marshall and Co. and W. B. Wilkinson. Synchronising sound reproduction and kinematography. (27/7/28.)
18 616 A. L. Muirhead and Muirhead and Co., Ltd. Electrical condensers.
18 613 N. V. Philips' Gloeilampenfabrieken. Electric discharge tubes. (16/7/28, Holland.)
18 555 Patent-Treuhand Ges. fur Elektrische Gluhlampen. Machine for evacuating and closing ampoules, etc. (16/6/28, Germany.)
18 632 Pye Radio, Ltd., and E. V. Root. Radio-receiving apparatus.
18 627 G. Unterberg. Magneto-electric ignition apparatus. (2/8/28, Germany.)
18 451 T. F. Wall. Electromagnetic testing of wire ropes.
18 615 Westinghouse Electric Manufacturing Co. Television systems. (23/6/28, U.S.)
18 542 Firm of C. Zeiss. Illuminating devices. (23/6/28, Germany.)

June 18th.

18 734 E. Asch. Control of high frequency generators. (5/7/28, Germany.)
18 705 E. A. Bitton, H. A. Storry, Ltd., and H. G. Bawtree-Williams. Inductance coils.
18 706 E. A. Bitton, H. A. Storry, Ltd., and H. G. Bawtree-Williams. Thermionic valve amplifiers.
18 702 British Thomson-Houston Co., Ltd., and F. H. Clough. Transformers.
18 742 Burgess Battery Co. Battery hand lamp. (19/6/28, U.S.)
18 709 Consortium fur Elektrochemische Industrie Ges. Process for uniting materials. (26/6/28 Germany.)
18 674 G. Halliday. Electrical geysers.
18 652 F. M. Lewis. Automatic voltage regulators.
18 698 S. Lipman. Electric signalling systems.
18 724 C. Lorenz Akt.-Ges. Picture transmission. (27/4/28, Germany.)
18 725 C. Lorenz Akt.-Ges. Signalling apparatus for aeroplane landing places. (13/3/29, Germany.)
18 720 Telefunken Ges. fur Drahtlose Telegraphic. Insulating material. (12/7/28, Germany.)
18 687 Telehor Akt.-Ges. Television apparatus. (17/12/28, Germany.)
18 688 Telehor Akt.-Ges. Transmission of pictures at a distance. (5/3/29, Germany.)
18 689 Telehor Akt.-Ges. Transmission of pictures and sound. (22/3/29, Germany.)
18 660 J. Wilson. Electric reproduction of sound.

June 19th.

18 806 Associated Electrical Industries, Ltd. Thermostatic controlling means for electric ovens.
18 886 Associated Electrical Industries, Ltd. Automatic electric control systems. (23/6/28, U.S.)
18 860 Associated Telephone and Telegraph Co. Recording at a distance. (28/6/28, U.S.)
18 815 A. D. Blumlein. Submarine signalling systems.
18 900 Brecknell, Willis and Co., Ltd., and A. M. Willis. Posts for supporting l.t. cables.
18 880 W. R. Bullimore. Cathodes for thermionic valves.
18 801 J. K. Burkitt, H. Langley and E. W. Marchant. Apparatus for indicating electric potentials, etc.
18 806 N. Dennes. Thermostatic controlling means for electric ovens, etc.
18 864 M. E. Elliott. Electrical sound reproducing apparatus.
18 840 General Cable Corporation. Oil-filled cables. (19/6/28, U.S.)
18 887 Hazeltine Corporation. Electric coupling systems. (14/7/28, U.S.)
18 901 A. E. Hughes and Liverpool Electric Cable Co., Ltd. Insulation of electric cables.
18 902 A. E. Hughes, and Liverpool Electric Cable Co., Ltd. Cleats.
18 903 A. E. Hughes, and Liverpool Electric Cable Co., Ltd. Electric junction boxes.
18 847 International General Electric Co., Inc. Means for preventing telephone cables being inductively affected. (21/6/28, Germany.)
18 892 Koch and Sterzel Akt.-Ges. Transformers. (15/12/28, Germany.)
18 898 Koch and Sterzel Akt.-Ges. Means for connecting earthed choking coils, etc., in cascade. (24/12/28, Germany.)
18 776 E. N. Kent-Lemon. Frame aerials.
18 859 J. E. Pollak (Excel Magneto Co.) Magnetos.
18 805 E. Potter (C. Kingsley). Means for testing magnetisable bodies.
18 838 Pye Radio, Ltd., and T. A. W. Robinson. Socket holders for thermionic valves, etc.
18 888 C. O. Roehrich and K. Wahl. Production of sound images on films, etc. (20/6/28, Germany.)
18 874 Siemens-Schuckertwerke A.G. Regulating transformers working in parallel. (22/6/28, Germany.)
18 875 Siemens-Schuckertwerke A.G. Oil-filled communication cables, etc. (28/6/28, Germany.)
18 820 G. E. Spero, and Truphonic Radio Co. Radio sets.
18 815 Standard Telephones and Cables, Ltd. Submarine signalling systems.
18 816 Standard Telephones and Cables, Ltd. Electric signal transmission systems. (26/6/28, U.S.)
18 817 Standard Telephones and Cables, Ltd. Means for reducing interference in signalling circuits. (20/6/28, U.S.)
18 830 J. Stone and Co., Ltd. Refrigerator plant
18 812 T. G. Weaire and J. G. Wright. Variable electric condensers.
18 905 W. E. Williams. Directional aerials for electromagnetic signalling. (9/11/28.)

June 20th.

19 002 Associated Electrical Industries, Ltd., F. E. Bancroft, C. R. Burch and N. R. Davis. Electric discharge tubes.
19 036 J. L. Baird and Television, Ltd. Speed governing devices for television apparatus, etc.
19 021 British Thomson-Houston Co., Ltd. Means for obtaining constant pressure in electrical apparatus utilising fluid insulation. (26/6/28, U.S.)
19 038 H. E. F. Connolly. Telephone instruments.
18 913 A. Davies. Apparatus for electromagnetic separation of metals.
19 039 Gramophone Co., Ltd., and A. Whitaker. Slow discharge devices used in sound recording.
18 938 C. M. Longfield. Electric protective system.
18 996 Marconi's WirelessTelegraph Co., Ltd. Signalling systems. (13/8/28, U.S.)
19 010 H. Pender. Electrical resistance devices.
19 009 A. L. Pugh. Electric resistance devices.
19 037 I. Silberstein. Fixing connecting wires to resistances. (30/6/28, Germany.)
18 918 T. F. Wall. Alternating current rectifiers.
18 988 W. J. Ward. Portable wireless receiving, etc., apparatus.

June 21st.

19 137 Associated Electrical Industries, Ltd., A. J. Hall and H. K. Ramsden. Motor control systems.
19 078 Associated Electrical Industries, Ltd., and R. Brooks. Electric current collectors for overhead conductors.
19 161 P. Baxter and J. L. Hills. Television apparatus.
19 095 British Thomson-Houston Co., Ltd. Selective circuit control. (22/6/28, U.S.)
19 096 British Thomson-Houston Co., Ltd. X-ray tubes. (25/6/28, U.S.)
19 105 Callender's Cable and Construction Co., Ltd., and A. B. F. G. Richardson. Machine for winding strip material on cables.
19 101 Cie Generale d'Electricite. Regulating supply of triple valves. (21/6/28, France.)
19 075 Electric Construction Co., Ltd., and W. N. Ringrose. Electric switchgear.
19 091 G. M. Gauvain. Apparatus for heating water by electricity.
19 134 E. S. Kreis and Lissen, Ltd. Alternating current rectifiers.
19 140 C. Lorenz Akt.-Ges. Direction finding. (19/7/28, Germany.)
19 176 G. Maché. Electrostatic telephone receiving instruments. (30/4/29, Germany.)
19 087 Metallges Akt.-Ges. Solid conductors for high voltages. (25/6/28, Germany.)
19 152 D. von Mihaly. Glow lamps.

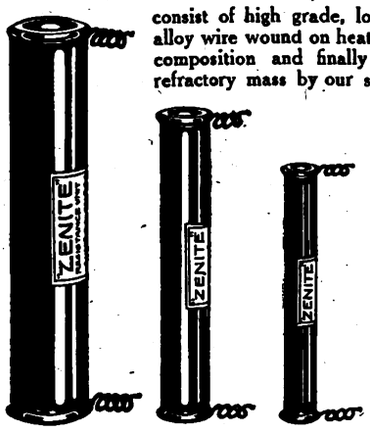
REGISTERED "ZENITE" TRADE MARK

VITREOUS ENAMELLED, EMBEDDED

RESISTANCE UNITS



consist of high grade, low temperature co-efficient alloy wire wound on heat-resisting tubes of special composition and finally embedded in a vitreous refractory mass by our special process.

For use in Motor Starters, Speed Regulators, Dimmers and for Protective purposes.

They can be supplied in seven sizes, 2" × ⅝" up to 8½" × 1½", and 130 standard windings between the limits of 0·1 ohm and 44 amperes and 150,000 ohms and 0·02 ampere; and can now be fitted with brass caps like cartridge fuses, a feature which makes for increased convenience.

WIRELESS WORK

"ZENITE" Units on account of their permanence are particularly suitable for "leaks" in connection with Medium Power Thermionic Valves as well as in the construction of Resistance Capacity Amplifiers.

COMPETITIVE PRICES and PROMPT DELIVERIES

Catalogue of Resistances and Units post free

The ZENITH ELECTRIC CO., Ltd.

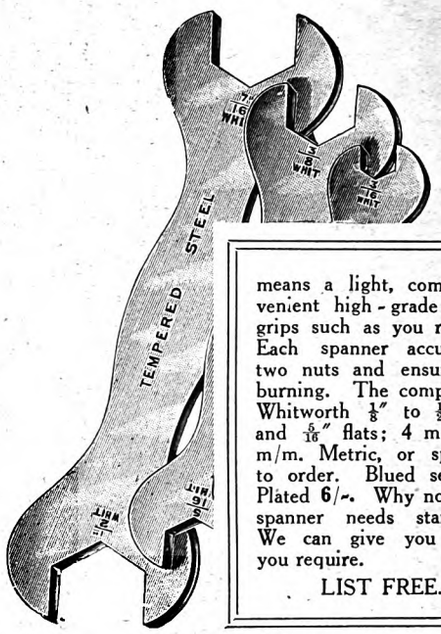
Sole Makers of the well-known "Zenith" Electrical Products.

Contractors to the Admiralty, War Office, Air Ministry, Post Office, L.C.C., etc.

ZENITH WORKS, Villiers Road, Willesden Green, LONDON, N.W.2.

Telephone: Willesden 4087-8. Telegrams: "Voltaohm, Willroad, London."

"TERRY" Spannerage



means a light, compact, convenient high-grade range of grips such as you really need. Each spanner accurately fits two nuts and ensures against burning. The complete set is Whitworth ⅛" to ½", and ¼" and 5/16" flats; 4 m/m. to 14 m/m. Metric, or special sizes to order. Blued set 5, **3/6**; Plated **6/-**. Why not get your spanner needs standardised? We can give you what you require.

LIST FREE.

Make your own tool racks—

Terry's "AVECTA" tool clips 3/- doz. with screws.

In case of difficulty please write us.

Public Lighting.

THE Sixth Annual Conference of the Association of Public Lighting Engineers, reported elsewhere in this issue, which has just taken place in Bournemouth, was an agreeable function, and, considering the tropical weather and the attractions of the sea-front, visitors proved conscientious in their attendance at meetings. The papers, whilst not containing anything very novel, furnished a useful survey of problems in street lighting, and the exhibition was a representative one. The chief impression one receives is the growing scope for service by public lighting engineers, who may in the future be called upon to undertake numerous additional duties, and who should lose no chance of educating themselves to meet these prospective demands. Even if they are not called upon to deal with "the lighting of a city as a whole," as was suggested in one of the papers, it is quite possible that the supervision of luminous traffic control devices and the lighting up of names of streets and house-numbers will come within their scope. We may also expect that public authorities will, in the future, be more keenly alive to the possibilities of artificial light in rendering their cities attractive. Decorative units of the type found in many American cities should prove specially suited to the lighting of seaside towns, and in the floodlighting of public buildings, gardens, bathing pools, etc., there are great possibilities. Apparently the present lighting of Bournemouth does not present any very striking features, though visitors had not a very good opportunity of judging during their brief stay. It would, no doubt, add to the interest of these conferences if some data on the local lighting conditions could be prepared beforehand, and if a tour through selected streets at night could be arranged as a regular practice. We would also like to endorse the suggestion, thrown out by Mr. J. S. Dow, that the Association might consider the preparation of an annual report surveying progress in public lighting in the chief cities of the United Kingdom. The paper by Messrs. COLQUHOUN and STEWART contained an excellent review of American street lighting progress. Why should we not have similar information about our own cities?

Some Startling Figures.

ONE does not look for technical accuracy in the columns of the popular newspapers, but seldom have we seen so patently improbable a story as that which appeared the other day in a London paper of large circulation. It purported to describe a conference attended by four experts in spinning and weaving, who "decided" on the general use of glass fibre for the insulation of electric cables. Although we believe the British Electrical and Allied Industries' Research Association investigated the possibilities of glass as a general insulator some years ago, the technical difficulties seemed insuperable, and nothing more has been done in this direction. The newspaper concerned, however, has not only discovered the way out, but has applied the method to cable manufacture. But this is not all. It has made two other astounding discoveries. The first is that the use of glass fibre "may result in the saving of a large proportion of the £22 500 000 which insulating materials for electric cables cost every year." If we roughly estimate the insulation as costing one-third of the total cost of the cable, our cable makers have an annual production worth no less than £67 500 000. The second discovery is no less astonishing, for we are told that the object of the experts was "to find a cheaper way of insulating the 78 million miles of cable that provide electrical power in this country." This surely refutes the suggestions, so often made in the past, that Britain is behind other countries in the use of electricity.

Railway Electrification Economics.

A REVIEW of Press comments on the announcement of the establishment of the new Government committee on main line railway electrification shows that while the advantages of electrical working are appreciated, there is a growing realisation of the importance of economic considerations. This modified outlook is definitely to be welcomed by those who wish to see the British main line railways electrified, for, as we have more than once pointed out, this is the one important factor upon which consideration should be focussed. Similar topics are in the news in the U.S.A. following the announcement of several ambitious main line electrification projects, estimated to cost about £40 000 000, in addition to schemes representing a capital expenditure of £27 000 000, which are now under way. The largest of the schemes that has been started is that of the Pennsylvania Co., which is electri-

Digitized by Google

fying its main line from New York to Wilmington with a view to eventual electrification to Washington. The largest prospective scheme, and one which would surpass that of the Pennsylvania, is that of the New York Central, which for some years has been contemplating the electrification of its line from New York to Buffalo. This scheme alone is expected to cost nearly £30 000 000. In considering these projects, however, allowance is made for the fact that where coal is plentiful it is not economical to electrify solely to reduce fuel costs, and that the only adequate reason for long-distance electrification on railways near ample coal supplies is to avoid traffic congestion. Already traffic on many of the lines is so dense that steam will soon be unable to cope with it, and it is instructive to note that all the lines which are being or are about to be electrified have very dense traffic conditions.

The New B.B.C. Station.

THE London regional transmitting station at Brookman's Park, which made its debut on Monday, is a worthy example of the skill and ability of the B.B.C. engineering staff. From the point of view of appearance, both inside and out, there is little to be desired, while the layout from an electrical point of view is also beyond serious criticism. Apart from these facts, it must not be overlooked that the main object of the station is to provide London listeners with alternative broadcast programmes at sufficient signal strength to cause sets of all types to respond. Whether or not the radiation of the new station will be such as to please listeners in all districts, time alone can tell, but we say, here and now, that it is doubtful. Crystal set users in the outskirts of the city are now comparatively near to the Oxford Street station, and it is reasonable to assume that these sets, when tuned to Brookman's Park, will not, in all cases, give the volume to which their users are accustomed. Though the B.B.C. engineers have done all that appears possible to avoid dislocating the service, it must be remembered that any temporary embarrassment will be followed by a general improvement all round when the remaining regional stations "take the air." A point of more importance, perhaps, will arise when the new station transmits on two wavelengths, for, though any modern receiver will separate the two programmes without difficulty, many of the older sets, and in particular, direct coupled sets, may give disappointing results. The reason for this lies not in the B.B.C. transmitter, but in the receivers, and it behoves every electrical contractor to read the special B.B.C. literature which has been prepared on the subject of selective reception. With the departure of Capt. P. P. ECKERSLEY from the B.B.C. so near at hand, the Brookman's Park station assumes added interest, as he was foremost in the creation of the regional scheme, and the station will be the last of his work as the chief engineer of the Corporation.

Salesmanship by Telephone.

THE possibilities of the telephone service as a means whereby manufacturers can make known to the trade throughout the United Kingdom the merits of their goods was demonstrated at a luncheon in London, on Monday, at the instigation of the Mullard Wireless Service Co. From Frascati's Restaurant to the General Post Office and thence relayed to Manchester, Birmingham, Leeds, Glasgow, Newcastle and Bristol, speeches were heard by parties assembled at similar luncheons in those cities. In this way the Mullard Company was able to announce details of its programme for the coming season, simultaneously to the whole trade, thus introducing a definite step forward in modern sales organisation by means of the telephone service. Both the Mullard Co. and the Post Office are to be congratulated on the success which attended the experiment, which, in the words of Mr. J. T. MOULD, chairman of the R.M.A., "was only a prelude to the time, not far distant, when similar conferences would be held, not merely in Great Britain, but all over the world simultaneously, enabling London manufacturers to speak to their representatives." It suggests itself to us that those responsible for selling the telephone service should do all in their power to develop this side of trade promotion. Visiting manufacturers and acquainting them with the advantages attending such broadcasting should do much to make the service generally attractive, while the Post Office authorities might even go further and arrange with other countries for interconnection with continental and American networks. The possibilities are vast and, with radio co-operation, universal.

British Export Trade.

SHIPMENTS of United Kingdom goods during August, at £63 045 000, were £3 475 000, or a little over 5·2% below the exceptionally large exports of July, but £828 000, or over 1·3% greater than in August, 1928. Taking together the first eight months of the year, exports totalled no less than £488 307 000, or £9 973 000 in excess of those in the corresponding period of last year. There was a fall of about 2·1% in the average export values in the first half of 1929, compared with the same period of 1928, so that it is probable that there was a greater increase in the quantity of exports in the eight months of this year than there was in the monetary value. Comparing August with July, there was a reduction in exports of £2 392 000 in articles wholly or mainly manufactured. Owing chiefly to an increase of £964 000 in the raw materials class, exports of imported produce were, at £9 020 000, greater by £1 050 000 in August than in July; there was also an increase of £264 000 when compared with August last year. From the point of view of visible excess of imports over exports for the eight months of 1929, the position is improving, the surplus being £209 481 000, or £28 016 000 less than in the corresponding period of 1928.

Trend in Electrical Trade.

THE position so far as our own industry is concerned is also reassuring, for, as will be gathered from the detailed figures of the Board of Trade Returns published on another page, electrical exports during August were £242 356 in excess of those for the same month last year. Similar imports for the month increased, by the same comparison, by £172 302. An analysis of the returns shows that the British electrical trade, so far as exports are concerned, is holding its own, for though the excess of exports over imports during August was as high as £930 469, for the eight months, the excess reached the even better level of nearly £8 000 000. Trade during the month under review was largely improved by shipments of wires and cables, which, between them, accounted for an increase of £164 882, while telegraph instruments, excluding valves, improved by £87 494. Strangely enough, wires and cables, excluding submarine cables, and telegraph instruments, were largely responsible for the increased import total, and though electrical machinery also increased in value, the remaining items either declined or increased only slightly. On the whole, the position may be regarded without anxiety, although it is the popular custom to hope for better things, and we feel that so long as we continue to put our backs into the export side of the electrical industry there should be little difficulty in attaining figures far in excess of last year's total.

Central Board Contracts.

INCREASED electrical export activity is accompanied by a further useful batch of orders, totalling about £808 000, for materials required by the Central Electricity Board in connection with its schemes for South-East and Mid-East England. The Board's policy of spreading out over a period the placing of orders for its various schemes is helpful to the British manufacturers concerned, in that it enables them to handle their normal home and export work without much disturbance of plant or workpeople, but we understand that inability to take delivery of equipment at the appointed time has caused some embarrassment to manufacturers needing room to proceed with work on new orders.

THE ECONOMIC CHOICE OF ENGINEERING PLANT.

The Importance of Considering Efficiency as well as Price—Total Annual Cost the Criterion—How to Compare Tenders.

By A. S. FENEMORE, B.Sc.(Hons.), D.I.C., A.M.I.E.E.

IT is generally recognised that it is not wise to purchase engineering plant on the basis of price alone, since the efficiency of the plant is also an important factor. A machine which has a low first cost, together with a poor efficiency, may be considerably more expensive to the customer in annual cost than one of higher efficiency, even though the latter may be appreciably higher in first cost. From the frequency with which orders are placed with the manufacturer who submits the lowest tender, it would, however, appear that due allowance is not always made for the poor efficiency which often accompanies a low price.

Assuming that all tenders comply with the requirements of the specification, the criterion to be used in a comparison of tenders is that of total annual cost. This is made up as follows:—

(1) The interest on the capital required for the purchase of the plant.

(2) The annual cost of the energy which must be supplied to the plant to enable it to perform the duty for which it is designed.

(3) The amount annually allowed for depreciation.

The interest referred to in item (1) is that already being earned by invested capital, and which will, of course, lapse on the withdrawal of the latter in order to effect the purchase; or where the capital is not already available, is that which must be paid on a new issue to provide the capital required.

The cost of the energy to be supplied will depend upon the output and efficiency of the plant and the load factor at which it is operated, as well as upon the price per unit quantity of energy, in whatever form the latter may be.

The value of all plant decreases with usage and the lapse of time, until finally it reaches some small value representing its worth either as second-hand equipment, or (if this is out of the question), as scrap. In either case, so far as the original purchaser is concerned, the equipment has reached the end of its useful life, and possesses only some small salvage value. It is then necessary to have a sum of money available, which, added to the salvage value, will equal the original cost, and so permit the purchaser, either to pay off the loan instituted for the purchase of the plant, or to purchase new equipment to do the same work. It is the function of whatever provision is made for depreciation to provide this sum of money, representing the difference between the original cost and the salvage value.

Allowing for Depreciation.

There are several methods of allowing for depreciation, but in determining the annual cost we are not much concerned with the actual method, since, whatever method is used, a certain sum has to be provided, and we are chiefly interested in knowing how much this is going to cost.*

We may suppose the provision consists of investing equal sums of money each year in an investment that is absolutely secure.† The usual method of effecting this is to institute a sinking fund. Equal sums are paid into the fund every year (or at more frequent intervals), and these sums allowed to accumulate at compound interest until at the end of the useful life of the plant the amount of the fund is equal to the first cost of the plant, less its estimated salvage value.

Let P = first cost of the plant (in pounds).
S = estimated salvage value (in pounds).
n = estimated useful life of the plant (in years).
r = rate of compound interest per annum for the sinking fund.

If a sum £A is invested at the end of each year at compound interest (the rate of interest being r), then:

Amount at end of
First year = £A.
Second year = £A + £A $(1+r)$.
Third year = £A + £A $(1+r)$ + £A $(1+r)^2$,

so that the amount at the end of n years is the sum of a G.P., of which the first term is A and the common ratio $(1+r)$, i.e.:

$$\text{Amount at the end of } n \text{ years} = \frac{A(1+r)^n - 1}{r}$$

and this must be equal to £$(P-S)$. Hence the annual charge of a sinking fund when payments are made into the fund at the end of each year is:

$$A = \frac{(P-S)r}{(1+r)^n - 1} \text{ Pounds.}$$

The Electrical Application.

The foregoing is of general engineering application. In what follows we shall be concerned with the particular application to electrical machinery.

Let η = efficiency of the plant.
N = hours per annum plant is run on load.
e = cost of energy (in pence per kWh).
i = rate of interest on the capital.

Then the total annual cost in pounds is:‡

$$C = Pi + \frac{(P-S)r}{(1+r)^n - 1} + \frac{G.N.e}{240\eta} \quad .. \quad .. \quad .. \quad (1)$$

Usually in a comparison of tenders all the quantities in this expression will be constant with the exception of the cost of the plant P, and its efficiency η. Strictly speaking, if S is taken to be a definite percentage of P, it will vary also, but since S will be small compared to P, variations in the value of S may usually be neglected. Should, however, there be a tender from a manufacturer whose products, in the opinion of the customer, do not represent the best practice, allowance can be made for this by taking a smaller value for the estimated life in this case.

The expression for the total annual cost contains so many variables that it is difficult to deal with in a general way, though its application to actual cases where all these quantities have definite values is straightforward enough. We may, however, illustrate its use by considering an example, and for this purpose reasonable values for some of these quantities must be established.

No general value can be given for the useful life of engineering plant, since this depends on many factors, all of which are liable to vary in particular cases. An average of the estimates of various authorities, however, gives about twenty years. The second-hand value of engineering plant is not likely, in general, much to exceed 10% of the first cost, while as scrap the value may be in the region of 5% of the cost.

For the purpose of illustration, we shall assume an estimated useful life of twenty years and a salvage value of 7·5% of the first cost. For these conditions, and making payments at the end of each year into a sinking fund at 5% compound interest, the annual charge for depreciation becomes:

$$A = \frac{P(1-0{\cdot}075)\ 0{\cdot}05}{(1+0{\cdot}05)^{20} - 1.} = 0{\cdot}0279P \quad .. \quad .. \quad .. \quad (2)$$

If the rate of interest, i, on the capital is also taken to be 5%, the total annual cost is then:

$$C = 0{\cdot}05P + 0{\cdot}0279P + \frac{G.N.e}{240\eta} = 0{\cdot}0779P + \frac{G.N.e}{240\eta} \quad .. \quad (3)$$

If tenders are invited for a machine for a particular duty, and one manufacturer "A" offers a machine with an efficiency η_1 at a price P_1, while another manufacturer "B" offers a

* See D. J. Bolton, "Electrical Engineering Economics," Chaps. 2 and 3.

† It is obvious that this is preferable to allowing these sums to lie idle year after year, since if this were done a larger sum would have to be set aside each year in order to reach the required amount at the end of the life of the plant, and the provision for depreciation would thus be more costly without giving any advantage in return.

‡ It should perhaps be stated that this is the total relevant cost so far as the question of economic choice is concerned; actually, there are additional costs, such as that of oil, stores, maintenance, etc., but in a comparison of tenders these items will be taken to be the same for all. These costs can therefore be omitted in the present problem.

Digitized by Google

machine with a lower efficiency η_2 at a lower price P_2, the total annual costs to the customer, with the values we have assumed, would be respectively :—

$$C_1 = 0{\cdot}0779P_1 + \frac{G.N.e}{240\eta_1} \quad \text{for A's machine;}$$

$$C_2 = 0{\cdot}0779P_2 + \frac{G.N.e}{240\eta_2} \quad \text{for B's machine;}$$

and the customer will make an economic choice by selecting the machine which has the lower annual cost. The difference between the annual costs of the two machines is :—

$$C_1 - C_2 = 0{\cdot}0779\,(P_1 - P_2) + \frac{G.N.e}{240}\left\{\frac{1}{\eta_1} - \frac{1}{\eta_2}\right\}$$

$$= 0{\cdot}0779\,(P_1 - P_2) - \frac{G.N.e}{240}\left\{\frac{\eta_1 - \eta_2}{\eta_1\,\eta_2}\right\} \quad \ldots \quad (4)$$

When this expression is negative, A's machine is the cheaper proposition, for then C_1 is less than C_2, and conversely, B's machine would be selected when $C_1 - C_2$ is positive. Alternatively, we may split up the annual cost into two parts :—(*a*) standing, or overhead, charges, and (*b*) running costs. Since A's machine, though more expensive is more efficient, we have :—

Increased standing charges for A's machine

$$= 0{\cdot}0779\,(P_1 - P_2) \quad \ldots \quad (5)$$

Saving in running costs for A's machine

$$\frac{G.N.e.}{240}\left\{\frac{\eta_1 - \eta_2}{\eta_1\,\eta_2}\right\} \quad \ldots \quad (6)$$

and when (5) is less than (6), then A's machine has the lower annual cost.

As an example we may consider the following alternatives for a 1 340 H.P. (1 000 kW), 1 000 r.p.m. d.c. motor, which is required to run on full load for 2 000 hours per annum, the cost of energy being 1d. per kWh.

Alternative	A	B
First cost	£1 250	£1 100
Efficiency at full load	94·3%	94·0%

In view of the appreciable difference in price and the small difference in efficiency, one might suppose that under the running condition specified (which is not unusual), machine B would have the lower annual cost. Let us see if this is so.

Increased standing charges for A $= 0{\cdot}0779\,(P_1 - P_2)$

$$= 0{\cdot}0779 \times 150 = £11{\cdot}7$$

Saving in running costs for A $= \frac{1000 \times 2\,000 \times 1}{240}\left\{\frac{0{\cdot}943 - 0{\cdot}94}{0{\cdot}943 \times 0{\cdot}94}\right\}$

$$= £28{\cdot}2,$$

so that the customer would save about £16 10s. per annum by selecting the machine with the higher efficiency, in spite of the fact that this machine costs £150 more in the first place.

An Unexpected Result.

This result is surely somewhat unexpected. One is led to wonder how many customers, when offered a machine at £1 100 with an efficiency of 94·0%, would be prepared to offer the manufacturer an additional sum of £150, representing about 13·6% of the price, to improve the efficiency of the machine to 94·3%. Yet, by so doing, the customer would save £16 10s. a year when running the machine on the duty specified, and in most cases the manufacturer would be able to effect this improvement in efficiency for less than the amount stated, with still further advantage to the customer.

The saving in question is certainly not large, but occurs with a load factor of 22·8%. If this load factor were doubled the saving in annual cost would be £ (28·2 + 16·5) = £44·7. On the other hand the running costs will vary in proportion to the cost of energy, and would, for instance, be halved where the cost of energy is ½d. per kWh.

The higher the load factor, the more important does it become to have the highest efficiency which is obtainable without too great an increase in first cost. In certain cases, for instance, motors driving ventilating fans for mines where the load factor may be in the region of 90%, or generating or converting plant for electrochemical work where the load factor may reach 100%, the effect of efficiency and the cost of energy become relatively of much greater importance.

Thus, in the example above, if the load factor had been 100% the annual saving in running costs, due to selecting machine A would be £123·7 with energy at 1d. per kWh, and the net saving would be £112. With these conditions the more expensive, but more efficient, machine, would save a sum equal to its own cost in the first eleven-and-a-quarter years of its life. Even with energy at ½d. a kWh the net annual saving would be £50·2 at this load factor.

The extraordinary importance of a good efficiency, from the customer's point of view, can be illustrated by further consideration of the example above, all quantities being as before, with the exception of the efficiency of machine B which will now be taken to be 93·27% in place of 94·0%. The annual saving in running costs for machine A now becomes £97·4, and we can proceed to find what difference in first cost must exist between the two machines for the saving in standing charges if machine B is selected, to equal the saving in running costs when machine A is selected. For this we must have :—

$$97{\cdot}4 = 0{\cdot}0779\,(1\,250 - P_2)$$

or :— $P_2 = 0$,

so that however small the price B asked for his machine, it would still be cheaper to buy A's machine for £1 250. Only by *giving his machine away*, could B place his offer at no economic disadvantage compared with A's offer.

Frequently in practice a machine runs on a varying load, and since the efficiency is dependent on the load, to make an accurate comparison in such a case the actual running time must be divided into such a number of intervals that during each the load is substantially constant. If the running costs for each interval are determined, their sum gives the total running cost.

In general, an average " load/time " curve is required :

(*a*) For one complete cycle, in the case of a machine operating to a succession of duty cycles ;

(*b*) For one day (or other convenient period), in the case of a machine operating on a load which changes arbitrarily ; this curve gives the output required from the machine at any point of the cycle, or period.

Another Example.

We shall assume as before that offers are received from two manufacturers, A and B, and that we have to make an economic choice between them. Each manufacturer will submit an " efficiency/load " curve of the machine he offers, or else the information from which such a curve can be plotted. The efficiency of each machine at any load can be read from its efficiency curve, and thus the input $I = G/\eta$ at each load determined, and hence an " input/time " curve deduced for each machine. If T is the time in hours occupied by one cycle (or period), the energy input per cycle (or period) is :—

$$\int_{t=o}^{t=T} I\,dt \quad \text{kW hours.}$$

and the difference between the inputs required by the two machines is :—

$$\int_{t=o}^{t=T} (I_2 - I_1)\,dt$$

The value of this integral is represented by the area between the two " input/time " curves, and is conveniently obtained by means of a planimeter if both curves are plotted with the same axes. If A's machine is more costly, but on the whole more efficient, than B's machine, then B's machine will require a greater input, and $\int (I_2 - I_1)\,dt$ will represent the additional energy which must be supplied to this machine due to its lower efficiency. In this case the annual increase in running costs which will occur if B's machine is selected, is :—

$$\frac{Me}{240}\int_{t=o}^{t=T} (I_2 - I_1)\,dt \quad \text{Pounds.}$$

where M denotes the number of duty cycles, or periods, per annum. The difference in standing charges is obtained as before, and it is then apparent which machine represents the better economic choice.

Where more than two competitive offers are received in response to an invitation for tenders, the same method can be applied by selecting one offer as a basis of reference, and determining the increase and decrease in running and standing charges, relative to this offer, for each of the remaining tenders.

STRENGTH OF WELDED JOINTS AND VESSELS.

Results of An Insurance Company's Investigation into Use of Welding for Pressure Vessels—Efficiencies of the Principal Joints.

THE annual Technical Report of the British Engine Boiler and Electrical Insurance Co., Ltd., is alway an interesting document. The issue for 1928, which has just been published (price 7s. 6d.), is, however, of particular interest, in that attention is almost exclusively directed to the results of the company's investigation into the use of welding for pressure vessels, a subject which is of growing importance to all those concerned with the welfare of power plant.

The report is so extensive in scope and detailed in treatment that it is impossible within present space limitations to do more than refer to some of the outstanding expressions of opinion which it contains.

It is pointed out in the preface that the use of welding for pressure vessels is extending and it is of the utmost importance that this use should be controlled and confined to legitimate channels. It would no doubt have been preferable had some authoritative body taken steps in the matter, but since none in this country has done so the company, as being to some extent in a tutelary position in regard to the public, decided to conduct its own investigations and to publish the results and the inferences drawn therefrom. It is thought that if as a result, official regulations are issued, the position which now exists—some claiming that welding is suitable for all purposes and others damning it for any—will be simplified.

During recent years, the report states, there has been an increasing tendency to employ fusion welding in the production of pressure vessels, and the absence of any official rules or regulations in this country which would guide design has resulted in a state of affairs which is utterly unsatisfactory to all concerned. So far as the company is concerned there can be no question but that the riveted joint is preferable to the welded joint, of which the actual efficiency depends so largely on the individual skill of the operator and the quality of the metal deposited.

At the same time, in view of the fact that welding is very often the most economic method of making a joint, and that it is a convenient means of obtaining tightness, a welded joint is entitled to consideration as an approved form of construction for an unfired pressure vessel, provided that it is properly designed and constructed.

Holding strongly that where there is risk of explosion safety must be the first consideration, the company decided to inquire closely into the various processes of fusion welding, the influences affecting the production of good work, the strength of the most common forms of joint, and any other matters germane to the subject—the immediate object being to obtain sufficient knowledge on which to decide what constructions should be permitted for pressure vessels, and what limitations, if any, should be set. The investigation, which has included the carrying out of many hundreds of mechanical tests, was limited in the main to the construction of vessels subject to air or gas pressure.

Though there certainly are elements in welding that are far from desirable, the disfavour with which welding is sometimes regarded is in a large measure due to the lack of control in matters of design and manufacture, whereas with vessels made to rigid regulations the undesirable elements would to a large extent disappear.

Causes of Accidents.

There can be no doubt that the bulk of the accidents that have occurred has been due to the welding having been carried out in a manner that no supervising authority could tolerate. For example, butt welds with the weld metal not penetrating the full thickness of the plate, fillet welds with far too small radii or with insufficient surfaces of contact, joints in vessels being situated where there is severe breathing, defective junctions due to inadequate preparation of the edges of the plate, and the use of low grade weld metal.

Though there may be a natural desire among manufacturers that their methods should not be interfered with, it was pleasurable to find that the better-class makers were by no means adverse to the inquiry. Some had already reached the opinion that it was inevitable that definite standards governing construction would sooner or later be called for, while others realised that a too rapid extension of welding in the absence of approved standards would react unfavourably on the trade. Several realised that the absence of restriction would undoubtedly lead to a set-back in the use of welded pressure vessels, owing to the resulting failures and accidents, while the imposition of reasonable regulations would assist the better manufacturers to compete with makers of an inferior article.

Investigation of welded boilers was for the most part limited to the construction of non-fired pressure vessels and as, judging from the criticisms that from time to time are levelled against the attitude of the engineering insurance companies towards fusion welding, the distinction between the two classes of vessel is not always appreciated, some of the differences in the working conditions are briefly described.

Arduous Conditions.

Where there is risk of explosion it is essentia' that there shall be no doubt of the ability of a seam to stand up to the working conditions. However, in the numerous examinations the company has made of faulty joints, faults have never been found of the same magnitude in a riveted as in a welded seam, and there is considerable doubt whether welded seams, as made at present, will stand up for a prolonged period to the arduous conditions imposed in a boiler.

It is to be remembered that a boiler is working under conditions that are far more strenuous than exist with a non-fired vessel. A boiler may have large temperature differences at the two sides of the plate, and an uneven temperature along the same side of the plate owing to its being covered partially by water and partially by steam. These temperature differences are augmented by improper circulation and by scale or oily deposit, and they give rise to stresses that even a solid plate is not always successful in withstanding.

The stresses brought about by uneven expansion are a serious consideration, more particularly where surfaces of welds are made with an irregular finish, while if the plate is undercut at the edge of a weld it is quite unsuitable for withstanding the normal breathing.

A common cause of trouble with riveted constructions is lack of circularity, and there is greater liability of trouble if distortion results from the heat of welding.

Though welded boilers are in service on the Continent evidence is still lacking that this class of construction, even when of the highest order, will reduce the troubles so common at seams.

If welded seams of a boiler are to have the same margin of safety as riveted seams, a radical departure from present designs and practices will be necessary, and this will make the welded construction less attractive to the manufacturer. Even if he himself were satisfied he would still have to satisfy the user that the cost of repairs to leaky seams and corroded joints would be no more than with the usual constructions.

For these reasons and because the design of non-fired pressure vessels working under much less arduous conditions is as yet far from satisfactory, it can hardly be expected that any responsible authority will sanction the welding of boilers, and in so doing depart from the Board of Trade rule whereby it is laid down that no joint in tension shall be welded. Self-generating pressure vessels are therefore only considered in so far as they contain parts on which welding is permissible.

Section II of the Report explains the basis adopted in testing and computing the relative value of the strength of the various forms of joint. It is pointed out that a statement that a joint of a particular form has a given strength is of little value, for a butt weld made by one process may have a strength of 20 tons per sq. in., but when made with another welding rod or by a different process or operator, 40 tons per sq. in. Another factor to be considered is that the strength of a weld made with electrodes of the same type will vary with the strength of the plate on which the weld is made. For the purposes in view the company has considered the absolute strength of a joint of a particular form to be of no consequence, and has found the most convenient information to be the strength expressed as a percentage—described as the "joint efficiency"—of a single-V butt weld made on similar material with the same welding rod by the same operator, the surfaces of the butt weld being machined down to the level of the plate.

As the strength of a reasonably well-made butt weld made with a given welding rod under standard conditions is gene-

C

Digitized by Google

rally a known quantity, knowledge of the joint efficiency gives at once the absolute strength of a particular form of joint made with any welding rod.

Though excellent pioneer work has been done with a view to ascertaining the strength of certain forms of joint, the company has found that available information is not always complete and that, owing to incorrectly designed test pieces, tests have not always been interpreted correctly.

FORM OF JOINT	η	REMARKS
NON-REINFORCED BUTT WELD.	100%	
LAP WELD WITH SINGLE FILLET. (SUBJECTED TO BENDING).	50%	UP TO 1" PLATE FOR CIRCULAR SEAMS. RATE UNLIMITED FOR LONGITUDINAL SEAMS OF PRESSURE VESSELS.
SINGLE BUTT STRAP (OF THE SAME THICKNESS AS THE PLATE.)	50%	ditto. FOR MODIFICATION OF STRENGTH WITH SHAPE OF FILLET SEE SECTION III, FIGS. 8 TO 10.
LAP WELD (NO BENDING).	60%	
LAP WELD WITH TWO FILLETS (SUBJECTED TO BENDING)	100%	NOT LESS THAN St. ONLY. SUITABLE FOR LONGITUDINAL SEAMS OF PRESSURE VESSELS WHEN t DOES NOT EXCEED ⅝".
HALF-LAP JOINT WITH TWO FILLETS (NO BENDING). (OF THE SAME THICKNESS AS THE PLATE.)	120%	
DOUBLE BUTT STRAPS. (OF THE SAME THICKNESS AS THE PLATE.)	120%	
JOGGLED LAP JOINT.	133⅓%	NOT LESS THAN 2t. ONLY SUITABLE FOR LONGITUDINAL SEAMS OF PRESSURE VESSELS WHEN t DOES NOT EXCEED ⅝".
JOGGLED LAP JOINT.	133⅓%	ditto.
BUTT WELD WITH SINGLE STRAP OF HALF THE PLATE THICKNESS.	-	AN UNSATISFACTORY FORM OF JOINT. BENDING STRESSES ARE INTRODUCED & COMPLEX STRESSES SET UP AT THE FILLET WELDS, WITH THE RESULT THAT THE STRAP ONLY INCREASES THE STRENGTH OF THE JOINT INAPPRECIABLY ABOVE THAT OF A PLAIN BUTT WELD.
BUTT WELD WITH SINGLE STRAP OF FULL PLATE THICKNESS. (OF THE SAME THICKNESS AS THE PLATE.)	SAY 120%	AN UNSATISFACTORY FORM OF JOINT NOT RECOMMENDED FOR PRESSURE VESSELS.
BUTT WELD WITH DOUBLE STRAPS OF HALF THE PLATE THICKNESS.	160%	
SPECIAL FORM OF LAP JOINT. WELD METAL IN SHEAR.	60%	STRENGTH IN SHEAR AS INTENDED. OWING TO THE DIFFICULTY IN MAKING A WELD OF THE FORM SHOWN, THE EFFICIENCY SHOULD BE TAKEN AS NOT HIGHER THAN 70%.
TRANSVERSE COVER STRAPS, WELDED AT THE SIDES ONLY.		THE STRENGTH DEPENDS ON THE FORM OF FILLET & IN GENERAL FRACTURE TAKES PLACE AT THE PLACE INDICATED BELOW.
DOUBLE STRAPS OF HALF THE PLATE THICKNESS, OPPOSITE ONE ANOTHER. (FRACTURE)	90%	THE STRENGTH OF THE WELD PER UNIT LENGTH IS 75% THAT OF A LAP WELD AT THE END OF THE STRAP.
SINGLE STRAP OF FULL PLATE THICKNESS.	75%	
SINGLE STRAP OF HALF THE PLATE THICKNESS.	45%	THE RESULT IS RELATIVELY HIGHER THAN BEFORE, OWING TO THE STRAP RECEIVING GREATER SUPPORT AGAINST BENDING.
TRANSVERSE COVER STRAPS WELDED AT ALL SIDES.		
DOUBLE STRAPS OF HALF THE PLATE THICKNESS, OPPOSITE ONE ANOTHER.	150%	FOR INFORMATION ON BUTT JOINTS WITH COVER STRAPS, SEE SECTION III., TABLE I & THE SUBSEQUENT LETTERPRESS.
SINGLE STRAP OF FULL PLATE THICKNESS.	125%	
WELDED FLANGES.	-	SEE SUBJECT MATTER RELATING TO FIGS. 24 TO 31 IN SECTION III.
BRANCHES & OTHER FITTINGS AFFIXED BY A FILLET WELD.	-	SEE SUBJECT MATTER RELATING TO FIG. XXVII., SECTION III.

Table showing efficiencies of some of the principal joints.

With a joint of higher tensile strength than the plate there is difficulty in determining accurately the strength of the weld. Several methods of overcoming the difficulty are suggested, none being free from some objection.

Section III contains notes on strengths of welded joints. A chapter is devoted to fillet welds and special forms of lap joints, and Section V is concerned with tests to determine the strength of samples representing joints of pressure vessels and other structures.

Joint Efficiencies.

Numerous tensile tests on plates varying between ¼ and 1 in. in thickness have been made on a great many forms of joint. Since a description of all these would be voluminous, and since a mere statement of tensile results, without reference to certain factors that enter into the making of a joint, would be of but slight value for the purpose in view, it has been considered that the information could best be given in a summarised form by a statement of the joint efficiencies.

For this purpose a non-reinforced butt weld made with the same welding rod, by the same operator, and on the same quality of plate is taken as standard for each determination, and all efficiencies have been given on this basis.

The efficiencies of some of the principal joints are given in the accompanying table. The values given have been found readily obtainable with reasonably well-made welds.

For fusion-welded pressure vessels a basic principle is that the strength of a joint shall be deemed to be not higher than half the strength ascertained by test, with the welding reasonably well carried out. Accordingly the efficiencies given are based on average results where the weld has been free from noticeable defect.

Emphasis must be placed on the fact that the figures given in the table are not the strengths that will be credited to a joint. They are for general guidance and it must not be assumed that even half the figures will necessarily be credited by responsible authorities.

The table should be studied in conjunction with the following explanatory notes :—

1. The efficiencies compare the strength of joints in plates of thickness t with the strength of a plate of the same thickness when butt welded, but without reinforcement.

2. The efficiencies refer to joints of the same width as the plate.

3. With fillet welds the efficiencies apply when the fillets have an approximately straight contour, lying at 45° with the surfaces of the plate. The efficiencies also apply to other contours as long as the throat thickness is not less than $\cdot 69t$.

4. A joint may readily be made stronger than the body of the plate away from the joint. As the efficiency refers to the joint itself and not to the plate, it follows that a higher efficiency than 100% can readily be obtained. It has been possible to record efficiencies, where they exceed 100%, by the adoption of specially designed test pieces.

5. It must not be inferred that all the joints shown are permissible for pressure vessels ; the figures given apply to a static tensile test, and it does not follow that the behaviour of joints subjected to the stresses of service will be in proportion to the efficiencies given.

6. The strengths given apply only when the load is applied in the manner shown in the sketches. The efficiency is therefore in some instances superior with the joint applied to the circumferential seam of a pressure vessel, and sometimes inferior when it is applied to a longitudinal seam.

Desirable Electrode Properties.

The report gives under the following heads what are considered to be the most necessary properties for metallic electrodes used for welding pressure vessels :—

(1) The electrode should contain not more than 0·03% of phosphorus, not more than 0·05% of sulphur, and not less than 0·50% of manganese. A higher percentage of manganese is strongly recommended.

(2) The rod should have a covering which has strong deoxidising properties, and which will react chemically with the mill scale and any rust on the plate being welded, and cause a slag to be formed, which will protect the surface of the weld from exposure to the atmosphere.

(3) The covering should have a melting temperature below that of the steel, preferably not more than 1 000 deg. C., in order that the operating current may be kept low, reducing the expansion of the welded part and the liability for the metal to be overheated, and allowing the molten slag to separate readily from the weld metal.

(4) The slag should have a coefficient of contraction greater than that of the metal, so that it may be removed easily.

(5) The electrode should be protected against rusting in a damp atmosphere, either by the covering or some other suitable means.

(6) The covering should be capable of withstanding temperature changes and the usual rigours of service that are to be expected during manipulation, without cracking.

(7) The electrode should deposit weld metal free from porosity and high in ductility.

The following additional properties are deemed necessary to meet special conditions of service :—

(8) When an electrode is used in a position where it has to be bent, the covering should be sufficiently plastic for a portion of the electrode, 9 in. long, to be bent to a right angle without the covering showing any sign of flaking off, the test being made after the electrode has been dipped in water and redried.

(9) When the electrode is for use on fireboxes of boilers, the quality of the deposited metal should be such that strips cut from welded plates can, while at a red heat, be bent and flattened without showing defect.

(10) When welds are hammered hot while metal is being deposited, or when the welded article is subsequently forged or subjected to deformation when hot, the quality of the weld metal should be such that strips of welded plate can, when at a red heat, be forged down to half their original area without showing defect.

In conclusion, it is not denied that many most excellent welds are made, and indeed a number has been examined during the course of the inquiry, but the quality of the ordinary commercial weld falls far short of the ideal, while many welds are definitely bad. Regulations are required if the legitimate development of welding is not to be retarded, and until such regulations are framed and enforced the company thinks it is inevitable that trouble and disappointment will be the lot of makers and purchasers alike.

PUBLIC LIGHTING ENGINEERS.

Proceedings at Association's Sixth Annual General Meeting and Conference at Bournemouth—Interesting New Equipment Shown at Exhibition—Applications of the Selenium Cell—An Arc Lighting Revival.

THE sixth annual conference and exhibition of the Association of Public Lighting Engineers was held in Bournemouth from September 9th to 12th. On arrival visitors were received by the Mayor of Bournemouth (Ald. C. H. Cartwright), at the Town Hall, where the meetings and exhibition were held. A preliminary opportunity was then afforded of viewing the exhibits, a description of which is given later.

On the following morning, when the Conference opened, an address of welcome was delivered by the Mayor, and the President (Mr. J. F. Colquhoun) briefly responded.

Presidential Address.

The new President, Mr. S. B. Langlands, was then inducted.

Mr. Langlands delivered a brief address, commenting on the progress of the Association, whose work had received recognition from kindred associations and public bodies. He urged that every city should have a public lighting department served by a well-equipped laboratory. In Glasgow the lighting laboratory had saved much money, and the systematic tests conducted therein had led to continuous improvements.

Reference was made to the comparative merits of underground and overhead mains for lighting, tariffs for gas and electricity, and the choice of materials for roads. Mr. Langlands suggested that a standard rate of 1d. per unit should be aimed at for public lighting in towns having more than 100 000 inhabitants, that more attention should be paid to the reflecting qualities of road-surfaces, and that supply cables for public lighting might often be safely and more cheaply installed if carried overhead.

Reference was also made to the International Illumination Congress to be held in England in 1931, and the hope was expressed that everyone would do his best to render this a success.

Lighting and Rating.

A paper entitled "Lighting and Rating" was then read by Ex-Baillie James MacDougall (Glasgow). The author reviewed legislation of the past bearing on public lighting, which, he suggested, should be placed under a special officer and dealt with by a separate department, such as had been adopted with success in Glasgow. A list of the expenditures of various cities on public lighting was given (see Table I), and it was

TABLE I.

City	Expenditure on Public Lighting per head of Population per annum. s. d.
Leeds	4 4
Glasgow	4 2
Manchester	3 6
Newcastle	3 4
Dundee	3 4
Liverpool	2 0
Leicester	2 7
Edinburgh	2 5
Aberdeen	2 4
Sheffield	2 4
Birmingham	2 2

pointed out that the allocation, which varied from about 2s. to 4s. per head of population per annum was considerably below the figure adopted by many American cities, where two dollars per head was considered a minimum figure. In the United Kingdom, however, lighting was not infrequently covered by a general rate, which included other items of expenditure.

The data for the various cities showed considerable variation in expenditure on street lighting in relation to population and rateable value (see Table II). Some effort should be made to arrive at standard procedure, and the first step should be to press to secure a special lighting rate in all cities. In the United Kingdom practically all expenditure on public lighting was met by public assessment, though in the United States the practice of defraying lighting partly out of special contributions by merchants was quite usual.

In conclusion the author referred to the variation in charges for gas and electricity, and to the high price of electric lamps in this country as compared with the United States. In both directions, he said, concessions would be welcome.

TABLE II.

	Population.	Ratable Value. £	Value Per Head. £ s. d.	Product of 1d. in £ Rate. £	Total Rates.
Glasgow ..	1 034 174	11 599 163	11 4 3	43,000	14/0·3
Birmingham	955 300	6,689,011	7 0 0	25,472	14/6

Sheffield ..	524 900	2 620 155	4 19 10	9 872	18/8

Following the morning session visitors were entertained to luncheon by the Bournemouth Gas and Water Co.

Compromise in Public Lighting.

On resuming, a paper on "Compromise in the Use of Illuminants for Public Lighting," was read by Mr. C. H. Woodward (Lighting Superintendent, Bournemouth). Compromise, Mr. Woodward remarked, occurs in two chief forms —compromise in policy, and technical compromise. The public lighting engineer frequently found that his decisions were governed by one or the other. Ordinary public lighting was in itself a compromise, seeing that the "tunnel" effect furnished by street lamps differed widely from the unrestricted natural illumination from the sky. A feature of public lighting was that the vertical illumination was frequently much higher than that on a horizontal plane. Compromise was again necessary when one attempted to modify the natural distribution of light by means of globes or reflectors. He had found, that even 500 W lamps could be exposed to weather without protection, as illustrated by the series of lamps mounted along the sea front. Another difficulty was the effect of trees. Foliage on either side of the street added to its beauty, but was apt to prove troublesome to the lighting engineer.

As illustrating the "pulling effect" of light on traffic the author described an interesting experiment. A friend was asked to drive his car with a single headlamp along the Undercliff Drive, whilst a camera was directed on the road from the top of the cliff. When developed the film showed a marked ripple in the course of the headlight. The driver had involuntarily hugged the curb at the parts of the road where the illumination was weakest.

In the later portion of the paper Mr. Woodward urged that extreme uniformity of lighting was not desirable, and put in a plea for artistry and decorative effect. Lamp-posts were either too plain or decorated, with too much elaboration.

Finally it was pointed out that ordinary street lighting consists in part of "positive" impressions similar to those produced by daylight, such that an observer sees an object illuminated in its entirety, and "negative" effects such that the object is seen merely as a silhouette against a light background. It was, as a rule, only in the immediate vicinity of lamps that the positive effect was experienced, but the proportion of positive and negative effect might be taken as an index of the quality of street lighting.

American Public Lighting Practice.

The morning of September 11th was occupied mainly by the lengthy paper by Messrs. J. F. Colquhoun and E. J. Stewart reviewing "American Practice in Public Lighting." This paper, which was illustrated by numerous lantern slides, was in essence a summary of the authors' experiences in connection with their visit to the International Illumination Congress held in the United States last September. The lighting conditions in a number of American and Canadian cities—New York, Boston, Lynn, Philadelphia, Washington, Cleveland, Detroit, Chicago, Niagara Falls, etc.—were briefly discussed. The authors also gave a summary of the discussion of the proposals put forward by the Secretariat Committee dealing with public lighting, in which the B.E.S.A. standard specification for street lighting figured prominently. The main feature of this specification is that it is based on measurement of minimum illumination, whereas in other countries average illumination is usually adopted. The final resolution recommended that in general both values should be given, and there

Digitized by Google

were other resolutions designed to initiate further study of suitable portable photometers, glare and visibility, and luminous traffic-con rol signals and their use.

Reviewing experience in American cities, the authors remarked that such defects as were encountered in that country were mainly due to excessive spacing and insufficient height. In American cities many very fine examples of lighting in main thoroughfares were noted, but it appeared that less attention was paid to side streets than was usual in this country. Principles of lighting, as indicated in the contributions of the American Illuminating Engineering Society, would nevertheless ensure good quality lighting. An average of 0·25 foot-candle, obtainable with an expenditure of 50—100 lumens per linear foot of street, was recommended for thoroughfares; 0·05 foot-candle, and 10 lumens per linear foot were proposed for residential streets. Lamps of less than 100 W were rarely seen in American cities. It was recommended that at least 1 000 lumens, and preferably 2 500 lumens per ft. should be used, and that the mounting height should not be less than 15 ft.

In the United States decorative appearance was regarded as of considerable importance, and pleasing examples of designs of posts and diffusing glassware were usual. In some cases, however, an incongruous assembly of decorative designs and unsightly wooden poles was found. Other features were the pleasing layout of installations in the parks, the introduction of special lighting in important thoroughfares by private effort, and the " booming " of street lighting by the manufacturing firms and local electric supply undertakings. In common with other authors Messrs. Colquhoun and Stewart emphasised the cheapness of electric lamps in America, as compared with prices ruling in this country.

The paper was concluded by a reference to the forthcoming International Illumination Congress to be held in this country in 1931, when an effort should be made to show visitors examples of well designed installations of public lighting.

Private Aids to Public Lighting.

The final paper, by Mr. J. S. Dow, was entitled " Private Lighting as an aid to Public Lighting." The author commenced by pointing out the inherent difficulties of public lighting, by means of lamps at infrequent intervals which were seen against a background of dark and feebly illuminated surfaces of buildings. In such circumstances the eye was in an abnormal " dark-adapted " condition, and was highly sensitive to glare. Uniform illumination could only be attained by accentuating the candle-power at angles slightly below the horizontal, and this almost inevitably led to glare. Really satisfactory street lighting could only be obtained by much closer spacing than was usual at present. In some Continental cities closer spacing was now being adopted, notably in Cologne where the ratio was only 3 : 1.

Redesigning a public lighting installation naturally meant expense, but it was possible that in dealing with important business thoroughfares the plan of inviting private support, which was quite general in America, might be tried. Lighting by private enterprise might also aid in the solution of another difficult problem, the lighting of arterial roads, passing through numerous country areas but designed for long distance motor-traffic between cities. In order to hold in check the unsightly effect of luminous traffic signals, illuminated placards, petrol stations, etc., on rural roads, some measure of control seemed desirable. Already our roads were coming to resemble railways.

In cities private lighting, whether in the form of illuminated signs and placards, floodlighting and architectural lighting, already added materially to the illumination received from public lamps. Here again, unsightly effects should be guarded against, but as the tendency was towards concealed lighting in such cases, the diffused light thus obtained might be very valuable, and might do much to limit the extreme contrasts found in unaided public lighting. Local authorities might themselves, in the future, make fuller use of these systems of lighting. They might also initiate the lighting up of house numbers and street names, and even the identification of important public buildings by means of unobtrusive but informative illuminated signs. Authorities in seaside towns, in particular, should recognise the possibilities of light in rendering such towns attractive by night.

In the future the public lighting engineer should take a wide view of his duties, and should ultimately feel himself responsible for the lighting of his city as a whole. In the course of his address Mr. Dow showed a variety of lantern slides, illustrating the part played by floodlighting in revealing buildings by night, and referred to the " festivals of light " recently organised in various Continental cities, which had proved beneficial not only to supply undertakings and makers of lighting appliances but to local traders as well.

DISCUSSION.

Several of the papers led to a considerable amount of discussion, one point that received special attention being the lighting of arterial roads. Mr. LENNOX pointed out the difficult position of parish councils in dealing with sections of rural thoroughfares. Mr. COLQUHOUN suggested that possibly such sections should be under the control of the County Surveyor, but it was hinted that parish councils were sometimes averse to interference. Mr. T. WILKIE thought that possibly the larger towns might assist their less wealthy neighbours, but the general impression seemed to be that as the lighting of arterial roads is essentially a national duty aid ought to be given by some such body as the Ministry of Transport.

The paper by Messrs. Colquhoun and Stewart naturally led to discussion on American practice. It was suggested that the ornamental diffusing fittings usual in large American cities might be more freely used in this country—especially in towns having considerable natural charm, such as Bournemouth.

Mr. A. C. CRAMB thought that a detailed comparison of costs of gas and electricity in this country and the United States might prove useful, and various speakers dealt with the question of the prices of electric lamps. It was pointed out that the United States had a great advantage in the fact of a single voltage being almost universal; also that their manufacturers, who produced large quantities of standard types, were naturally able to manufacture more cheaply than is possible in this country where outputs are smaller and the variety of types of lamps in use is so much greater.

The idea that traders in important thoroughfares might be asked to make a special contribution towards improved lighting created interest, and it was suggested that local authorities might make fuller use of light in order to advertise their towns —*e.g.*, by erecting floodlighted placards with the name of the town (and possibly particulars of places of interest, hotels, garages, etc.) for the benefit of approaching motorists.

The street lighting in Bournemouth itself excited some comment. Interest was expressed in the floodlighting of the War Memorial in the gardens, and an arrangement of three 1 000 W lamps in concentrating reflectors mounted on a high mast in front of the pier, which served to illuminate a very extensive area.

A useful suggestion put forward by Mr. J. S. Dow was that the Association should compile a yearly report, surveying progress in street lighting in the chief cities of the United Kingdom, for presentation at each annual conference.

The Exhibition.

The exhibition was again a comprehensive one, over 20 firms taking part; practically all the leading firms concerned were represented.

At the stall of the General Electric Co., Ltd., there was a complete exhibit of lanterns of the " Wembley " type, and photographs were on view showing the appearance of the Thames Embankment before and after the installation of these units. Other typical street lanterns were exhibited by Holophane, Ltd., Metro-Vick Supplies, Ltd., the Edison-Swan Electric Co., Ltd. (where the familiar units manufactured by the British Thomson-Houston Co., Ltd., were included), Korting and Mathiesen Electrical, Ltd., The Electric Street Lighting Apparatus Co., Ltd., Engineering and Lighting Equipment, Ltd., Revo Electric Co., Ltd., and the Wardle Engineering Co., Ltd. At the Holophane stall one of the chief features was the display of directional prismatic refractors, the range of which has recently been extended, and a highly ingenious chart to facilitate calculations with such units.

The " Street-Ray " unit, shown for the first time by Metro-Vick Supplies, Ltd., is an ingenious novelty, comprising a bowl-shaped reflector with a metal " flap " of special contour which, it is believed, will aid considerably in obtaining a directive effect, and will prove simple and inexpensive in operation.

As in former years a sharp division in design was evident in " directive " and " diffusing " lanterns. Perhaps the display of the Electric Street Lighting Apparatus Co. furnished the best example of " directive " design to obtain high candle-power at angles slightly below the horizontal, with a view to securing uniformity of illumination between posts. These

Digitized by Google

units, built up out of a series of mirror surfaces are now available in a great variety of types, one of the most recent being a conical " symmetric " unit.

A pleasing feature at the Edison Swan stand was the pictorial representation of " Rugby " units, composed of rippled diffusing glass. The Engineering and Lighting Equipment Co., Ltd., had a good range of diffusing lanterns of a new type which have, we understand, proved very popular in South Africa. The stall of Messrs. Korting and Mathiesen Electrical, Ltd., was noteworthy for the variety of lighting units displayed, and for the exhibit of the " Dia " long burning flame arc, the only arc lamp on view. These lamps have given a new lease of life to arc lighting, and types of very high candle-power have recently applied to the lighting of large squares in some Continental cities. The familiar range of units with mirror-reflectors (" Throlite," " Mirrorlite," etc.) was on view, and also the recently developed " Glowband " lanterns, which utilise a band of diffusing material, and have been widely adopted in Continental cities.

The Screening Band.

This idea of the screening band is also familiar in the Benjamin " Biflector " unit, which, with the standard R.L.M. and Rodalux units, was included in the display of Messrs. Siemens and English Electric Lamps and Supplies, Ltd. In common with other exhibitors, this firm did not confine itself to street lighting apparatus, but had on view a representative series of industrial and commercial units which included some pleasing totally enclosed diffusing glassware suitable for public buildings, etc. Many firms exhibited floodlight projectors.

Most of the stalls contained examples of the latest electrical accessories, in which notable improvements have recently been made. Some particularly ingenious mechanical devices for supporting and releasing glassware or reflectors were shown at the Edison Swan stall. Messrs. Venner Time Switches, Ltd., had a representative display, and Acme time switches were on view at the stall of Messrs. Engineering and Lighting Equipment, Ltd.

Finally, reference may be made to one or two special models and appliances. Luminous traffic control apparatus was displayed by Siemens and General Electric Railway Signal Co., Ltd., Metro-Vick Supplies, Ltd., and other firms. A particularly ingenious item at the G.E.C. stall was a model box with a peep-hole, through which the observer could see a typical street, illuminated by miniature lamps. So far as possible, the scale was adapted to give the correct order of illumination. By a simple adjustment perspective views of typical street-frontages could be inserted at the side, and by a mirror-device the final section of the roadway could be caused to run uphill or downhill. Similarly, by the turn of a knob, an apparently wet and shiny street surface could be substituted for a diffusing and dry one. By operating different combinations of miniature lamps quite a variety of street lighting arrangements could be shown.

The General Electric Co., Ltd., also included a demonstration of the action of a selenium cell and relay in operating street lamps, and this was shown on a more extensive scale at the stall of Radiovisor Parent, Ltd., whose system is now being experimented with in quite a number of cities. During recent years automatic control of street lamps by means of time switches has become very usual, but the application of the photo-electric cell is a novel development which should ensure that public lamps will be automatically lighted up whenever daylight has diminished to a predetermined value.

The Annual Dinner.

At the annual dinner, which was held in the Town Hall on the evening of September 11th, the toast of " The Corporation of Bournemouth " was proposed by ex-Baillie James MacDougall (Convener, Watching and Lighting Committee, City of Glasgow). The Mayor of Bournemouth (Ald. C. H Cartwright), in responding, sketched a charming picture of Bournemouth of the past, and showed how its adjacent pine-forests, portions of which are still in evidence throughout the town, have influenced the system of public lighting. The toast of " The Association of Public Lighting Engineers " was proposed by Coun. J. C. McKechnie (Convener, Lighting and Cleansing Committee, City of Edinburgh) and the President (Mr. S. B. Langlands) responded. The final toast of " The Visitors " was given by Mr. C. C. Paterson, and was responded to by Lieut.-Col. K. Edgcumbe and Mr. Harold E. Copp.

In the course of the Conference Ald. Bell extended an invitation to members to visit Leicester for the Annual Conference of 1930. This offer was gratefully accepted.

BROOKMAN'S PARK.

Brief Description of the New London Station—The Aerial Systems.

THE London regional transmitting station at Brookman's Park, which commenced test transmissions on a wave length of 356·3 metres on Monday, stands about 400 ft. above sea level. Power is generated by means of four Diesel engines coupled to a 220 V d.c. generator, while a 2 000 Ah floating battery used for light loads, can, if necessary, take full load.

The main motor generator room contains six large machines and a number of smaller types. In the centre of the room are three 160 kW machines for applying potentials between 7 000 and 12 000 V d.c. to the anodes of the main transmitting valves. The sets consist of three machines on one bedplate, the driving motor being coupled to two generators, each with two commutators capable of producing a voltage of 3 000, making 12 000 V maximum in all. The station is capable of transmitting two programmes simultaneously on two wavelengths, when two generators will be in use—one for each transmitter—with the third as a spare for either transmitter. The remaining three large machines are for filament heating, and give 1 300 A at voltages between 15 and 30. The arrangement is the same as in the h.t. machines, that is, one machine for each transmitter and one spare. The small motor generator sets supply grid negative voltages and separate anode supplies for the drive and modulated amplifier stages of the transmitters.

The transmitter hall contains the two transmitters and main switchboard. In the middle of the room are two control tables, one for each transmitter. Directly underneath each transmitter and the switchboard is a vault 7 ft. deep, which contains all wiring between the switchboard and the transmitters, and various accessories such as the pumps for the circulating water for the transmitting valves. There are also two small storage batteries for heating the filaments of the drive valves for which a steady voltage is necessary to prevent any risk of slight frequency changes.

The transmitters normally deliver 30 kW to each aerial and employ modulation at low power.

Operation of Transmitters.

The first operation in the transmitters is a drive stage, for which special precautions are taken to keep the frequency constant to within about 200 cycles. The output from the valve is applied to the separator stage, followed by the modulated amplifier, where the power level is approximately ¼ kW. The output from the modulated amplifier operates the first power stage, consisting of two water-cooled valves, the output of which operates the final stage of a maximum of eight valves on either side of a neutrodyned push-pull system.

The output circuit is coupled to a feeder system which runs straight out from the building and is carried overhead on steel standards to small buildings containing the aerial transformers and tuning circuits.

The circulating system for the water-cooled valves in the transmitters is of the enclosed type and is arranged so that water stored in two large closed tanks circulates through the valve jackets to two larger tanks in the vault.

Leading out of the main transmitter hall are two control rooms where the programme is received from the underground telephone lines running to Savoy Hill. These rooms—one for each transmitter—contain the necessary amplifiers, controlling and monitoring gear. In addition, the front portion of the building is occupied by offices, mess rooms, kitchen, etc., two sound-proof listening rooms, one for each transmitter, for quality checking by loud speaker, and a test room for taking measurements of the performance of either transmitter. A small studio for local speech or music tests is also provided.

There are four masts, two carrying the aerial for each transmitter. These masts are of the self-supporting type, insulated from earth at the base, but they are only 200 ft. high. This is lower than would have been chosen from the engineering point of view, but Government limitations would not allow of the height being exceeded. The span between each mast is 600 ft., and there is 900 ft. between the centre line of each aerial. The earth system, which radiates from the aerial transformer houses, consists of a number of wires buried 1 ft. below the surface of the ground, the ends of which form an oval extending about 200 ft. to each side of the aerial and 150 ft. beyond each mast.

Photographs of the station are published on page 343.

KILLING A YOUNG INDUSTRY.

Thoughts on the Eve of the Radio Exhibition—Relationship of Programme Interest to Listeners' Purchasing Capacity—Some Lessons from Other Fields.

By "HORAX"

THE Radio Exhibition opens next week, and the result of research and its application in this field will be on view to those who go to Olympia.

The radio industry will be "doing its bit," but the public is not increasingly wireless-minded. It cannot be expected to spend its money on equipment for the express purpose of being bored almost every evening.

That, frankly, is the position so far as many thousands of owners of wireless sets are concerned. Their sets are hardly used at all—not just because the novelty has worn off, but because the programmes offered to a long-suffering public are so heavy that they cease to be entertaining, and become a burden instead of a means of recreation.

Losing the Buyers.

We are not all high-brow or even medium-brow musical folk. Quite a lot of us are not musical at all, and yet we must endure concert after concert if we want to use our wireless set at all. Many of us do not, and so we cease to be potential buyers of wireless equipment. We do not much care if the battery is run down, and the accumulators can stay uncharged week after week, as the wireless set departs from a place of honour in the home to a corner in the lobby. We are not interested in better reproduction because we have had our fill of reproduction of Bach and Brahms, and we are weary of being instructed on subjects we do not desire to learn.

All this is not suggested as novel. It has been written and said *ad nauseam*. But the matter has passed beyond the stage of mere complaint so far as the person who pays the licence is concerned. It is hitting a new industry hard, and will continue to hit harder as more and more people become disinterested in the B.B.C., and consequently in their wireless sets. The gravity of the matter has been commented upon by a number of leaders in the trade, and the time is ripe for those so vitally affected to take steps to redress the position before it is too late.

What is wrong at Savoy Hill? "Too much Oxford and not enough Oxford Street," one shrewd writer remarked epigrammatically, and I think there is a lot of truth in the quip.

There is far too much desire to teach and to teach obviously. There is far too little of the popular mind in the direction of the B.B.C. Quasi-Governmental it may be; but it cannot remain on Olympus and yet try to maintain hourly contact with its mass of subscribers.

The success of wireless has been a spontaneous recognition of a great new force, and that recognition remains to be capitalised. We have not 50% of the sets we should have in this country, and we are losing as an industry all the new business we should obtain in this direction, with a great deal of the replacement trade as well.

We are agreed that the average programme is directed to the chosen few—chosen because those who make the choice are also of the "elect." We need programmes directed to the millions, since it is the millions who buy sets and would keep their sets up to date if they wanted to hear the programmes.

Assuming that the leaders in the world of radio manufacture are alive to the danger which confronts the industry, how do they propose to counteract the menace? They cannot sit still and hope, like Mr. Micawber, for something to turn up. If they do, the only thing that will "turn up" will be compulsory liquidation—that is no sort of an end for an undertaking in an industry so pregnant with prosperity as is radio—if only it can be given the right impetus.

Let us see if we can work out some suggestions for providing the "non-elect" mass of listeners with programmes that will encourage them to rescue their wireless sets from oblivion, and to bring them up to date with new and improved equipment.

In the first place, the preparation of the programmes needs to be entrusted to people who are in touch with the man in the street and the woman in the home—those thousands of homes into which the great popular papers go, the dailies and the weeklies.

If the majority of the nation were readers of "The Times" and the "Spectator" we should not have a "Daily Mail" or "Answers" with circulations running into enormous figures. The bookstalls would not be featuring popular periodicals by the score, and the picture houses would be empty and the music halls non-existent by reason of an almost complete lack of patrons. We come to this position then: the majority of the people of this country do not want education thrust down their throats. They want entertainment, and they are prepared to pay for it in the shape of popular fiction and features, and in the form of romance and humour in the picture houses and music halls.

Since popular journalism is palpably successful it would be a sound plan to get the assistance of the men who conduct these sections of the press; and since the picture houses and music halls secure patrons by the million each week, it can be assumed that those responsible for these undertakings are competent to gauge the public taste with a considerable degree of accuracy.

These would seem to be the men and women the B.B.C. might look to for assistance in providing the public with the form of entertainment that is required if the industry is to move on from strength to strength.

Would they approve of an evening's entertainment made up of: (*a*) A promenade concert; (*b*) a British composers' concert; (*c*) a pianoforte recital, to while away the hours between 8 and 10.30 of an evening, with interpolations of news bulletins as added attractions?

Just think for a moment what this class of "entertainment" means to the non-musical. Whether we like it or not, there is a large percentage of people who are not musical in the full sense of the word. They have no ear for music, and are not any the worse members of society for that reason. They can enjoy a jolly song with a rousing chorus. But Bach and Brahms leave them unmoved, and the works of modern composers of the higher school leave the ordinary listener quite cold. You do not get this sort of entertainment when you go to the halls or to the picture houses, nor do you read learned discourses on anthropology or the theory of relativity, when you pick up an illustrated paper or a monthly magazine.

A Programme Suggestion.

There is obviously a considerable body of informed opinion amongst the foregoing classes of "caterers" of entertainment, and it is not incredible that some of these qualified people should be formed into committees for the preparation of the various programmes provided by different stations of the B.B.C., and even if it were necessary to remunerate some or all of those who served on such committees it would not strain the financial resources of the B.B.C. unduly. At present they have an income running into some £1 000 000 a year at least, and even in these days that represents a sum which takes a bit of spending.

These committees would be responsible for the compilation of broadcast programmes in general, and their composition would secure a much more varied bill of fare for listeners. Such committees would be in touch with the world's activities and thought. They would know by their combination of experience what subjects interest the multitude, and they would so arrange each programme that every type of listener would get his or her fair share. They would not allow any one section—however worthy—to monopolise the air evening after evening whilst the remainder of those who own wireless sets seek entertainment elsewhere.

If we can once establish the principle that those who pay the piper are entitled to some voice in calling the B.B.C. tune, we shall have begun the work of "stopping the rot" which so indisputably threatens the British radio industry.

A revised directory of Central Electric Stations in Canada may be obtained, price 50 cents, from the Dominion Water-power Branch of the Department of the Interior at Ottawa. A Press bulletin on this subject also states that on January 1st last the available water power in the Dominion was 20 197 000 H.P. at ordinary minimum flow, 24-hour power at 80% efficiency, and the total turbine installation was 5 349 232 H.P. Of this turbine installation, no less than 4 445 693 H.P. is in central electric stations, the balance being in pulp and paper mills and in other industries.

RETAIL ADVERTISING IS AN INVESTMENT.

Some Practical Hints for Electrical Contractors—The Correct Appropriation for a Small Business—Circularising Possibilities.

By "SALES MANAGER."

WHEN one speaks of advertising to many a retailer, his eyebrows go up in mild horror. He seems to think that advertising means full pages in the big daily papers, at a cost of some hundreds of pounds. He does not realise that modern advertising expenditure is based for the most part on a percentage of turnover, and is, accordingly, an agreed amount fixed arithmetically, and not a series of haphazard sums spent on the impulses of the passing moments.

The average retailer is proportionately in just as good a position to advertise as national advertisers, if only he will follow a well-thought-out plan spread over a year.

Too many retailers allow themselves to be influenced by the persuasiveness of a representative in this matter of advertising, just as in the matter of stock. And it has been no uncommon thing to find retailers overstocked with advertising commitments just as they are carrying too heavy a line in certain goods. To these advertisers one can only reiterate the advice given by a leading sales manager, "Buy within your capacity," and so we need to see what is the capacity of a retailer to buy advertising.

We can assume that he knows his cost of doing business on a given turnover. If his turnover is increased, his cost of doing business will fall proportionately, and so he must be prepared to make some reasonable sacrifice in the present to secure a larger prosperity in the future. Every penny spent in sound, intelligent advertising is an investment, and there are many competent business men who regard the item of goodwill on a balance-sheet as a sort of relation to advertising expenditure. They maintain that money spent in advertising has created goodwill and they are prepared to pay for goodwill only when it is represented by pounds, shillings and pence spent in advertising.

There is a good deal to be said for this method, and the time will come when those who may wish to dispose of their businesses will point with justifiable pride to a reasonable annual expenditure in this direction.

A reasonable expenditure, it has been calculated, is represented by 10% on the projected turnover for the first year of a new business, 6% for the second year—the sum resulting from this 6% equalling the sum represented by the 10% by reason of the increased estimated turnover due to the advertising and percentage in the neighbourhood of 4% thereafter.

These figures have been tested and proved a thousand times, and they represent the most modern basis of calculating advertising expenditure. This expenditure is spread over the whole of 12 months, 52 weeks, 365 days. It is not a sudden drain on the financial resources of the advertiser. It is an allocation so imperceptible that it is hardly noticeable if the appropriation decided upon in January is maintained accurately until the end of December.

It is a sum, however, which can produce very important results. If we assume that a new venture has reasonable expectation of doing £3 000 turnover the first year—and these figures are not out of the way in a progressive business such as electrical retailing—there is a sum of £300 to be spent with judicious care.

It is not a great sum in itself as advertising figures go, but it is a handy bit of money to use in a localised effort.

Remember that the people you wish to reach are your fellow townsmen and fellow townswomen. You do not expect to sell all over the country, do you ? Your local papers are far more valuable to you than a great daily paper would be.

Space in local papers varies, of course, according to the circulation of the paper; but, for a sum in the neighbourhood

DISPLAYING LIGHTING FITTINGS.

THE approach of the lighting season turns the attention of electrical contractors and other retailers of domestic electrical appliances to window displays of lighting equipment. The new styles of fitting demand novelty in presentation, and the cube fittings introduced last year by the E.D.A. are useful adjuncts for a window showing modern lamps and shades. The accompanying picture shows how a modern setting imparts freshness to designs which are not particularly new.

Digitized by Google

of £2, you may expect to buy an imposing space of 4 inches across two columns—a large enough space to attract attention if it is filled with the right matter.

Assume there are two local papers, each of equal merit. To spend £2 a week in each would cost £208 a year and each paper would value your support. They would very reasonably appreciate the fact that something in the way of editorial assistance might be expected and they would doubtless be glad to give favourable notice to your displays and demonstrations. They would send a reporter round to see you whenever you had something novel in stock and they would regard your opinion on questions affecting electricity and electrical devices. Your £208 would mean a weekly message to your customers and would-be customers, and it would be your job to make that message interesting.

Remember that you have a subject of real interest to discuss. Everywhere the coming of the electrical age is welcomed; it brings new ease to the housewife, new interests to the whole household with better light and more leisure for study and recreation. It is only "in its infancy" and hardly a week goes by without something new and interesting being put on the market.

In short, there is real news in the new industry, and you can capitalise that fact to your advantage. Crisp statements backed up with facts and illustrated by blocks, the majority of which you will find your supplier glad to send you, and that 4-inch across two columns of space will become an item of interest every week to the readers of those local papers.

It is worth while to insist upon the same position in the paper being given you every week. People come to look unconsciously for a given advertiser's name in the same place when that name has appeared a few times.

All advertising is cumulative in value, and every insertion adds to the value of the next. In advertising it is "dogged as does it" and of all the requirements for success continuity is the most important.

Of our £300 we have £92 left to use if we are courageous to maintain our intention to spend 10 % of our conjectured turnover.

We can use this by direct methods of circularising, using to the utmost advantage the facilities provided by the post office. We shall have a number of leaflets sent to us by progressive manufacturers who will be glad to have our name and address overprinted in the appropriate space.

Choosing our leaflets so that the most suitable articles are pushed at the right season, we can keep up a steady fusillade of well-written, properly illustrated booklets and brochures, each of which is designed to interest the customer in a different line.

If we spend £2 a fortnight on circularising, we can cover 600 customers regularly, allowing for postage, envelopes and time for filling the envelopes.

If we alternate our first 600 names with another 600 we can send 12 messages to 1 200 people a year and if the 14 400 messages do not produce 5% of orders we must be going wrong somewhere. If we sell to 10% we shall be doing quite well, but taking the 5% only we may expect 720 orders from our campaign. If we only do 2½% we shall get 360 orders, and, at the low figure of £1 per order, we shall have got our money back with something to spare. What is even more important in this our first year of business, we shall have impressed our prospective clientele with our up-to-date methods and our anxiety to give service. We shall reap the benefit of this over the next year as well if we keep up our pressure and we can vary our campaign as our experience of the locality's requirements teaches what will go and what won't.

Our first year's expectation is £3 000, and our next year's is £5 000, of which 6 % equals our figure of £300, and the following year £7 500, with £300 again our advertising expenditure, the increase of business being due to our advertising, backed up, of course, by sound salesmanship, the greatest adjunct of which is courtesy and a realisation of the effect that penny wise is pound foolish.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

A Mystery Explained.

[To the Editor.]

Sir,—Your contributor "Battery Electric" affects to be mystified regarding the destination of the "electrics of yesteryear." He wonders where they are and why they have disappeared, as undoubtedly the majority have done.

His various suggested reasons are distinctly ingenious; but in my view the real explanation—apart from batteries—is to be found in the appalling lack of enthusiasm displayed by electrical men generally for anything electrical. Instead of asking "where are the 'electrics'?" why not ask "where are the members of the Electric Vehicle Committee, and what are *they* doing to generate enthusiasm for the fullest possible ecomonic use of electric road vehicles?"

I am, etc.,

September 12th. "Etubrute."

"Blackburn Again."

[To the Editor.]

Sir,—I would be glad of the opportunity to comment on the astonishing position revealed by the opening paragraphs of "Current Topics" in your issue of September 13th. As I understand it, the officer responsible for the Blackburn electricity undertaking has been summarily dismissed with a small honorarium without reason. I note that his Council has criticised to the extent that it was necessary to request outside authorities to investigate the undertaking, but, observing that their reports appear to have been a vindication of his action or behaviour, we are left with the uncomfortable feeling that the officer in question is being sacrificed for the faults of his Council or their Committee, and if this is actually the case, surely it amounts to wrongful dismissal?

With the greatest respect I would venture to disagree with the editorial opinion on competence or otherwise to dismiss servants. The fact is that damages (I believe that they have been assessed at ten years' salary) have been awarded under some or other sets of circumstances, and therefore masters are *not* always free under any or every circumstance to dismiss their servants. Not being a lawyer, I am unable to discuss the legal aspect, but in equity surely no man should be dismissed without good and sufficient reason, and if the reason stated is demonstrably unjust or incorrect, there ought to be grounds for damages.

I would suggest that this is far too important a matter to be treated locally, as it vitally concerns all professional municipal officers, and if the facts are as stated, the matter ought to be taken up legally by the national organisations with a view to defence of status.

I will conclude by quoting Baillie J. P. Dollan (sub-convener of the Glasgow Corporation Tramways) speaking at the recent Municipal Tramways Association Convention at Yarmouth:—"... What is the use of appointing managers and experts at large salaries to conduct the business of transport if corporations will not allow them to manage? If corporations are more competent to settle every question of detail affecting transport than the management, then they are wasting money in paying managerial salaries; they should undertake the duties themselves. Committees ought to be reduced drastically in number, and in a large city the maximum should be ten members, who should be carefully selected because of their interest in and knowledge of transport." He also remarks elsewhere that "municipal committees are cumbersome and their personnel excessive." If we read "electricity" for "transport" in the above remarks, they appear to be applicable to Blackburn in this instance.—I am, etc.,

J. G. B. Sams.

Advertising by Supply Authorities.

[To the Editor.]

Sir,—Although many of the suggestions made for advertising the electrical service given by supply undertakings are potentially beneficial, most of them require expenditure, either of time or money, on keeping the message readable. An example which I have noticed recently in certain London streets is not subject to such drawbacks, and though other suppliers may have used it, I have never previously seen so simple and effective a device. It consists of a sheet of brass or similar metal set into the covers of the mains inspection boxes in the footpaths, and bears in neat raised letters the words "Metesco Electricity Service." The constant passage of pedestrians serves to keep the metal bright, and the message must be read by a large proportion of those who pass by. It would be interesting to know whether other supply undertakings have tried this form of advertising.

I am, etc.,

LAMP PUBLICITY FOR 1929—30.

Special Lamp-Selling Material for the Coming Season—What the Manufacturers are Doing.

AS is usual at this time of the year, manufacturers of electric lamps are making preparations for various publicity campaigns and the issuing of new posters, showcards and literature with a view to increasing the sales of lamps during the forthcoming winter. The campaign for the "Mazda Five" for instance, includes the "Mazda" dancing girl, reproduced from the painting by Forster, which has already proved a popular feature of the last few months' Mazda publicity, and is given a prominent place in this season's campaign. It is reproduced in its natural colours for the purpose of window displays, showcards, catalogue covers, and for numerous pamphlets and folders. It will also form the basis of an attractive series of advertisements in the general press and trade papers.

Advertising has been specially designed to drive home the advantages of "the Mazda Five"—the "simplified line" of pearl lamps—and a series of advertisements will appear in the London and provincial newspapers. The same appeal will be employed in the various engineering, industrial and retail trade papers. A new coloured cutout window display features the Mazda dancing girl and consists of a three-piece screen, the centre portion being recessed and illuminated from above. The display is supplied complete with lamp-holder, flasher (to fit lamp-holder) and adaptor. There is an aperture in the top of the recessed portion to take the lamp-holder, which should be fitted with a 60 W lamp, the only item which the trader has to supply. The dimensions of the display when fully extended are :—Height 37 in., width 49 in., depth from back to front 6in. Of course, the amount of space occupied in the window depends upon the width to which the side panels are extended.

This season's Mazda showcard is similar to the one issued last season. It measures 22 in. high by 16 in. wide, and the dancing girl picture covers the full size of the card. A second showcard dealing with Mazda automobile lamps is also available. On the front of this a design forms a background for a panel in which full particulars, including prices and illustrations, are shown. On the back of the card particulars are given of the voltage and type of cap required for all motor cars, commercial vehicles and motor cycles used in the United Kingdom. Another attractive display item is a lamp rack made to hold a sample of each of the five lamps of the "simplified line." It is printed in blue and silver and is suitable for either window or counter display.

This season's complete catalogue contains full particulars and prices of every type and size of Mazda lamp manufactured for all lighting purposes, while a number of leaflets and folders dealing with pearl and other types of Mazda lamps for domestic, commercial and industrial purposes, and a small folder devoted to automobile lamps, are available for over-

(*Continued on page* 334).

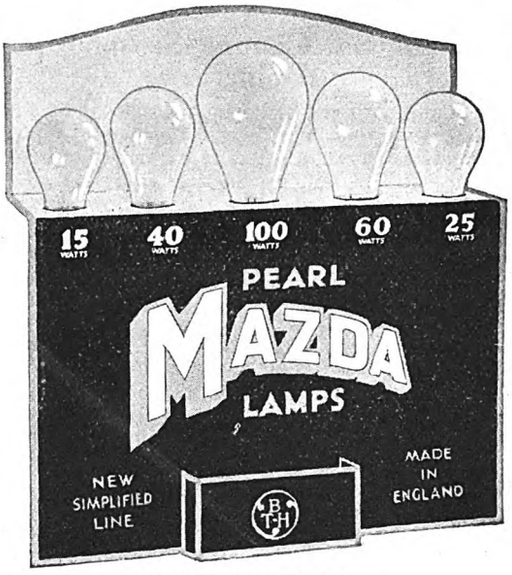
LAMP PUBLICITY MATERIAL.

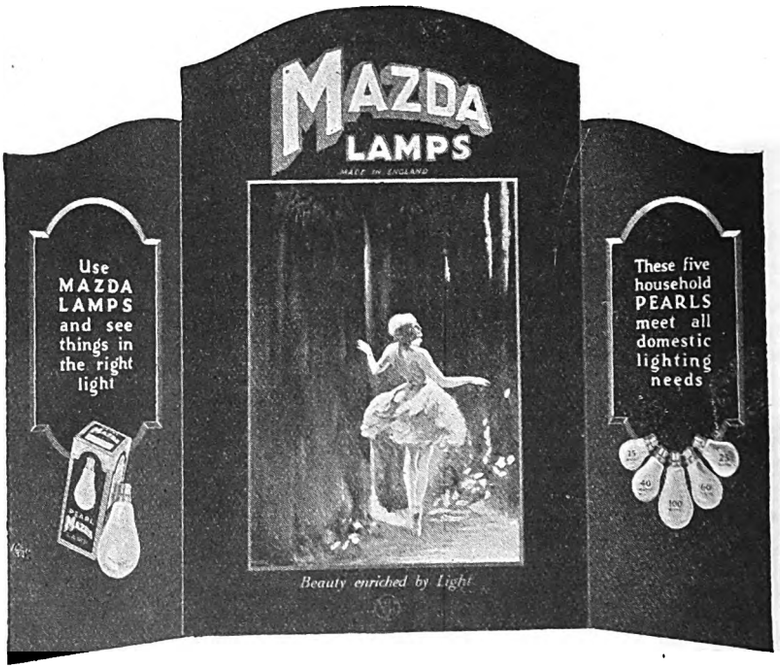
A new Philips' showcard.



The ' Mazda simplified line."

The special gramophone record which has been prepared by Siemens Electric Lamps and Supplies, Ltd., in connection with "The Popular Pair."

Another "Cryselco" showcard.



A new window cut-out of which details are given in the text.

printing with contractors' names and addresses. Finally, a special publication, to the trade only, entitled "The Mazda Five" book, gives some useful information about the 1929/30 advertising campaign.

The principal advertising features utilised in the campaign of SIEMENS ELECTRIC LAMPS AND SUPPLIES, LTD., of 38–39, Upper Thames Street, London, E.C.4, is known as the "Popular Pair." The design depicts a small girl holding aloft a magnified Siemens pearl lamp, followed by a small boy supporting a Siemens Silvalux lamp of equally colossal dimensions. The boy and girl are dressed in quiet shades of yellow, shown up by a background of brilliant blue split up by curved and variously coloured dividing lines of different widths and radii. Above flames the word "Siemens" in red letters with yellow facings, followed by "Pearl and Opal" in white and "electric lamps" in yellow. The same golden yellow shade is used for the slogan "The Popular Pair" beneath the children's feet. In the right-hand bottom corner a circular monogram in blue contains "British Made" in neat white lettering. The colouring and, indeed, the whole of the design, is unusually attractive. This poster design is now appearing on panelled hoardings throughout the United Kingdom and the Irish Free State. In addition, framed reproductions of this design are appearing in the lifts of all "tube" railways and on the tube stations.

Turning to advertising in newspapers and magazines, the firm will insert display advertisements in the leading London dailies, and also in a large number of suburban newspapers and monthly magazines. To reach large users in trades other than electrical, display advertisements will appear in more than 50 different trade journals.

To enable contractors to link up with the poster campaign Messrs. Siemens are providing for window displays a large number of centrepieces featuring "The Popular Pair" design which opens out on struts. This does not need special window dressing, and when opened the girl and boy, holding a pearl and opal lamp respectively, stand out from the background.

The design used for showcards is the same as that of the poster, and features pearl and opal lamps.

Messrs. Siemens are also providing an effective cardboard reflector sign, which, when hung in position to catch the light, has the appearance of being illuminated. Another novel form of publicity is the providing of a quantity of double-

Digitized by Google

sided 10 in. gramophone records bearing the firm's advertisement. It consists of a specially composed Siemens valse and a fox-trot entitled "The Popular Pair."

A forceful broadside entitled "Doubling up Sales," is issued by the GENERAL ELECTRIC CO., LTD., in which it is suggested that the pearl Osram "simplified line" is a straight line—the shortest distance between the consumer's need and its satisfaction.

With regard to the season's campaign, the services of the industrial and lay press throughout the country are being enlisted again this year, while the national advertising is being augmented by large quantities of multi-coloured showcards, window bills, signs and literature, overprinted with contractors' names and addresses.

The Osram showcard features a lion fashioned on cubist lines, yet poised to symbolise strength and grace of outline. It is designed to typify the supremacy, grace of outline and strength of the lamps. The moral underlying this season's Osram publicity scheme is well revealed by a cartoon which has been issued by the company. In this the dealer of yesterday who stocked "65 lines" is portrayed endeavouring to locate from his dust-ridden stocks a particular lamp to suit his customers of the same period. Alongside is shown a range of to-day's "simplified line," an up-to-date salesman and a typical customer whose needs can be met from a stock of five sizes only.

The publicity campaign to be launched from 145, Charing Cross Road, London, W.C.2, by PHILIPS LAMPS, LTD., will be to stimulate public demand through forceful "reminder" advertising. The trade will benefit directly through the demand thus created, while they will also be well supplied with price lists and window display material.

In addition to lamps, commercial and industrial fittings will be featured in many of the advertisements.

Briefly summarised, the principal London and provincial daily and evening papers will be used to bring the name "Philips" before the householder, and the outstanding advantages of Argenta and Duo-Savelite lamps will be emphasised. On the industrial side, the trade papers of the principal industries will be utilised. These advertisements will be devoted partly to lamps and partly to fittings, for which greatly increased sales are anticipated. Copies of four price lists will be supplied with quantities for distribution upon request. These are the general lamp price list (No. 101L), the Argenta (opal) price list (No. 181L), the Arlita (internally frosted) price list (No. 182L), and the Duo-Savelite folder (No. 173L). In addition, a comprehensive list (No. 100L) has been published for the use of traders. These publications are printed in several colours, with the exception of the Argenta list, which is a photogravure production.

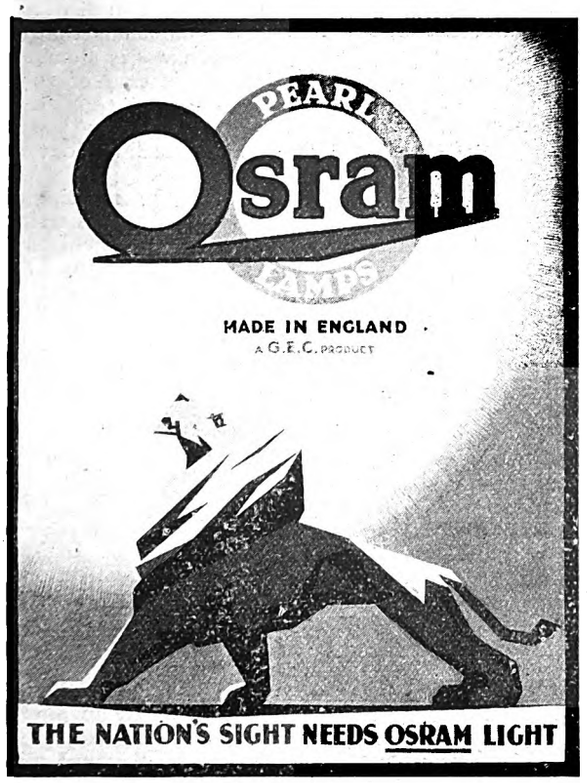
As in previous years, a staff of expert window-dressers will be employed. Their services can be obtained on the request of any trader willing to place his window for a short period at the disposal of Messrs. Philips. A limited number of large displays for windows of 8 ft. and over are available, a smaller display for windows of 5–8 ft., and a useful cut-out 3 ft. wide for smaller displays. Traders would also be well advised to apply for a useful selling device consisting of a counter demonstration stand showing a clear gasfilled and Argenta lamp side by side and inviting comparison. Three new showcards have been issued, size 15 in. by 10 in., showing respectively an Argenta lamp, motor car bulb and Duo-Savelite lamp.

One of the most notable features of the campaign to be started by CRYSELCO, LTD., Kempston Works, Bedford, is the publication of a booklet entitled "Night Lights." It purports to be written by "Col. Chris. Elco," of the Cryselco Light Brigade, and contains some quite original material.

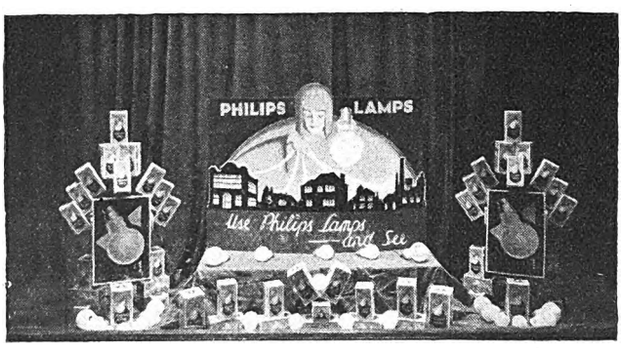
Among their display advertisements for this season Cryselco, Ltd., are retaining their well-known feature, "The Lamp with Two Skins."

The NOX ELECTRIC LAMP CO., LTD., of Clarence Road Works, Hunslet, Leeds, are issuing a special "Train of Thought" advertisement, and have transparencies for window display.

FURTHER AIDS TO LAMP SALES.



An attractive showcard issued by the General Electric Co., Ltd.



A suggested window display featuring Philips' Lamps.

NEWS IN BRIEF.

South African Electrical Imports—Electricity Consumption in Switzerland—The E.D.A. Outlet Campaign—The Manchester Radio Show—Television by Radio.

NEWARK Corporation requires a chief engineer for its electricity undertaking.

The 13-ton bell at Erfurt Cathedral—the Gloriosa Gloche—is being equipped for electrical operation.

The new X-ray apparatus in Whinney House Tuberculosis Hospital is to be formally inaugurated shortly by the resident medical officer, Dr. Pearson.

In furtherance of its publicity scheme for encouraging new industries, Bristol Development Board is organising a poster competition The posters are to convey the idea that Bristol is the best place for new factories.

The Mitcham (Surrey) automatic telephone exchange was put into service on September 11th. It opened with about 750 lines, and has an ultimate capacity of 1 480.

The Customs and Excise Department of the Union of South Africa reports that imports during the March quarter of the present year included electrical machinery valued at £369 868 and electrical material £261 470.

Statistics of the trade of Estonia during June last show that the imports included electrical machinery, apparatus and implements valued at 282 000 krons, and exports of the same classes of goods amounting to 26 200 krons.

It is reported that during 1928 Swiss electric power works produced 5 300 000 000 kWh, compared with 1 700 000 000 in 1913. The consumption of electricity in Switzerland in 1928 was equal to 1 070 kWh per head of the population, compared with 907 in 1927.

A novel feature in the new Jewish Synagogue, Bury Old Road, Crumpsall, Manchester, which has cost between £25 000 and £30 000, and was consecrated last week-end, consists of electric lamps of various colours, which are located in the dome and project their light upon the Ark and the reading desk.

Sheffield Corporation Electricity Committee has decided not to support the resolution of the Newcastle-upon-Tyne Corporation for the certification and stamping of all electric meters.

In connection with a scheme for improving the water supply at the Hampshire Joint Mental Hospital Committee's Knowle mental institution, at a cost of about £10 500, electrical machinery is to be installed.

Bolton, which is said to be the third largest centre of population in Lancashire, is holding a "civic week" from to-day (September 20th) to September 29th. Lord Leverhulme will open to-day an exhibition wherein are shown the 300 manufacturing activities of the town, apart from the cotton industry, and amongst the interesting places which will be visited, in the course of special omnibus tours, are the electricity works and the tramways depot and workshops.

The Calendar of Brighton Technical College for the session 1929–30 contains lists of the governors and the teaching staff, information as to fees, scholarships, and the equipment of the electrical and engineering laboratories, syllabuses of the engineering and other courses, and a number of excellent illustrations, including views of the College, the engineering workshop, the laboratories and the Withdean recreation field. The new term's evening and day courses commenced on September 16th and 17th respectively.

Southend-on-Sea Corporation requires a mains engineer in the electricity department.

A demonstrator in electrical engineering is required at the City and Guilds (Engineering) College, London.

It is reported that an English company has submitted to the Portuguese Government proposals for a national telephone service, with connections to the international lines.

In connection with the E.D.A. Electric Homes (Outlet) Campaign an area conference will be held in the Demonstration Bureau, 4, Fountain Street, Manchester, on September 23rd at 3 p.m. Lt.-Col. W. A. Vignoles and other speakers will deal with the principles underlying the campaign and the methods which will be adopted to ensure its success.

The Aldershot Gas, Water and District Lighting Co., Ltd., will open in October electricity showrooms at Hindhead.

The "Manchester Evening Chronicle" Radio Exhibition will take place from October 16th to 26th. For further details application should be made to Provincial Exhibitions Ltd., City Hall, Manchester.

Mr. Bruce, the Australian Commonwealth Prime Minister, stated, last week, that a merger between the cable and the wireless interests had not been contemplated in Australia. Negotiations were proceeding for the co-ordination of the work of the two systems.

The Dublin tramwaymen, who have been on strike five weeks, have agreed to accept the report of the Court of Inquiry which has been considering the matter in dispute. The Court recommends that the reduction in wages should be 1s. per week instead of 10%. If the tramways' company also accepts this proposal the service will be resumed without further delay.

The opening meeting of the Illuminating Engineering Society will be held at the E. L. M. A. Lighting Service Bureau, 15, Savoy Street, Strand, London, W.C.2, on Tuesday, October 8th, at 6.30 p.m. A report on "Progress in Illuminating Engineering," prepared by the Papers Committee, will be presented, and there will be numerous exhibits of colour films, illuminated signs, and new lighting fittings.

The premises of Northants Electrical Installations, Ltd., Peterborough, were struck by lightning and set on fire on Wednesday, considerable damage being done.

The calendar of the Royal Technical College, Glasgow for 1929-30 (the 134th session) consisting of over 450 pages has been published, price 2s. 6d. (post free 3s.). In addition to a history of the college, lists of professors, lecturers and assistants, conditions of admission, fees, etc., it contains particulars of the subjects dealt with in the day and evening classes, information relating to bursaries, scholarships, prizes, etc.

The British Broadcasting Corporation and the Baird Television Development Co. have issued jointly an announcement that the experimental broadcasting of Baird television outside programme hours will begin on September 30th, through London (2 LO), from 11 a.m. to 11.30 a.m. daily except Saturdays and Sundays. Neither the Postmaster-General nor the B.B.C. accepts responsibility for the quality of the transmission or the results obtained.

LOOKING BACKWARD.

FIFTY years ago, according to THE ELECTRICIAN *dated September 20th, 1879:*

The "New York Star" had an article denying that Mr. Edison had really invented anything in electric lighting.

A proposal to substitute electricity for the guillotine as a means of inflicting capital punishment was being discussed in France.

Electric lighting was used for a dance at Milford Haven. "Many of the ladies were apprehensive lest the intensity of the light might have an unpleasing effect. They were agreeably surprised to find that their fears were groundless."

* * *

TWENTY-FIVE years ago THE ELECTRICIAN *dated September 23rd, 1904, stated that:—*

Tenders for wiring a London infirmary ranged from £366 to £995.

The Electrical Contractors' Association was registered as an incorporated body.

* * *

FIFTEEN years ago it was stated in THE ELECTRICIAN *dated September 18th, 1914, that:—*

A census of electric vehicles in use in the U.S.A. gave a total of 3 810 "pleasure" cars, but only 223 commercial vehicles.

Communication by the Pacific cable was cut off by a German cruiser which appeared at Fanning Island under French colours, and took possession of the cable station.

Dublin Electricity Committee recommended salary increases for the city electrical engineer and the chief engineer of the distribution department on the understanding that the increases were not to take effect until after the war.

PERSONAL.

SIR Charles and Lady Parsons are expected to return to London from South Africa on September 23rd.

Examination results at Harris Institute, Preston, include, Electrical Engineering Course First year, Advanced Third position :—Frank Dakin.

Capt. P. P. Eckersley who resigned from the position of chief engineer to the B.B.C. last June has accepted a position with the Gramophone Co.

Mr. George A. Pirelli, managing director of Pirelli, Ltd., and chairman of Pirelli General Cable Works, Ltd., will sail tomorrow (September 21st) in the "Aquitania" for New York.

Bradford Education Committee recommends the appointment of Mr. E. M. Price, of Manchester, as lecturer in electrical engineering at the Technical College.

With reference to the paragraph on page 309 of our last issue, concerning Mr. H. J. Farrell, we are given to understand that he is Irish representative for Ferranti radio products only.

Richmond, Yorks, Town Council has appointed Mr. James B. Hood, of South Shields, as chief electrician in succession to Mr. W. L. Wickwar, who has become assistant chief electrical engineer at Bingley.

Bradford Electricity Committee has appointed Mr. William Dundas, resident engineer at Manchester Corporation's Barton power station, as deputy city electrical engineer, at a salary of £900 a year, rising to £1 000.

Mr. A. E. Vickery, foreman of the electrical branch at Devonport dockyard, has been appointed acting assistant electrical engineer in the department of the Director of Electrical Engineering at the Admiralty.

In accepting the resignation of Mr. H. P. Stokes, on his appointment as general manager of the United Automobile Services Co., Plymouth Tramways and Transport Committee offered him their congratulations and resolved to record their high appreciation of his valuable services.

Capt. R. C. Petter, a director of Petters, Ltd., left London last week on the Blue Star "Almeda Star," for Buenos Aires, from whence he intends to carry out a tour of South America with the object of studying trade conditions in that country.

Sir Ernest William Moir has accepted the invitation of the Council to become President of the Junior Institution of Engineers in succession to Lieut.-Col. J. I. C. Moore-Brabazon. His induction will take place at a meeting to be held at the Royal Society of Arts on December 13th.

Considerable gratification will be felt by their many friends in the electrical trade at the announcement, made this week by the General Electric Co., Ltd., that Mr. H. Wynne Roberts, sales manager of the company, and Mr. F. Winstanley, manager of the illuminating and domestic appliance departments, have been appointed directors of the company. Both Mr. Roberts and Mr. Winstanley joined the G.E.C. after leaving college, and have had some 30 years' service with the company, during which time they have gained experience which should be invaluable to the board. Mr. Roberts is personally acquainted probably with more electrical installation contractors than any other manufacturer's representative. He is a regular attendant at the E.D.A. Sales Conferences, where he can always be counted upon to say something stimulating and provocative. He has served on a number of trade committees and has represented the B.E.A.M.A. on the Registration Board of the National Register of Electrical Installation Contractors since its inception.

See page 343.

Obituary.

SIR JOHN MORICE AEMILIUS GATTI, on September 14th, aged 57 years. He was chairman of the London County Council in 1927-28 and received his knighthood last year. Apart from his association with the electrical industry as managing director of the Charing Cross Electricity Supply Co., Ltd., he was also a past President of the Electrical Development Association. Sir John was the son of Agostino Gatti, who came to London as a boy in the early 'fifties and with his brother Stefano acquired the old Adelaide Gallery in 1862, and turned it into a restaurant. He was educated at Stonyhurst and St. John's College, Oxford, and though called to the Bar at the Inner Temple at the age of 22, he did not practice, but turned his attention to the business of his father and uncle, to which he and his brother Rocco succeeded on the death of Agostino Gatti in 1896. In addition to restaurants the business included interests in the Adelphi and Vaudeville Theatres, an ice factory, and the Charing Cross Electricity Supply Co.

See page 343.

OVERSEAS TRADE.

Eight Months' Electrical Exports Exceed Imports by Nearly £8 000 000.

UNITED KINGDOM exports of electrical machinery, apparatus and material during August were valued at £1 678 755, representing an increase of £242 356 when compared with the same month last year. Similar exports for the eight months of this year amounted to £12 738 658, as against £12 224 888 for the corresponding period of 1928, the increase being £513 770.

Imports of electrical goods during August last were valued at £748 286, or £172 302 more than during August, 1928. Imports of similar goods for the eight months of the year amounted to £4 800 360, or £773 367 more than for the same period of last year.

An analysis of these figures shows that August exports were in excess of imports by £930 469, while for the eight months of this year the excess was £7 938 298.

Export items which showed improvement when compared with last year's return for the month of August include various motors and generators, other than railway and tramway machines, increase, £9 924; rubber insulated wires and cables, other than telegraph and telephone cables, increase, £36 723; and similar wires and cables, other than rubber insulated, increase, £36 862. Telegraph and telephone instruments, excluding wireless valves, also showed improvement, the increase being £87 494. On the import side, electrical machinery increased by £18 325, while telegraph and telephone instruments, excluding wireless valves, increased by £125 328.

The following are detailed figures :—

	Month of August.		Eight Months.

THE MANUFACTURE OF STORAGE BATTERIES.

Visit to the Works of the Chloride Electrical Storage Co.—Views on New Battery Inventions.

AT an informal luncheon preceding a visit last week to the works of the Chloride Electrical Storage Co., Ltd., at Clifton Junction, Mr. D. P. Dunne, sales manager and a director of the company, stated that there were frequent references in the lay press to new accumulators for which remarkable claims were made, but few of these batteries were ever heard of again. The company's attention had, during the course of a year, been drawn to several inventions which the inventors hoped would make their fortunes. Many were

A bay in the plate forming department at the "Exide" works.

old ideas rediscovered while others possessed no outstanding importance. Developments and improvements were constantly being made, but they were brought about by the laborious application of long experience and highly developed skill. There might be an epoch-making invention some day, and they were on the look out for it. The "Exide" Company was the largest accumulator-manufacturing concern in the British Empire, and one of the three largest in the world. The land occupied by the company had increased during the last four years by 40% and the covered part by 100 000 square feet.

The firm has developed a particularly effective ventilating system in the works, for the prevention of danger to the health of the workers from the presence of lead and lead oxide fumes and dust and with long experience, the company has, we understand, been able to give considerable assistance to the Ministry of Health in drawing up regulations.

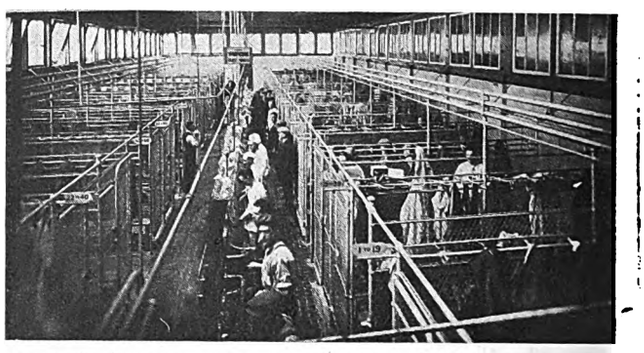
Four general types of batteries are made at Clifton Junction; "Chloride" and "Chloride Plante" batteries for stationary installations such as power stations, country house lighting plants, etc.; "Lux" batteries for lighting railway trains; "Exide" batteries for motor cars, wireless receivers, etc.; and "Exide-Ironclad" batteries which are used for the underwater propulsion of submarines, for land traction such as propelling electric vehicles, electric locomotives, trucks and cranes, and also for lighting motor buses and motor coaches. The first shop visited was the moulding department, where was seen in operation a press producing the lead tape used for banding and for rolling into the rosettes of Chloride R type plates. On the left of this process, sheet lead was rolled out and finely perforated to form an outer casement for box negative plates. Exide-Ironclad grids were being sheathed and trimmed, and cell connectors cast. Another casting operation seen was that of the spines which form the core of the tubes used for Exide-Ironclad positive plates. The pressure casting of box negatives is an interesting operation. The moulds are arranged around a circular cast iron pot containing molten antimonial lead and heated by gas burners. A thin sheet of finely perforated lead is placed in the mould and the two halves of the mould are brought together by hydraulic pressure; the molten metal is then forced into the closed mould by compressed air and the grid so formed is automatically attached to the sheet of perforated metal previously inserted. This forms one half of the box negative grid.

The casting of Exide grids, terminal posts and Plante plates were other casting operations to be seen in this department. The mechanics' shop was next visited, and here one half is devoted to repairs and maintenance jobs and in the other half are made the special moulds and tools used throughout the works. The first half includes a motor repair pit, electricians benches, acetylene burning equipment, and a blacksmith's shop. In the second half are electrically-driven planing machines, special rack-cutting machines, surface grinders, turning lathes, and milling machines working to 1 oooth part of an inch—all the apparatus for machinery and assembly of different parts of the moulds used in casting plate grids, and the making of assembly jigs for various parts of batteries. In the next shop the ebonite tube used in "Exide-Ironclad" plates are closely slitted by high speed precision machines—which were made on the premises—and the tubes are then threaded on to the metal spines. The metal buffers for Plante cells are also made here.

The next process is the filling of Exide-Ironclad tubes with red lead, which forms the active material. The red lead powder is inserted by shaking machines, after which the bottom and top bars are burnt up. In the pasting department lead oxides are applied to the grids in the form of paste, either by machines or by hand. In the case of box negatives a template is placed on one half of the grid and the paste is pressed in with a paddle. The template is then removed and the other half of the grid placed in position, after which machines press and rivet the two halves together. Finally the edges are trimmed and the plates are dried in ovens.

Above this shop are two floors. A barrel elevator raises the heavy drums of red lead from the makers' lorries to the top floor where they are tipped by special tipping gear into a dry mixer on the intermediate floor. From this it is transferred by an enclosed spiral conveyor to the red lead shaking machines which fill the Exide-Ironclad tubes on the ground floor. Similar airtight mixing machines on the intermediate floor churn and deliver the dry oxide powder to the ground floor where liquid is added to make the paste.

In the plate stores the plates are cut and sawn behind glass screens so that in effect the workman and the job are in separate rooms. An exhaust settling chamber is at the rear of the machines, and the air speed through the opening below the glass screen is 100 ft. per min. As a further preventitive of lead dust in the air, the floors are kept thoroughly wet.



One of the cloakrooms provided for the workmen. Note the washing arrangements along the aisle.

In the test house attached to the works, is carried out research work and capacity and continuous life tests on batteries. In the chemical laboratory raw materials, acids and waters are tested and chemical tests are conducted. Innumerable inventions are submitted to the company, and life tests, breakdown tests, developments and the investigation of new ideas and suggestions are in continual progress.

The elaborate precautions against lead dust in the works have already been noted. All these safeguards are under the meticulous supervision of a resident doctor who was appointed by the company at the end of 1927 to devote the whole of his time to the study of lead poisoning. The entire system is aided by blood examinations conducted periodically, by means of which any increase in the amount of lead absorption in the blood is detected immediately, long before there is any symptom or sign of trouble in the worker. In this way any defective process on which a man is employed is at once discovered, overhauled and effective measures adopted before lead poisoning has had the opportunity to develop. These preventitive measures have proved so efficient that since the end of 1927 there have been no cases of lead poisoning at the Exide works.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, where available.

SOUTHEND-ON-SEA CORPORATION.—Supply of 1 500 current limiters. Further particulars from Mr. A. C. Johnson, acting borough electrical engineer, Electricity Works, London Road, Southend-on-Sea.

CLITHEROE CONSERVATIVE CLUB, September 20th.—Electric wiring. Specifications from Messrs. A. R. Gradwell and Sons, 25, Victoria Street, Blackburn, until September 20th.

DEVON MENTAL HOSPITAL, EXMINSTER, September 20th.—Six months' supply of electric lamps, etc. Tender forms from the clerk, Mr. Cecil Masters.

NORTHERN IRELAND MINISTRY OF FINANCE, September 20th.—Electric light installation at the Custom House, Londonderry. Specifications can be seen and forms of tender obtained at the Custom House, Londonderry, and at the offices of the Ministry, 15, Donegall Square West, Belfast.

Lighting Installations.

WADDINGTON HOSPITAL TRUST, September 20th.—Work in connection with electric lighting of almshouses, vicarage, Reader's Old House, Lower Buck Inn and Carter Fold Farm, Waddington, near Clitheroe. Specifications can be seen at the almshouses.

WARRINGTON GUARDIANS, September 21st.—Twelve months' electrical supplies to Whitecross Institution, Warrington, or Cottage Homes, Padgate. Tenders (separate for the two places), to Mr. Arthur Bottomley, clerk, Union Offices, Museum Street, Warrington.

COUNTY OF LANARK MIDDLE WARD DISTRICT COMMITTEE, September 23rd.—Electric lighting work in connection with erection of new bathroom, etc., at County Convalescent Home, Calderbank House, near Baillieston. Intending offerers are asked to communicate with Mr. P. C. Smith, District Offices, Hamilton, on or before September 23rd.

SALFORD CORPORATION, September 23rd.—Supply of 10 000 kVA, 33 kV/6·6 kV transformers for outdoor service. Specification from the City Electrical Engineer.

COMMISSIONERS OF H.M. WORKS, ETC., September 24th.—Steam generating set, control panel and modification of existing electric generator, at the State Institution, Rampton, Retford. Specifications, etc., from the Contracts Branch, H.M. Office of Works, King Charles Street, London, S.W.1; deposit £1 1s.

GRIMSBY CORPORATION, September 24th.—Electrical installation in new school at Nunsthorp. Specification from Mr. S. R. Windle, borough electrical engineer, Grimsby.

MERSEY RAILWAY CO., September 24th.—Electrical sundries, lamps and fittings. Forms of tender from Mr. J. Shaw, general manager and secretary, Central Station, Birkenhead.

DEVIZES RURAL DISTRICT COUNCIL, September 25th.—Electric light installation in houses at Easterton, Great Cheverell, Market Lavington, West Lavington, and Worton. Particulars from the clerk, Mr. P. R. Trapp, Maryport Chambers, Devizes.

STAFFORD COUNTY EDUCATION AUTHORITY, September 26th.—Electric light and power installation in new wing of Wolverhampton Grammar School. Specification, etc., from Messrs. Moffett, Rosher and Mann, Union Chambers, Temple Row, Birmingham; deposit £3 3s.

EAST LOTHIAN EDUCATION AUTHORITY, September 27th.—Electrical work in connection with erection of public schools at Longniddry and Aberlady. Forms of tender, etc., from Messrs. Morham and Brotchie, 29, Hanover Street, Edinburgh.

HORSHAM URBAN DISTRICT COUNCIL, September 27th.—Supply and erection of (*a*) rotary convertor, 125 kW step-up transformer, two draw-out truck type e.h.t. switch units; (*b*) sub-station equipment: two 100 kVA transformers, e.h.t. switchgear, l.t. switchboard and cable works; (*c*) one e.h.t. feeder cable, laid complete. Specification, with form of tender, drawings, etc., from the electrical engineer, Mr. F. Ffrench, Electricity Works, Horsham, deposit £3 3s. (or £1 1s. for any one section).

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, September 27th.—Supply and erection of a double circuit, 33 000 V, three-phase, 50 cycle, overhead (steel towers) transmission line. Specification (No. 33/T/1), from Mr. E. F. Hetherington, chief engineer and manager, at the offices of the Authority, Phœnix Buildings, Dudley Road, Wolverhampton; deposit £1 1s.

EDINBURGH CORPORATION, September 28th.—Electric light installations in 48 houses at Quarryholes and 24 at Sunnybank. Specification, etc., from the Engineer, Electricity Works, Dewar Place, Edinburgh.

MIDLOTHIAN AND PEEBLES DISTRICT ASYLUM, ROSSLYNLEE, September 28th.—Six months' supply of electrical fittings, etc. Forms of tender from the clerk and treasurer, Mr. C. L. Addison Smith, 19, Heriot Row, Edinburgh.

WARRINGTON CORPORATION, September 28th.—Electrical gear in connection with pumping plant for river filtration works. Specification from Mr. J. Gray, Water Engineer's Offices, Warrington; deposit £1 1s.

METROPOLITAN ASYLUMS BOARD, October 2nd.—Installation of electric bells at Paddington Casual Ward (Contract No. 6): new storage battery for t.s. "Exmouth" (No. 7); and alterations to electric lighting in "X" block at Eastern Fever Hospital (No. 8). Specifications from the Board's Office, Victoria Embankment, E.C.4; deposit £1 for each.

HASTINGS CORPORATION, October 3rd.—Supply of (*a*) 11 kV metal clad switchgear; and (*b*) one 5 000 kVA outdoor type transformer. Specifications from Mr. A. J. Ryan, borough electrical engineer, 12, York Buildings, Hastings; deposit £1 1s. for each contract.

GRIMSBY CORPORATION, October 4th.—One year's supply (about 25 000 yds.) of paper insulated, lead covered, low pressure cables. Specification (No. 269) from Mr. S. R. Windle, borough electrical engineer, Electricity Works, Grimsby.

HALIFAX CORPORATION, October 7th.—Electricians' work in connection with erection of filter house, etc., for the waterworks department. Specifications, etc., from the Borough Engineer; deposit £2 2s.

GREAT WESTERN RAILWAY CO., October 8th—October 25th.—Supply of telegraph instruments (list 18); electrical apparatus (insulators, etc.) (19); electric wires and cables (20); electric lamps (24), etc. Samples and patterns may be seen from September 23rd to 27th at the office of the Stores Superintendent, Swindon, where specifications and forms of tender can be obtained. Form of tender for list 20 will be issued on October 17th. Tenders for list 20 by October 25th and for other above-mentioned lists by October 8th.

HACKNEY (LONDON) BOROUGH COUNCIL, October 9th.—One 30 000 kW C.M.R. turbo-alternator and exciter, etc. Specifications from the Borough Electrical Engineer, 18–24, Lower Clapton Road, E.5; deposit £30.

HACKNEY (LONDON) BOROUGH COUNCIL, October 9th.—Fourteen 6 600 V, three-phase, metal clad, oil circuit breaker equipments, each not less than 1 000 000 V rupturing capacity; remote electrically-controlled duplicate busbars; cabling and auxiliary gear controlling one 30 000 kW turbo-alternator, two 30 000 kVA transformers, two 15 000 kW reactance links, one 30 000 kVA busbar coupler equipment, with and without reactance, and six 8 000 kW feeders. Specifications from the Borough Electrical Engineer, 18–24, Lower Clapton Road, E.5; deposit £3.

SOUTHWARK (LONDON) BOROUGH COUNCIL, October 22nd.—Twelve months' supply of electric cables. Further particulars from the Electrical Engineer, Penrose Street, Walworth Road, London, S.E.17.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

IRISH FREE STATE COMMISSIONERS OF PUBLIC WORKS, September 20th.—Two electric lifts at the Stationery Office (Beggar's Bush Barracks), Dublin. Specification from the Office of Public Works, Dublin; deposit £1.

SOUTH INDIAN RAILWAY CO., LTD., September 20th.—Supply of electric goods, locomotives and battery tenders, in connection with electrification of Madras suburban services. Specifications, etc. (£1), from the Company's offices, 91, Petty France, Westminster, S.W.1.

Digitized by Google

South Indian Railway Co., Ltd., September 20th.—Electrical control and traction equipment for suburban services. Specifications, etc. (£1, not returnable), from the Company's Offices, 91, Petty France, Westminster, S.W.1.

Auckland Electric Power Board, September 23rd.—Supply of pilot cable and joint boxes. (Reference B. X. 5 643.)

Dublin Borough Commissioners, September 23rd.—Wiring 421 houses in Donnycarney housing area, for electric lighting and heating. Specifications, etc., from City Treasurer, Exchange Buildings, Lord Edward Street, Dublin; deposit £1 1s.

Egyptian Ministry of the Interior, September 23rd.—Electric light installation and distribution system for the town of Kafr-el-Cheikh (Gharbieh Province). Reference B.X. 5 502.)

Invercargill (N.Z.) Corporation, September 23rd.—Supply and delivery of switchboard to be directly operated and suitable for controlling 11 000 V, three-phase, 50-cycle current. It may be either of the draw-out truck type or totally armour clad, and will at first consist of seven units. (Reference B.X. 5 507.)

South African Railways and Harbours, September 23rd.—Crude oil engine-driven 150 kW electric generating plant. (Tender No. 1 528.) (Reference B.X. 5 566.)

India Store Department, September 24th.—Supply of 31 000 yards of dry core electric cable. Schedule (No. 4) (5s.) from the Director-General, Belvedere Road, London, S.E.1.

Postmaster-General's Department, Melbourne, September 24th.—Supply of condensers (schedule C. 461) (Reference B.X. 5 488.)

India Store Department, September 25th.—Supply of 200 000 porcelain and composition telegraph insulators. Schedule (No. 3) and form of tender (5s.) from the Director-General, Belvedere Road, London, S.E.1.

Melbourne and Metropolitan Tramways Board, September 25th.—Insulated and bare copper cable (contract 723). (Reference B.X. 5 654.)

South African Railways and Harbours, September 26th.—Two 100 kVA motor alternators (tender No. 1 521). (Reference B.X. 5 564.)

Victorian Electricity Commission, September 30th.—Supply of 48 busbar-supporting insulators, for use on three-phase, 50 cycle transmission system, 66 000 V between phases (specification 29/120). (Reference B.X. 5 686.)

New Zealand Posts and Telegraphs, October 7th.—Supply of 70 000 small galvanised steel insulator bolts (tender No. 151/1 806). (Reference B.X. 5 681.)

Egyptian Ministry of the Interior, October 15th (extension of time).—Erection and equipment of electric power station (about 500 kVA), with overhead and underground networks, for the town of Menouf. (Reference B. 5 674.)

South African Railways and Harbours, October 17th.—One 10-ton electric overhead travelling crane (tender No. 1 533). (Reference A.X. 8 463.)

Wellington Corporation, October 21st.—High and low tension switchgear (contract No. 449). Reference B.X. 5 649.)

Postmaster-General's Department, Melbourne, October 22nd.—Supply of insulated wire (schedule C. 475). (Reference B.X. 5 580.)

Postmaster-General's Department, Melbourne, October 22nd.—Telephone transformers (schedule C. 474). (Reference B.X. 5 581.)

Telephone Cable.

Victorian Railway Commission, October 23rd.—Dry-core telephone cable (contract No. 43 384). (Reference B.X. 5 638.)

Melbourne City Council, October 30th.—Two 2 500 kW motor-converters and accessories, or two 2 500 kW rotary converters, with transformers and accessories. (Reference B.X. 5 570.)

New Zealand Posts and Telegraphs, October 30th.—Head receivers (P. and T. 151/1 725). (Reference B.X. 5 603.)

Johannesburg Municipality, October 31st.—Steel tramway rails, fishplates, manganese points, etc. (contract No. 257). (Reference A.X. 8 523.)

South African Posts and Telegraphs, November 14th.—Supply of 400 000 lb. of hard drawn copper wire, 2 000 lb. of soft drawn copper wire and 2 000 lb. of soft drawn, tinned copper wire (tender No. 173). (Reference A.X. 8 510.)

Postmaster-General's Department, Melbourne, November 19th.—Supply of telephone generators and motor generators (schedule No. C. 479). (Reference B.X. 5 662.)

Western Australia Government, November 29th.—Supply and erection at Perth of (*a*) boiler house equipment, and (*b*) 12 500 kW turbo-generator and condensing plant. Specifications (£1 1s. for each; not returnable) from the Agent-General, Savoy House, Strand, London, W.C.2.

Victorian Electricity Commission, November 25th.—Switchgear, for Yallourn power station (specification No. 29/103). (Reference B.X. 5 636.)

Victorian Electricity Commission, November 25th.—Watt-hour meters, recording instruments and remote, metering equipment, for Metropolitan terminal stations and sub-stations (specification No. 29/92.) (Reference B.X. 5 614.)

Indian Stores Department, December 3rd.—Ceiling and table fans. (Reference B.X. 5 672.)

Argentine National Sanitation Works Department, December 9th.—Supply of 8 electrically driven centrifugal pumping sets, 3 air compressor sets and 20 centrifugal exhausters. (Reference A.X. 8 509.)

New Zealand Public Works Department, December 10th.—Three single-phase, oil insulated, water-cooled transformers, with accessories (section 295). (Reference B.X. 5 600.)

Tenders Accepted.

Dunoon Council.—Johnson and Phillips, Ltd., complete electric lighting scheme.

Sandbach Grammar School.—Carrington and Button, electric light installation.

Glasgow Corporation.—Malcolm and Allan, electric lighting at Kinning Park Hall.

Farnworth Urban District Council.—E. E. Garrard and A.C.E.C., supply of l.t. cables.

Southern Railway.—Twelve months' supply of Osram gasfilled and vacuum lamps and Osram train lighting lamps.

Luton Corporation.—Brush Electrical Engineering Co., Ltd., construction of covered tops for three tramcars, £355 each.

Southern Railway Co.—Johnson and Phillips, Ltd., high tension cables for Dartford, Gravesend and Twickenham-Windsor sections.

Auckland Power Board.—Johnson and Phillips, Ltd., about 13 miles of 22 000 V, 0·25 three-core cable, for underground transmission line.

Guildford Corporation.—Wilmot and Son, wireless installation at the infirmary, with 48 pairs of headphones and plugs in 12 wards, £69 1s.

Metropolitan Water Board.—Barlow Bros. and Co., provision of Parsons-Sloper secret interphones, etc., at head offices, £270. (Recommended.)

Sittingbourne U.D.C.—Kent Electric Power Co., Ltd., installing electric light in houses, providing seven points, globes and pendants, at £4 per house.

Ammanford Urban District Council.—D. O. Williams and Co., erection of supply line from Ammanford boundary to Mountain Colliery, Bettws, £195.

Ripley Urban District Council.—Derbyshire and Nottinghamshire Electric Power Co., public lighting, £3 15s. each for 19 lamps, and £4 each for 26 lamps.

Maidstone Education Committee.—Oswald Jones and Co., electric light installation at Union Street Schools, £137. Corporation Electricity Department withdrew its original tender, £121 14s. 5d., and submitted a revised one, £90.

Reigate Corporation.—Manlove, Alliott and Co., Ltd., refuse destructor, including electrical plant, etc., £11 526. Other tenderers: John Crewdson, £9 770 3s. 11d.; Mr. A. E. Farr, £10 538 7s.; Heenan and Froude, Ltd., £13 164.

India Stores Department.—General Electric Co. (India) Ltd., equipment for rotary convertor, etc., Rs. 1 900, switchboard, etc., Rs. 1 950, cable work, etc., Rs. 2 010, spare parts, Rs. 495; Stewarts and Lloyds, Ltd., Victaulic fittings, Rs. 16 194.

Southend Corporation.—W. T. Henley's Telegraph Works Co., Ltd., 12 section fuse pillars in connection with change over, £448 16s; Fraser and Chalmers, Ltd., 1 700 B.H.P. Diesel engine, coupled to 1 200 kW d.c. generator, and switchgear, £21 000.

Cape Town Corporation.—Albert Vaux, Ltd., installation of electric cooking apparatus and water heating plant at Mizenberg Pavilion restaurants, £520. Ironclad service cut-

Digitized by Google

outs, British Insulated Cables, Ltd., £510 10s., and Siemens Bros. and Co., Ltd., £69; copper wire, Associated Engineers Co., Ltd., £2 049, and Albert Vaux, Ltd., £115; 97 electric light poles, British Insulated Cables (S.A.), Ltd., £570 4s. 3d.

BRIGHTON GUARDIANS.—Adams Bros. and Broadbridge, Ltd., supply and fitting of electric light equipment in Nurses' Home, Poor Law Infirmary, Pankhurst Avenue, Brighton, £123. Also tendered: General Installation Co., Ltd., £130; Gooding and Sons, £130; W. A. Rood, Ltd., £132; J. G. Marchant and Martin, £150; C. Lewery, £135; Page and Miles, Ltd., £140; H. J. Galliers, £161; E. E. Fellingham, £177; G. Mitchell, £147.

LEEK URBAN DISTRICT COUNCIL.—Overhead, Ltd., overhead electric mains to supply premises at Longsdon, £1 858).

LONDON COUNTY COUNCIL.—Coleby and Co., wiring and fittings for electric lighting, power and bells in the extension of the L.C.C. Trade School for Girls, Bloomsbury, £337. Also tendered: A. Dean and Co., Ltd., £341; Malcolm and Allan (London), Ltd., £344; Electric Installations, Ltd., £382; H. J. Cash and Co., Ltd., £398; Pinching and Walton, £443.

GLASGOW CORPORATION.—T. B. and J. A. Mathieson, Ltd., electrical work at new baths at Plantation; John Deas and Co., electric crane at Shettleston baths, £99 10s.; Fraser and Borthwick, Ltd., battery charging plant, £19 443 5s. 9d., and overhead charging feeder system for garage at Govan, £349 3s. 8d.; electrical installations at housing estates: Shettleston and Tollcross, £396 8s. 4d., Saracen Street, £809 4s., and Quarrybrae Street, £1 355 8s. 8d., R. J. M'Intyre; Altyre Street, £651 19s. 2d., David Henderson (all recommended).

CENTRAL ELECTRICITY BOARD.—Contracts, amounting, approximately, to £808 000, for work in connection with the undermentioned schemes: South-East England, British Insulated Cables, Ltd., 33 kV and other cables; A. Reyrolle and Co., Ltd., 33 kV and lower voltage switchgear; Mid-East England, General Electric Co., Ltd., 132 kV overhead transmission lines. The erection work under the last-mentioned contract will be carried out by the Pirelli-General Cable Works, Ltd. The contract, which amounts to £494 836, covers the supply and erection of 320 miles of 132 kV lines, identical in construction with the overhead lines which the General Electric Co., Ltd., and the Pirelli-General Co. are now erecting for the Board in South-East England.

CONTRACTORS' YEAR BOOK.

Interesting Details of the Scottish Association's Work and Progress

THE Year Book and Diary of the Electrical Contractors' Association of Scotland for 1929-1930 is to hand. It contains portraits of Mr. J. Johnston Foggo, president, Mr. D. H. Morris, vice-president, Mr. Walter Finlay, secretary, Messrs. Thos. Rigg, Alex. Pratt, John Smith and J. L. Anderson, chairmen of the Glasgow, Edinburgh, Dundee and Aberdeen branches, respectively, and Mr. James M. Davies, auditor and formerly secretary of the Association; lists of members and of firms represented; particulars of the development of the Association and its objects and scope; an illustrated report of the annual meeting at Barrhead, Glasgow, in June last; model conditions of tender; a form of apprentices' indenture and discharge certificate, a list of Scottish electricity supply undertakings, giving names of owners, chief or resident engineers, voltage, etc., of supply, and prices charged; the Central Scotland Electricity Scheme and maps of the area covered by the scheme and of the areas of existing undertakings in and around Edinburgh and Glasgow; regulations for entering into and carrying out building contracts; preliminary rules applicable to all trades; mode of measurement of electrical work; special rates for workmen's compensation and third party insurance; a list of Scottish contractors on the National Register; a geographical directory of architects; officials and fellows of the Faculty of Surveyors of Scotland; members of the Cable Makers' Association, the Accumulator Makers' Association and the Electric Lamp Manufacturers' Association; a list of British Standard Specifications; information regarding power required to drive machinery and oncost charges. The book, which is published by the Association at 55, Frederick Street, Edinburgh, at 3s. (3s. 6d. post free), is well printed on good paper and well bound, and it contains, in addition to the above-mentioned features, a large diary with only two days on a page, giving ample space for entries. Those engaged in the electrical industry will find the book very good value for money.

BUSINESS ITEMS.

MESSRS. A. W. BEUTELL, LTD., 96, Victoria Street, London, S.W.1, have made an all-round reduction in the prices of "Linolite" strip reflectors.

The GENERAL ELECTRIC CO., LTD., ask us to state that the Henry Tattersall who was convicted at the Hull Police Court on August 26th for selling spurious Osram lamps, was in no way connected with the firm of Henry Tattersall, Ltd., of Spotland Bridge, Rochdale.

With reference to our review last week of the exhibits of WILD BARFIELD ELECTRIC FURNACES, LTD., at the Shipping, Engineering and Machinery Exhibition, the address of this firm is Elecfurn Works, North Road, London, N.7, and not Harrow Road, as mentioned.

With reference to the advertisement of W. T. Henley's Telegraph Works Co., Ltd., which appeared on page xxx of our last issue, it should be noted that the bottom line of the letterpress should read: "reasons why Henley Unit Pillars are worth more," this line being a repetition of the substance forming the basis of the advertisement.

Mr. A. J. Cunningham has commenced business on his own account, trading as Cunningham Beard and Co., of 146, Kensington High Street, W.8. as electrical and radio engineers, and manufacturers of decorative fittings for cinemas. He would like to receive catalogues from manufacturers. Recent orders received include two from Blackpool Corporation for over 1 000 lamp shades, decorative fittings for the "Astoria" cinema, Dundee, and also special fittings for the Trust Houses.

The telephone number of the RELIANCE TELEPHONE CO., LTD., Goschen Buildings, Henrietta Street, London, W.C.2, has been changed to Temple Bar 1010. Other changes in the London telephone area are THE RELAY AUTOMATIC TELEPHONE CO., LTD., Marconi House, Strand, W.C., Temple Bar 1117; the ELECTRICAL EQUIPMENT AND CARBON CO., LTD., 107-111, New Oxford Street, W.C., Temple Bar 7058/9; A-S REFRIGERATING MACHINES, LTD., Magnet House, Kingsway, W.C., Temple Bar 8000.

The FALKIRK, GRANGEMOUTH AND EAST STIRLINGSHIRE PUBLICITY AND DEVELOPMENT ASSOCIATION has been formed, with Mr. James Taylor as organising secretary, and with offices at Cow Wynd, Falkirk. A strong working committee of iron founders and representatives from Grangemouth has been appointed, and a publicity campaign is being organised to make known the attractions of Falkirk and district (which, it is claimed, is the centre of the light castings trade of the country) as a suitable district in which to manufacture.

Mr. A. E. Pollard, H.M. Trade Commissioner at Vancouver, is now in this country on an official visit, and will be in attendance at the offices of the Department of Overseas Trade until September 27th, when he will be prepared to interview representatives of firms interested in the export of British goods to Canada. He will subsequently visit a number of commercial centres in the Provinces. Applications for interviews with Mr. Pollard in London should be made at once to the Comptroller-General, Department of Overseas Trade. (Reference No. 13812/1/29.)

GEO. H. SCHOLES AND CO., LTD., of Manchester, are to be congratulated on the electrical installation which they have just completed at the new synagogue in Bury Old Road, Manchester. The work has been carried out to the specification of Messrs. Pendleton and Dickinson, architects, of Manchester. One of the features of the work is the coloured lighting, red, blue and yellow, which has been arranged by means of concealed lights in the dome above the Ark. By this means appropriate lighting effects may be obtained over the Ark and the reading desk. In the centre of the building where the congregation sits there are lights both in the ceiling and hanging, arranged in the form of a Cross of David and further adding to the effect obtained.

MICA STEALING IN INDIA.

The Legislative Council of Bihar has referred the Mica Bill to a select Committee. In Bihar and Orissa the problem in regard to mica is similar to that which arose in South Africa in connection with illicit diamond buying. The exports of mica are double the quantity accounted for by regular mining, and the surplus is due to the fact that large quantities are stolen and sold cheaply to dealers. All the large mining companies have lost money, although the deposits in Bihar of this material, which is so largely used in electrical work, are the biggest in the world. The Bill will compel dealers to declare the source of their purchases.

ELECTRICITY SUPPLY.

Shoreditch Free Wiring—Porthcawl Supply Scheme—Birkenhead Assisted Wiring—Denmark's Imported Electrical Energy—The Central Board and the Lake District—Low Temperature Heating in the City of London.

PLYMOUTH Electricity Committee recommends an expenditure of £20 000 on mains and conduits.

South Shields Electricity Committee has obtained sanction for a loan of £5 000 for the assisted wiring scheme.

Stokesley and Great Ayton are shortly to be supplied with electricity by the Newcastle-upon-Tyne Electric Supply Co.

Dartford electricity department is to extend the cable in York Road, at a cost of £240, for giving a supply to the "Ivy Leaf" public-house, Brent.

Work in connection with the erection of cable for supplying the portion of the village of Fairlie in the parish of Largs has been commenced by the Ayrshire Electricity Board.

Application is being made to the Electricity Commissioners by the Nelson T.C. for approval to the terms of a draft agreement with Burnley Corporation for the provision and laying of an inter-connecting main.

Shoreditch (London) Electricity Committee reports that applications for supplies are being received at the rate of over 60 per week, and it has been decided to seek sanction for a further loan of £20 000 for the free wiring system.

It is stated that Barnoldswick will have its supply of electricity in a week or so. Mr. R. Blackmore, the Council's consulting engineer, states that the undertaking will be a paying proposition when it has between 300 and 400 consumers.

Porthcawl Council last week further discussed the electricity scheme and, on the advice of Mr. Arthur Ellis, decided to request a representative of the two approved tenderers to attend separately and discuss their tenders in detail with the Council.

The Central Electricity Board has quoted terms for the supply of electricity to the Skelmorlie Co. for use at Inverkip and Wemyss Bay, and the company has accepted the terms subject to the authority to supply at those places being transferred from Greenock Corporation to the company.

Torquay Corporation has decided to retain Mr. W. M. Selvey to act as consulting engineer in connection with the development of electricity supply in the area to the south and west.—Application is to be made for an Order to supply in Ivybridge urban and parts of Kingsbridge and Totnes rural districts.

Birkenhead Electricity Committee is making good progress with its assisted wiring scheme, and it is intended to introduce this in all parts of the town. The number of lights which will be installed under this scheme is limited to a maximum of five per house. An electric iron with plug and socket will also be provided.

The demand for electricity in Denmark, especially in the big towns of Zealand, is so great that Denmark is going to draw still further supplies from Sweden. A new cable is being laid under the narrow Oeresund between the two countries. In Denmark windmills are generally largely used for generating electricity, but these cannot so well be used in the towns. Practically every hamlet and every cottage in that country uses electricity for domestic purposes as well as for general lighting.

It is stated that the first big section of the new electricity generating station at Red Cote, Kirkstall, for Leeds Corporation will be completed within the next few months. The ultimate cost of the scheme is estimated at about £2 000 000. The works should be in operation early in 1930. The Central Electricity Board is expected to be in a position to adopt the scheme for the North-East section by the second week in October, and the contracts for the overhead lines of the Mid-East England scheme were placed this week.

Eastbourne Corporation is to lodge an objection to the proposed application by Messrs. Johnson and Phillips, Ltd., for powers to supply Ringmer and the district comprised in the Eastbourne Electricity (Extension) Order. The T.C. is applying for an Order to authorise supply of electricity to specific premises in the parishes of Eastdean and Friston in Eastbourne rural district. The consulting engineer, Mr. W. C. C. Hawtayne, is to prepare an estimate of the additional cost which would be incurred by placing part of the line underground and the Electricity Committee has decided that, provided the additional cost will not affect the charges for supply already approved, it is prepared to agree to the placing underground the section of line in question.

Sir Andrew Duncan, chairman of the Central Electricity Board, with Mr. Archibald Page and Mr. Blackmore, conferred with the chairman and secretary of the National Trust and Sir John Randles, chairman of the Keswick Committee, on September 12th on the question of the erection of overhead electric lines in Northern Lakeland. They visited the Lorton-Bassenthwaite and Keswick Valleys from Lorton to Troutbeck, in which area the Keswick Committee asked that about 18 miles of cables should be placed underground. At a meeting of Keswick Council on September 13th Sir John Randles announced that the Central Electricity Board had agreed to put the essential parts underground.

Carlisle Electricity Committee has obtained sanction to borrow £2 400 for mains and £240 for purchase and adaptation of property. The Committee is to seek sanction for area extensions to villages in the rural districts of Brampton and Longtown.—In connection with the North-East England electricity scheme, the Electricity Committee has decided that having regard to the large expenditure involved in the proposed standardisation of frequency, representation be made to the Board protesting against the outlay for the purpose mentioned on the grounds that the benefit obtained from such standardisation is more local than national in its application.—The Committee has instructed the City Electrical Engineer to accept, in conjunction with the Central Electricity Board, a tender for the supply of switchgear at the new electricity works.

Sheffield electricity department has been unable to get into direct contact with colliery companies in the district, in regard to purchase of coal, as practically the whole of the output is sold through agents. When the Corporation invited tenders for 12 months' supply of coal to the department, not one colliery company replied, the whole of the inquiries being received from agents. A sub-committee recommends that the Corporation should submit to the Government Committee which is considering the conditions relating to the sale of coal, the desirability of ascertaining whether the absence of agents would enable colliery companies to supply their product more cheaply and the desirability and practicability of empowering municipalities to become agents for supplies of coal for their own requirements.

The City of London Electric Lighting Co., Ltd., has issued a pamphlet giving brief particulars of electric low-temperature heating for which electrical energy is supplied at ½d. per kWh between 7 p.m. and 10 a.m., and ¾d. per kWh between 10 a.m. and 7 p.m. Consumers are invited to avail themselves of the company's offer to inspect their premises, and submit free of charge details of a suitable installation together with an estimate of costs. It is claimed that the loading of the company's low temperature electric convectors to maintain an internal temperature of 60 deg. F. is less than half that required when luminous radiators are employed. The heating elements are enclosed, and as the convectors work at a temperature not exceeding 200 deg. F., they can be left in operation all night without risk. It is stated that the temperature of a room of 1 500 cub. ft. capacity can be maintained overnight by a 500 W convector, costing ½d. per hour.

According to Dominion Bureau statistics, the average daily output of central electric stations in Canada in June was almost 11% higher than the corresponding average last year. The average daily output in June, 1929, was 45 906 000 kWh, compared with 41 411 000 in June, 1928. The aggregate production of central electric stations in Canada during the first six months of 1929 was 8 567 141 000 kWh or 10·6 % more than the figure for the first half of 1928. In the Maritime Provinces during the six months, electricity developed by water power reached a total of 90 199 000 kWh, against 60 947 000 during the same period in 1928. In Quebec the output of 4 161 511 000 kWh compares with 3 638 584; in Ontario, 3 004 771 000 compares with 2 875 128 000 000; in the Prairie Provinces, 612 722 000 against 551 030 000; and in British Columbia, 535 189 000 against 517 217 000. The quantity of electricity generated by water power in central electric stations during the first half of the current year was 8 404 424 000 kWh, or over 98 % of the aggregate output.

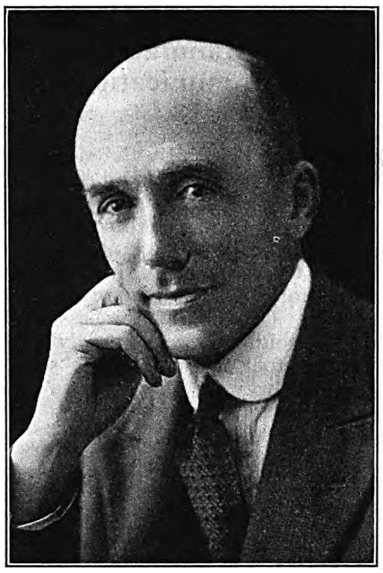
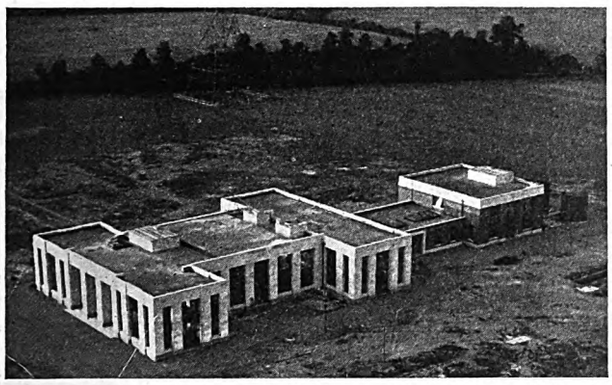
ELECTRICAL NEWS OF THE WEEK IN PICTURES.

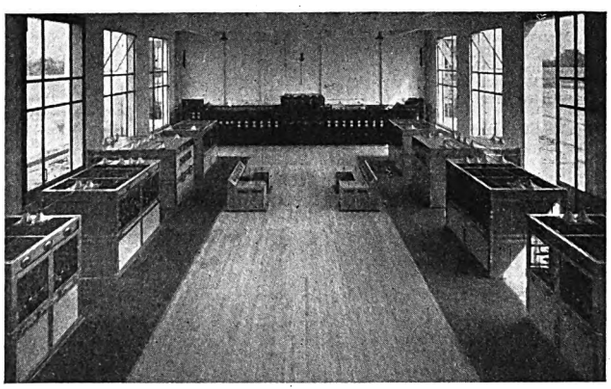
Mr. F. Winstanley, manager of the illuminating and domestic appliance departments, now appointed a director of the G.E.C. See page 337.

Sir J. M. Gatti, managing director of the Charing Cross Electricity Supply Co., whose death is referred to on page 337.

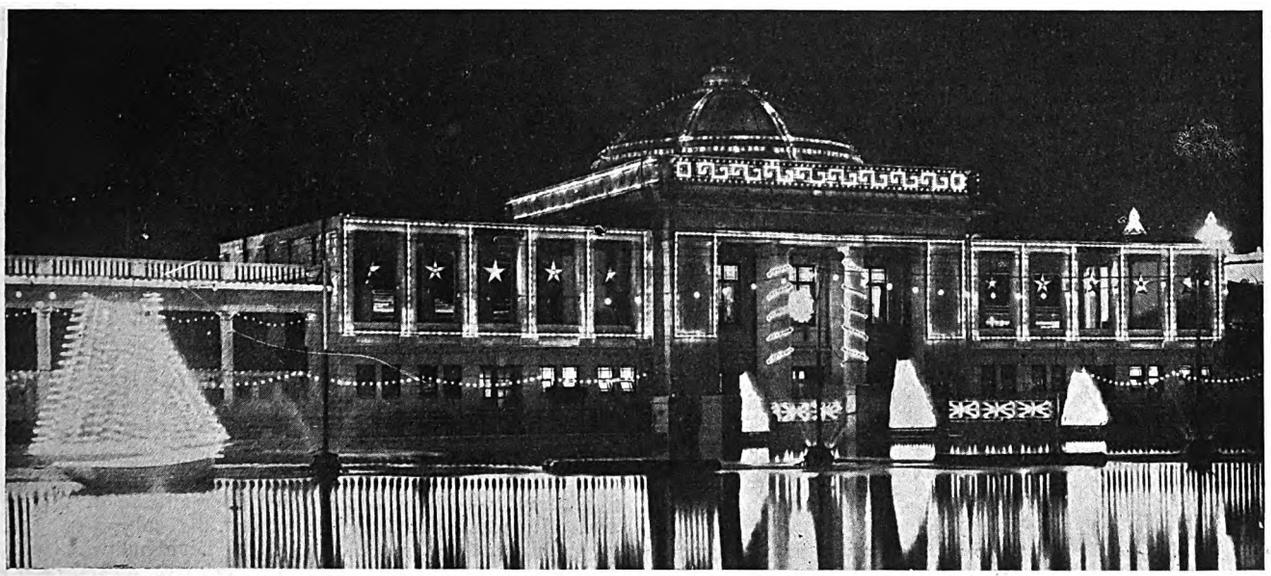


Mr. H. W. Roberts, sales manager of the General Electric Co., Ltd., who, as announced on page 337, has also been elected to the Board of the company.





These views of the Brookman's Park station of the B.B.C. show, left, an aerial view of the station, and right, the main transmitting hall with the controls for the two transmitters in the centre. This station started its experimental transmissions on Monday, and, according to reports, the results are, in the main, satisfactory. A description of the station and an explanation of the arrangement of the aerial-earth system are given on page 329.



The first section of the Blackpool autumn illuminations was inaugurated on August 6th, when 12 000 electric lamps were switched on at the open air baths. The scheme has been executed under the superintendence of Mr. C. Furness, borough electrical engineer, and Mr. F. W. Field, resident engineer. The illuminations will be continued every night, and to-morrow, Saturday, when effect will be given to the full scheme, about 100 000 lamps will be in use. At the open air baths there are eight flashing kaleidoscopes, the dome above the entrance hall and all the main buildings are outlined in light, and an illuminated yacht seen in the above picture rides at anchor in the lake.

COMPANY NEWS.

Electrical Manufacturing Descriptions Mainly Firm—Metropolitan Supply Shares Improve —Communication Holdings Higher—Traction Stocks Decline—Company Reports, Dividends and Meetings.

BUYING of British Insulated and Callender's Cable ordinary shares has raised the quotations from last week's figure of 75s. in each case, to 77s. 6d. and 78s. 9d. respectively at the time of writing. Brush Electrical ordinary stock is a point up, and Ever Ready shares have risen 3d. General Electrics have lost their advance of last week, and are back at 57s. 6d. Metropolitan Electric Supply ordinary shares have risen nearly 2s. Cables and Wireless "A" ordinary stock is a couple of points higher at nearly 85. London United Trams debenture stock has fallen from 55 to 51½, and Underground Electric Railways ordinary shares are 6d. easier.

INTERNATIONAL TELEPHONE AND TELEGRAPH CORPORATION.—Net income of Corporation and associates for six months ended June 30, 1929, $7 808 000, or $1.56 p. sh. Qrtrly. div. of 50 cents p. sh. will be payable on Oct. 15.

NIAGARA HUDSON POWER CORPORATION.—This $450 000 000 concern, recently formed by Morgan and Co., has, through purchase of the Frontier Corporation, acquired sites on the St. Lawrence river wh. will enable plants to be established to produce 28 400 000 H.P.

BARCELONA TRACTION, LIGHT AND POWER CO., LTD.—Qrtrly. div. of 1¾% ($1.75 p. sh.) in respect of fixed div. of 7% p.a. on the non-cum. participatg. pref. shs. will be paid on Oct. 1. London agents: Canadian and General Finance Co., Ltd., 3, London Wall Bdgs., London, E.C.2.

SIDRO CO.—Board has decided to maintain div. for year ended June last at 20% on pfd. and ord. shs., subject to approval of shhldrs. at gen. mtg. on Oct. 1. Dividend will therefore be 50 francs gross, or 47 francs net, tax free, on pfd. and ord. shs., while 182.80 francs gross or 171.80 francs net will be paid on founders' parts.

CENTRAL STATES ELECTRIC CORPORATION.—An issue of $25 000 000 25-year optional 5½% debs. of this corporation was made last week by Messrs. Dillon Read and Co. in New York. The corporation is the largest shhldr. in the North American Co., and has a controlling int. in the Class "B" shs.

Digitized by Google

of the American Cities Power and Light Corporation, and substantial holdgs. in other leading American public utility concerns.

RADIOVISOR FOREIGN AND COLONIAL.—Shhldrs. of Radiovisor Foreign and Colonial have been informed that the directors have concluded an agreement with Siemens and Halske A.G. of Berlin for exclusive rights of mfre. and sale throughout Europe of all apparatus involving use of selenium cells. Siemens and Halske undertake to buy Radiovisor cells from Radiovisor Foreign and Colonial at a fixed price, and to pay a royalty on all apparatus in which the cells are embodied. The agreemt. is for ten years.

INTERNATIONAL PAPER AND POWER CO.—For half-year ended June 30, 1929, rev. was $13 894 554; to depreciatn. $4 22 157; int. on funded debt, $5 273 579; amortisatn., of disct. on funded debt, $302 968; res. for income taxes, $426368; minority int. in earngs. of New England Power Associatn. and subsidiaries, $310 915; net rev. available for divs., $3 357 566; divs. on stks. of subsidiaries, $1 949 501; net rev. added to surplus, $1 408 064; surplus brt. in., $18 180331; surplus adjustmts., $£1 643 985; divs. on co's. stocks, $4 407 617; surplus June 30, 1929, $16 824 764.

SPHINX ELECTRIC, LTD.—In their 2nd qrtrly. report, directors draw attentn. to the fact that in the electrical world the months June-August represent the low water mark of the year, and it is therefore with no small amt. of pride that they are able to announce not only steady increases in sales week by week, but 96% increase over the June qrtr. and 184% over the corresponding qrtr. of 1928. The sales force have opened 1 301 new accts. during the past six months, including the General Post Office, Royal Court of Justice, Scotland Yard, etc. The company's purchase of the controlling interest in Setalite, Ltd., and Thornton Norris Products, Ltd., is proving to be a satisfactory transactn. Already negotiatns. are on hand with most of the principal car mfrs. in the British Isles for the incorporatn. of a Setalite as standard equipmt. while one contract now being negotiated with a foreign combine of car mfrs. will, if brought to a successful issue, show the company a minimum net profit of £65 000, apart from a further £20 000 that will accrue to Thornton Norris Products. As only £7 500 is required to meet preferential div. the prospects for both pref. and ord. shs. are of the brightest.

Company Meetings.

COLUMBIA GRAMOPHONE CO., LTD.—Lord Marks, presiding at the meeting on September 12th, said the profits for the past year were £505 120, or more than 25% increase over the preceding 12 months. They were now manufacturing a combined gramophone and radio instrument which they hoped to have on the market this year. Careful investigations and watchful observations of the radio industry had satisfied them it had reached stabilisation, and, that being so, they were convineed that now was the opportune moment for their company to commercially enter it. They had manufactured Columbia radio sets that they unhesitatingly said were equal to any competitive sets now known, and the three models they had just announced to the trade as coming on the market during this month had made them absolutely confident that they could look to a great expansion in this section of their business. The report was adopted. the payment of the preference dividend was confirmed, and the final dividend of 30%, making 45% for the year, on the ordinary shares, was approved.

ELECTRAMONIC CO., LTD.—An extraordinary general meeting of the Electramonic Co., Ltd., was held on September 12th, to consider a resolution for the voluntary liquidation of the company and the appointment of Mr. James Bell as liquidator. Sir Philip Dawson, M.P., occupied the chair. Mr. W. H. Sayers said that since the previous day he had had the opportunity of discussion with the chairman and directors of the company, and they had arrived at the conclusion that some arrangement might be arrived at. He had not altered his view as to the undesirability of liquidation of the company. He urged that bygones might be bygones, and the question of who was wrong and who was right be left alone and an endeavour made by all concerned to get the ship off the rocks. The Chairman said that certain statements had been made regarding himself and others, and he was anxious to answer all allegations which had been put forward, because there had been nothing done, in any shape or form, which would not bear the full light of day. The view of the directors was that the best possible thing in the interests of the shareholders was voluntary liquidation, with, if possible, a reconstruction of the company afterwards. The proposal for voluntary liquidation was lost by a large majority. A further resolution to appoint a committee of six shareholders with power to elect directors, and, if necessary, new solicitors, auditors, secretary, and any other officers of the company, was ruled out of order by the Chairman. He announced the resignation of himself and his fellow directors, and left the chair. Mr. A. G. Nathan, who was then voted to the chair, put the resolution which the chairman had ruled out of order, and it was carried on a show of hands and six members present elected.

New Companies.

FLAMWELL AND APPLEY, LTD.—Cap., £1 500. Manufacturers of and dealers in electrical apparatus, etc. A director: T. H. Flam well, 24, Watson Road, Worksop.

CHARLES MESSENGER AND CO., LTD.—Cap., £100. Electrical and general engineers, etc. A director: J. A. C. Messenger (chairman), 243, Brixton Road, London, S.W.9.

A. H. WHITEHEAD AND CO., LTD.—Cap., £300. Electrical, mechanical and radio engineers, etc. Reg. Office: 92, Upper Brook Street, Chorlton-on-Medlock, Manchester.

THE LEAD MARKET.

According to James Forster and Co., the lead market displayed a steady tone last week, although the best prices were not maintained at the close. The declaration early in the week of considerable quantities of lead against September contracts established a contango on prices of 3s. 9d. a ton.

Closing prices on September 13th were £23 8s. 9d. for September, £23 10s. for October, £23 11s. 3d. for November, and £23 12s. 6d. for December, 3s. 9d. down to unchanged on the week.

Receivership.

BRITISH ELECTRICAL REPRODUCTION CO., LTD. R. L. Latimer, C.A., 4B, Fredericks Place, E.C., was appointed receiver and manager on September 6th, 1929, under powers contained in debenture dated November 29th, 1928.

Private Meetings, etc.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

INCANDESCENT SYNDICATE AND ALLIED STORES, LTD.—This company, now in voluntary liquidation, was formed at the end of 1927, and acquired the Cardiff business carried on by James Wilfrid Fisk, who remained as chairman of the company. The stock was disposed of by auction last week. The company has no debentures.

PARCELL, E., wireless and electrical fittings dealer, Eastcheap, Letchworth. A meeting of the creditors of the above was held on September 11th at the offices of Corfield and Cripwell, accountants and auditors, Balfour House, Finsbury Pavement, E.C., when Mr. W. A. J. Osborne submitted a statement of affairs which showed ranking liabilities of £563, net assets estimated to realise £490, and a deficiency of £91. The assets comprised stock, £408, estimated to realise £230; book debts, £100, expected to produce £75; hire-purchase book debts, £78, valued at £50; cash register, £80, estimated to realise £50; office furniture, etc., £50, expected to produce £25; tools, benches, etc., £50, valued at £30; and household furniture, £100, estimated to realise £30. Mr. Osborne stated that the debtor had been carrying on business for a number of years. About two years ago the creditors were consulted, and they agreed to accept 10s. in the £ by four equal instalments, and that composition had been paid. In 1927, there was a surplus as a going concern of £79, but it was then estimated that if a realisation took place, there would be a deficiency of £241. It would appear that the position had improved since 1927, but that improvement was due to the fact that the old liabilities had been discharged by the payment of 10s. in the £. During recent months every effort had been made to do something with the business, and attempts had been made to sell it as a going concern. It was understood that there was a syndicate which was prepared to buy a large number of small retailers' shops in the wireless and electrical trade in different parts of the country. Efforts had been made to get in touch with that syndicate, but nothing definite had been done. The premises were held on a lease for 21 years from 1925, at a rental of only £45 per annum. The lease should be of some value. There were a number of pressing creditors. The drawings had been at the rate of £3 a week. The debtor thought he could carry on the business profitably, but Mr. Osborne said that unless the turnover could be increased, he did not see how the concern could be made a success. A substantial turnover was done during the winter months, but during the summer the sales fell off considerably. It was decided that a deed of assignment should be executed, with Mr. W. A. J. Osborne as trustee.

London Gazette, etc.

Company Winding-up Voluntarily.

RHAYADER ELECTRIC LIGHT AND POWER CO., LTD. By Special Resolution, August 8th, confirmed September 3rd. J. Stephenson, Victoria Hall, Llandrindod Wells, Incorporated Accountant, appointed as liquidator. Meeting of creditors at Victoria Hall, Llandrindod Wells, on Friday, September 20th, at 11 a.m. (This notice is purely formal. All creditors will be paid in full.)

Bankruptcy Information.

GREEN, William, 3, York Street, Stourport, Worcester, wireless dealer. Receiving order September 6th. Debtor's petition. First meeting, September 20th, 12 noon. Lion Hotel, Kidderminster. Public examination, October 1st 12.30 p.m., Town Hall, Kidderminster.

PAGE, Edgar George Matthews, Bohemia Road, St. Leonards-on-Sea, dealer in wireless sets and accessories. Receiving order, September 11th. Debtor's petition.

SHAPLAND, Albert Edwin, 13A, High Street, Budleigh Salterton, electrical engineer. First meeting, September 20th, 11.30 a.m., Official Receiver's Offices, Exeter Bank Chambers, Broadgate, Exeter. Public examination, October 17th, 11 a.m., The Castle, Exeter.

STONE, George Frederick Amos, trading as STONE MANUFACTURING CO., 108, Great Saffron Hill, London, electrical accessories manufacturer. Receiving order, September 12th, creditor's petition. First meeting, September 25th, 11.30 a.m., and public examination, October 29th, 11 a.m., Bankruptcy Buildings, Carey Street, London, W.C.2.

Notice of Dividend.

HOLMES, Harold, 60, Ward's End, Loughborough, Leicester, electrical contractor. First and final dividend, 4s. per £, payable September 19th, Federation Chambers, Wheeler Gate, Nottingham.

Notices of Intended Dividends.

BLOOD, Ralph, 44 and 46, Station Road, Padiham, Lancashire, wireless dealer and electrician. Last day for receiving proofs, October 2nd. Trustee, J. W. Carter, District Bank Chambers, Blackburn, Official Receiver.

HORSFALL, Robinson, trading as HARRISON AND HORSFALL, Midland Street, Barnsley, electrical engineer. Last day for receiving proofs, October 1st. Trustee, C. H. Baker, Standard Buildings, City Square, Leeds.

Partnership Dissolved.

M'LAREN AND HAY (David M'LAREN and George HAY), electro platers and bronzers, 11, Maitland Street, Glasgow, as at July 31st, 1929, by mutual consent, by the retiral of G. Hay. The business will be carried on by D. M'Laren on his own account, under the old name.

Application for Discharge.

SANDGROUND, Arthur, 32A, Allerton Road, Lordship Park, London, wireless factor. Hearing, October 16th, 10.30 a.m., Court House, Upper Edmonton.

Bankruptcy Proceedings.

STEVENS AND COLE, LTD., wireless, etc., dealers, 46, Barking Road, Canning Town, E. The statutory first meeting of the creditors and shareholders of this company (in liquidation) were held on September 10th at the Board of Trade Offices, Carey Street, W.C., before Mr. H. P. Naunton, Official Receiver. A statement was submitted showing liabilities £2 497 against assets £904, or a deficiency of £1 743 with regard to contributories, the issued capital being £150. The chairman reported that the company was formed in June, 1928, to carry on the business of dealers in wireless equipment, gramophones, records and accessories, the managing director being Mr. Leonard Cole. It originally had two shops at 251D and E, East India Dock Road, and 46, Barking Road, where Cole had been trading under the style of Stevens and Cole, but the East India Dock Road branch was given up in September, 1928. Early in March last the company opened another branch at 284, Barking Road, but the premises were burgled shortly afterwards, stock to the value of £100 being taken, and as it was not insured the amount was a total loss. The business of the company did not flourish, and through lack of cash to meet the demands of pressing creditors, Mr. Cole, in April, advanced £150 to the company on the security of a debenture for that amount. Mr. Harris Rainsbury was appointed receiver on June 25th; he carried on the business for a time, and then sold the balance of the stock and effects at 46, Barking Road for £220. The only other asset of importance was the lease of 284, Barking Road; an offer of £450 was made for it last May, but owing to illness on the part of the purchaser, it was not proceeded with, and it was doubtful whether the lease would now fetch anything like that sum. The failure of the company was attributed to severe trade competition, depreciation in the value of stock and lack of experience by the directors. The liquidation was left in the hands of the Official Receiver.

MET-VICK FIRES *for* Season 1929-1930

Electrical Contractors and Resellers who are out for a bigger share of the fire business, are concentrating on the comprehensive range of 'Met-Vick' Fires here illustrated, of which a convenient condensed price list is given below:—

Type and Finish / Loading:	·6 kW.	1 kW.	2 kW.	3 kW.
BOWL FIRES:				
Small - Oxy-Copper	19 : 6			
Large - Oxy-Copper	27 : 6			
FLAT BAR:				
Black Enamelled		33 : 6	45 : 0	67 : 6
Oxydised Copper		37 : 6	50 : 0	72 : 6
White Enamelled		—	70 : 0	—
RADIANT:				
Standard Oxy-Copper		42 : 0	65 : 0	80 : 0
" Oxy-Silver		47 : 6	—	—
Jacobean Oxy-Copper			77 : 6	100 : 0
" Oxy-Silver			82 : 6	110 : 0
Empire - Oxy-Copper				110 : 0
" Oxy-Silver				120 : 0
Adam - Oxy-Silver				195 : 0
IMITATION COAL:				
Savoy - Oxy-Copper			145 : 0	170 : 0
" Oxy-Silver			152 : 6	177 : 6
Tudor - Oxy-Copper			175 : 0	200 : 0
" Oxy-Silver			182 : 6	207 : 6
" Chromium			190 : 0	215 : 0
SCREEN:				
Oxy-Copper			85 : 0	
Oxy-Silver			92 : 6	

SPECIAL OFFERS TO THE TRADE.

(1) To assist retailers who wish to make an attractive display of electric fires; a special discount is allowed on the first order of the season, for one consignment of six assorted fires.

(2) Throughout the season orders for not less than seven assorted fires, are also subject to a special discount.

Large stocks are held at each Met-Vick Branch.

The special publication "Favourite Fires" is ready and can be overprinted for distribution to your customers.

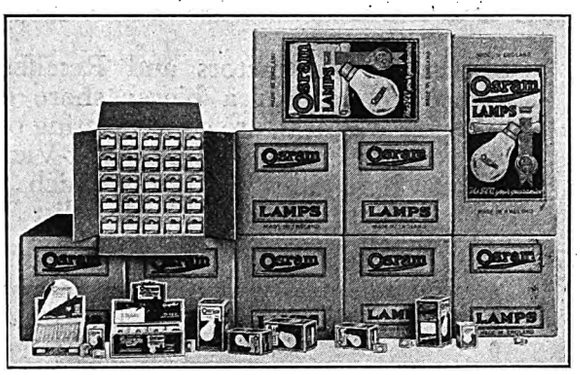
PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents, by permission of the Controller of H.M. Stationery Office.) Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

315 441 W. Rea. Automatic electric switch mechanism. (13/2/28.)
315 443 S. G. S. Dicker (N. V. Philips' Gloeilampenfabrieken). Multiphase alternating-current rectifiers. (13/2/28.)
287 138 International General Electric Co., Inc. Electric discharge tubes. (16/3/27.)
315 447 English Electric Co., Ltd., and G. Tilstone. Electromagnetic indicating devices, relays, and the like. (13/3/28.)
294 196 Siemens and Halske Akt.-Ges. Circuit arrangement for transmitting signal messages over telephone lines. (20/7/27.)



A COLLECTION of G.E.C. publicity material which has been prepared in connection with the company's lamp-selling campaign.

315 234 S. G. Double and B. J. Hall and Co., Ltd. Distribution of electric current. (31/3/28.)
288 208 Compagnie des Mines D'Ostricourt. Electrical precipitation of suspended particles. (4/4/27.)
288 300 Fabrique D'Appareils Electricque Favarger Soc. Anon. Electric signalling systems. (5/4/27.)
315 284 S. A. Stevens and Westinghouse Brake and Saxby Signal Co., Ltd. Apparatus for rectifying alternating-currents. (4/4/28.)
315 204 Chamberlain and Hookham, Ltd., and S. James. Electricity meters. (5/4/28.)
315 244 Creed and Co., Ltd., and R. D. Salmon. Electric transmitters suitable for use in telegraphy. (10/4/28.)
315 246 Wild-Barfield Electric Furnaces, Ltd., and L. W. Wild. Electric furnaces. (10/4/28.)
315 286 E. Spielmann. Electric music instrument. (10/4/28.)
315 247 W. Luxford. Devices for application to pipes for repairing bursts, earthing electrical apparatus, and for other purposes. (10/4/28.)
315 291 Siemens Bros. and Co., Ltd., and D. P. Long. Automatic and semi-automatic telephone systems. (11/4/28.)
315 292 Electrolux, Ltd. (Platen-Munters Refrigerating System Aktiebolac.) Absorption refrigerating apparatus. (11/4/28.)
315 452 General Electric Co., Ltd., and E. H. Croft. Control of electrical apparatus. (12/4/28.)
315 337 Dr. F. B. Dehn (Burroughs Adding Machine Co.). Speed controlling mechanism for electric motors (12/4/28.)
315 457 A. Reyrolle and Co., Ltd., and G. R. Wilson. Electric couplings. (13/4/28.)
293 685 Central Electric Tool Co. Electromagnetic reciprocating motors. (9/7/27.)
315 481 F. Collingridge. Apparatus for the recovery of metals by electrolysis. (18/4/28.)
315 482 Standard Telephones and Cables, Ltd., E. P. Goodwin, J. H. E. Baker, and A. H. Cameron. Automatic and semi-automatic telephone systems. (18/4/28.)
315 487 T. A. Biddington and R. Field. Wireless receiving apparatus. (19/4/28.)
315 488 P. D. Tyers. Method of electrically reproducing gramophone and like sound records. (19/4/28.)
315 496 R. E. H. Carpenter. Relays and other electromagnetic instruments and machines. (25/4/28.)
315 499 Simplex Conduits, Ltd., and H. F. McLoughlin. Electric fuses. (27/4/28.)
295 677 J. W. Hofmann (trading as J. W. Hofmann (firm of)). Clamping devices for electric conductors. (17/8/27.)
289 778 Associated Electrical Industries, Ltd. Electric circuit breakers. (30/4/27.)
289 782 Telefonaktiebolaget L. M. Ericsson. Telephone systems comprising automatic telephone exchanges of different systems. (30/4/27.)
315 511 Igranic Electric Co., Ltd., and J. H. Abbink-Spaink. Electrical supply systems. (7/5/28.)
290 576 British Thomson-Houston Co., Ltd. Systems of electric distribution. (23/5/27.)
290 642 E. H. Armstrong. Radio telephone signalling. (18/5/27.)
315 515 British Thomson-Houston Co., Ltd., and L. J. Davies. Flicker-producing devices applicable to imitation solid fuel fires. (18/5/28.)
315 521 G. L. Porter and Ferranti, Ltd. Electic cable protection. (23/5/28.)
306 109 Siemens-Schuckertwerke Akt.-Ges. Fuse bases. (17/2/28.)
315 532 J. M. Ortega. Aerial conductors for use in radio communication. (1/6/28.)
294 873 S. C. L. V. Larsen. Concentric wall-plugs for electric wiring. (30/7/27.)
315 551 K. Wolinski. Diaphragms for electrolytic cells. (20/6/28.)
315 556 Chloride Electrical Storage Co., Ltd., and B. Heap. Electric accumulators. (22/6/28.)
293 318 E. Pohl. Röntgen-tube having its anticathode movable relatively to th e cathode. (2/7/27.)

Applications for Patents.

June 21st.

19 109 Siemens and Halske A.G. Carrier frequency transmission system. (30/6/28 Germany.)
19 116 Siemens and Halske A.G. Circuit arrangements for conference telephones. (10/10/28, Germany.)
19 111 Soc. Anon. Brevetti Elettrici. Electric heating plate. (21/6/28, Italy.)
19 112 Soc. Anon. Brevetti Elettrici. Electric flat-iron. (21/6/28, Italy.)
19 089 Standard Telephones and Cables, Ltd. (M. den Hertog and C. E. Stevens). Telephone systems.
19 128 Telefunken Ges. fur Drahtlose Telegraphie. Arrangements for heating cathodes of valves, etc. (23/6/28, Germany.)
19 129 Telefunken Ges fur. Drahtlose Telegraphie. Arrangements for timing high frequency circ uits. (23/6/28, Germany.)
19 130 Telefunken Ges. fur Drahtlose Telegraphie. Wireless signalling apparatus. (25/6/28, Germany.)
19 153 Telehor Akt.-Ges. Television apparatus. (21/7/28, Germany.)
19 154 Telehor Akt.-Ges. Glowlamps for television apparatus. (21/8/28, Germany.)
19 155 Telehor Akt.-Ges. Television projecting apparatus. (2/10/28, Germany.)
19 158 R. J. Tugwood (G.M.S. Products, Inc.). Electric switches.

June 22nd.

19 235 J. Anderson. Electric circuit breakers.
19 201 Arcturus Radio Tube Co. Radio receiving systems. (23/6/28, U.S.)
19 250 Associated Electrical Industries, Ltd., G. A. Cheetham and H. Lister, Prepayment devices.
19 251 Associated Electrical Industries, Ltd. Regulating systems for dynamos. (29/6/28, U.S.)
19 248 C. B. Backer. Electric heating elements.
19 246 C. L. Baudry de Saunier. Attaching electric wires to electrodes. (3/7/28, France.)
19 227 British Thomson-Houston Co., Ltd. Light sensitive apparatus. (22/6/28, U.S.)
19 212 R. Bruni. Radio truphonic systems. (23/6/28, Italy.)
19 253, 19 254 English Electric Co., Ltd., and F. Morris. Current collectors for electric railway vehicles.
19 188 T. Gray. Remote control switches.
19 243 H. J. Garnett, W. F. Randall, and W. S. Smith. Manufacture of magnetic alloys.
19 232 D. A. Oliver. Alternate current phase-splitting systems.
19 230 G. H. Schiefirstein. Influencing oscillatory systems and non-cohesive masses. (22/6/28, Germany.)
19 184 G. A. Stravrokov. Magnetic compasses.
19 183 A. M. Taylor. Electric power transmission.
19 186 J. Wilson. Sound reproducing kinematograph projectors.

June 24th.

19 355 M. Bandle and Howards and Sons, Ltd. Variable resistances. (23/6/28, Germany.)
19 274 C. F. S. Bilbrough. Method of charging Daniell cells.
19 336, 19 337 British Thomson-Houston Co., Ltd., F. H. Clough, C. G. Mayo and J. G. Wellings. Transformers.
19 513 British Thomson-Houston Co., Ltd. High voltage cable testing systems. (25/6/28, U.S.)
19 514 British Thomson-Houston Co., Ltd. Vacuum switches. (25/6/28, U.S.)
19 515 British Thomson-Houston Co., Ltd. Mounting filaments. (25/6/28, U.S.)
19 347 F. R. Butterus. Relays.
19 364, 19 365 P. H. Chase. Electric cables. (25/7/28, U.S.)
19 367, 19 368 A. S. Cachemaille (Westinghouse Lamp Co.). Thermionic cathodes of vacuum electric tube devices.
19 300 A. R. Clarke and A. E. Hall. Device for earthing electricity.
19 401 R. J. Frost. Electrolytic production of white lead. (6/7/28, U.S.)
19 416 General Electric Co., Ltd., and W. Wilson. Electric power plants for running in fluid pressure engines.
19 330 J. G. Hall and A. J. E. Osbourn. Electric magnets. (6/6/29.)
19 321 S. B. Hamilton. Electric torch lamps.
19 344 L. G. Hawkins and L. G. Hawkins and Co., Ltd. Electric inspection lamps, etc.
19 403 W. Hribar. Transformer.
19 409 E. Kleinmann, Kleinmann Geb. and A. Mendel. Pins for thermionic valves, etc.
19 393, 19 394 Kolster-Brandes, Ltd., and T. D. Ward-Miller. Electric connections.
19 395 Kolster-Brandes, Ltd. Radio signalling. (23/6/28, U.S.)
19 396 Kolster-Brandes, Ltd. (Kolster Radio Corporation). Electric rectifying systems.
19 357 J. E. Lilienfeld. Electric vacuum tubes. (3/10/28, U.S.)
19 295 M. Seliger. Electric drive of trains.
19 381 Siemens-Reiniger-Veifa Ges. fur Medizinische Technik. Apparatus for operating Röntgen tubes. (23/7/28, Germany.)
19 377, 19 378, 19 379 S. Thompson. Electric heating devices.
19 418 M. Tranton and Wireless Music, Ltd.—Electromagnetic loud speakers, etc.
19 267 W. G. Turner. Electric liquid heaters.

June 25th.

19 559 American Travelling Sign Co. Circuit control apparatus. (19/7/28, U.S.)
19 545 Automatic Telephone Manufacturing Co., Ltd., C. E. Beale and H. S. Deyes. Telephone systems.
19 449 H. S. Benson. U-shaped thermometers adapted to close electric circuits.
19 532, 19 533 H. H. Berry and C. A. Painton. Electric water heaters.
19 534 H. H. Berry. Electric fires.
19 480 B. Crentsil. Galvanic cells.
19 415 F. G. G. Davey. Electromagnetic loud speakers.
19 518 Electrical Research Products, Inc. Signalling systems. (15/9/28, U.S.)
19 485 Electro-Medical Supplies and C. H. Greenham. Electro-medical apparatus, etc.
19 430 General Engineering Co. (Radcliffe), Ltd., and S. Taylor. Impregnation of dielectric materials.
19 438 Handelsvenootschap onder de firma J. Schleper and Zonen. Electric testing device. (26/6/28, Holland).
19 467 A. Lederer. Electrical discharge tubes. (3/7/28, Austria.)
19 459 H. C. Mahoney. Turntable for portable wireless sets.
19 511 A. M. Newman and J. Suchomski. Electrical sound box for talking machines.
19 522 Siemens-Reiniger Veifa Ges. fur Medizinische Technik. Metal vapour lamp. (26/6/28, Germany.)
19 529 Siemens and Halske A.-G. Electroplating with chromium. (26/6/28, U.S.)
19 435 F. L. Smith. Receiving wireless signals.
19 539 Soc. des Magnetos R.B. Electric equipments for motor vehicles. (20/10/28, France.)
19 493 Telefunken Ges. fur Drahtlose Telegraphie. Radio, etc., valve transmitters. (30/6/28, Germany.)
19 494 Telefunken Ges. fur Drahtlose Telegraphie. Keying systems for radio, etc., valve transmitters. (30/6/28, Germany.)

Current Topics.

Autumn Trade Promotion.

THE sudden change in the weather and the consequent drop in temperature are causing the public to give serious consideration to winter preparations, and the time is now appropriate for electrical contractors to give to their windows that atmosphere of warmth which the electric fire is able to create. We publish elsewhere in this issue a number of suggestions received from manufacturers with a view to promoting autumn trade, and from these descriptions it will be gathered that a number of new lines have found their way to the market. Besides fires there are cookers, and at a time like the present, when the September quarter sees many changes in domestic addresses, the purchasing of new houses, etc., the careful display of electric cookers should do much to augment the usual brisk demand. The cold spell of last February did more to convert the public to electric heating than any campaign, and, bearing in mind the fact that every householder still remembers the "big freeze," the trade should prepare for greatly increased sales in all heating apparatus, portable and otherwise. That manufacturers are ready for such demand is evident from the number of designs available, and if the winter is to be as seasonable as was the summer, stocks will need to be large and varied. Another point worthy of attention is the effect of the summer sunshine. Lighting fittings and shades, purchased in the spring in order to withstand inspection during the long daylight hours, have in some cases lost their colour under the unusual glare, with the result that many housewives would not be averse to replacing faded shades for the winter months. Retail readers hardly need to be reminded of the valuable aids to autumn campaigning that are ready to hand in the E.D.A. Electric Homes Campaign and in the E.L.M.A. Glareless Light Campaign. Every preparation has been made for a really busy lighting and heating season, and, if individuals make full use of their opportunities, turnover will be large.

The National Radio Exhibition.

OF late years one has always associated the National Radio Exhibition with some new component which has tended to awaken flagging interest in radio, but this year the exhibition heralds the coming of some dozens of new sets, components, loud speakers, etc. The exhibition is further assisted by the rekindled interest in radio brought about by the testing of the Brookman's Park station and the promise of television at the end of the month. All things considered, therefore, the number of people attending is likely to be far in excess of any previous year, and electrical contractors interested in radio sales are advised to make an early visit. Preparations for autumn trade might well include radio, for with the publicity of the exhibition and the general enthusiasm of the public in the new developments, valuable sales can easily be brought about. Reverting to the exhibition itself, set designers are apparently concentrating on mains-operated equipment, and sets of all sizes, at prices to suit all pockets, are now available. One of the most noticeable features of the show is the number of different makes of portable sets on the market, which, judging from reports, are finding a ready sale. Another point of interest is the comparative absence of loud speakers in various disguises, the finish of this year's designs being such as to justify their exhibition without that unspoken, though none the less inferred, apology of previous shows. On the whole the exhibition is a good one and likely to reward the electrical contractor who is enterprising enough to inspect its stands.

Radio Trade Overseas.

IT is interesting to observe that, according to a recently published American "Commerce Report," the United States is the exclusive supplier of mains-operated radio receivers in New Zealand. Another point is that American valves "are very much in demand, the only competitive tube of any importance being of Dutch manufacture." British valves, we are informed, are mainly used in connection with set kits. The same report also states that the United States supplies the largest part of the trade in imported storage batteries, followed by Great Britain, the respective valuations last year being £409 539 and £266 238. These facts are all the more interesting in view of the fact that one of the chief visitors to the National Radio Exhibition will be Mr. J. LEVENSON, of Sydney, who is, according to report, out to buy equipment most suited to Australian radio conditions. After leaving this country Mr. LEVENSON will visit the United States with the same object in view, and it behoves every radio manufacturer to see that whatever impression he takes away from Olympia is not forgotten when America is reached. That Australia and New Zealand have been neglected so far as British radio goods

Digitized by Google

are concerned is well-known, but, whatever may have been our shortcomings in the past, it is imperative that future policy includes these potentially big Empire markets. Our loud speaker trade with those two countries is a long way ahead of the American, and there is no reason why we should not lead in all other branches of the industry. Technically, British radio is well in advance of American practice, but whereas the Americans sell their goods in the form that is wanted by listeners in the southern hemisphere, we, apparently, hope to convert their views by offering sets which home conditions demand. Obviously, our Antipodean friends, flattered by the American attention, resent such treatment at the hands of their own kin.

Illumination Design Courses.

THE value of the Illumination Design Courses which are provided by the E.L.M.A. Lighting Service Bureau is so widely appreciated that it is hardly necessary for us to emphasise it here. It is sufficient, in fact, to announce that the twentieth of these courses opens at Savoy Street, London, on October 21st, that the programme will cover the more important fields of lighting in accordance with the very latest practice, and that all members of the electrical trade are cordially invited to attend. As on this occasion the course will occupy seven successive Monday evenings—the last lecture being on December 2nd—many of those who were unable to devote several whole days to attendance at these courses will now be able to do so without sacrificing working time.

Backs to the Wall.

THAT the gas industry takes a serious view of the work of the Lighting Service Bureaux is obvious from recent remarks in the gas journals, one of which is now strongly advocating the establishment of a Gas Lighting Service Bureau. The pathetic efforts of the gas industry to follow and approximate as closely as possible to electrical methods, as instanced in their remote-control switches and plug points, have for some time indicated that all was not well in the gas camp, but the position now seems to be sufficiently serious for those best qualified to judge its gravity to admit quite openly, not only that "gas is not making the progress that it should in the lighting world," but that "retrogression would be a more accurate description of its present motion." The only ray of hope discernible by the physicians of the gas industry is seen in the proposed Gas Lighting Service Bureau, but our friends in Savoy Street may be pardoned if they view it as a very feeble ray.

The Electric Iron.

REFERRING to our recent remarks on the use of electric irons in the U.S.A., and in particular to the statement that there are still 50% of American homes without an electric iron, the "Hardware Trade Journal" pertinently asks how many British homes are deficient in this respect. The question is one that would be difficult to answer with any degree of accuracy. It is, at any rate, safe to say that the percentage is certainly not less than the American figure, and probably considerably higher. Knowledge of the exact number of people in this country who have not yet discovered the many advantages of the electric iron would no doubt be interesting, and a series of individual investigations of this kind, made by electrical contractors in their own localities, would be both practicable and profitable.

Working Temperatures.

ATTENTION nowadays is rightly directed to the various factors which influence efficiency, but observations during the hot spell of the last few weeks suggest that one factor—working temperatures in such places as technical and clerical offices—is apt to be overlooked altogether. If indoor staffs are to work without undue fatigue, it is essential that the temperature should be maintained at a suitable level. Anything between say 62 deg. and 65 deg. F. is a reasonable proposition. In many cases, unfortunately, it is either too hot or too cold. Of the two extremes, the latter is least objectionable, but neither is desirable, and neither tends towards increase in efficiency. There is nothing more fatiguing or exasperating than the attempt to carry on intelligently with the thermometer registering 85 deg. F. Where freshness of thought, care in calculation, the creative work of responsible design, the close application of overlooking and checking the work of others, are concerned, the result cannot be felicitous while the main effort is perforce to keep oneself awake. The drowsiness and consequent sluggishness which such conditions engender has without question a most retarding influence upon the quantity and the quality of the output. If statistics—quantitative and qualitative—were kept of technical progress over a period, under different temperature conditions, they would give any discerning management most serious food for digestion. As a result, careful control of temperature and ventilation in the interests of the human material would be insisted upon. What is here urged may seem a very trifling matter. Actually, it may be very important. As an industry providing the best possible means for both heating and cooling we should make a point of using the remedial equipment which we supply, and experience of the benefits so received would be helpful in indicating the best ways of passing them on to others.

The "Talkie" Dispute.

IT is unfortunate that the Klangfilm group and the Western Electric Co. have so far failed to reach agreement as to the development and exploitation of the sound film producing and reproducing apparatus in which both groups are interested. The German interests are seeking to restrain the Western Electric Co., by injunction, from working their system in Germany on the ground of infringement of patent rights, and the Americans have demanded, and have been refused, a complete monopoly for their apparatus in the English speaking world. Unless some compromise can be reached a costly legal conflict seems inevitable.

Electricity and the Bodleian.

FEAR of the consequences of an outbreak of fire has for many years deterred the curators of the famous Bodleian Library at Oxford from using artificial lighting of any sort in the library. The recent decision to light this priceless storehouse of information by electrical means is therefore of more than passing interest, and we hope that supply authorities and contractors will not fail to use this example in their propaganda to show that electricity, if properly installed, is the safest illuminant in existence. What is good enough for the Bodleian is certainly good enough for Mrs. Brown.

Clever Psychology.

MENTION of Mrs. Brown naturally leads to recognition of the clever psychology to be seen in the latest newspaper advertisement of the Telephone Development Association, the main feature of which is the passage: "Mrs. Brown's on the phone! Mrs. Smith's on the 'phone!! Mrs. Jones is on the 'phone!!! Are you on the 'phone?" The average housewife's desire to emulate her neighbours in dress, furnishings and conveniences is well recognised, especially by those who are fortunate enough to foot the bills, but this trait seems to have been insufficiently appreciated or exploited by the purveyors of electrical service in the home.

A Belated Decision.

WE must congratulate the London, Midland and Scottish Railway on its somewhat belated recognition of the desirability—so frequently stressed in these columns—of converting its gas-lighted rolling stock to the convenience and safety of electric lighting. In a large scheme of modernisation, involving an expenditure of £2 250 000, the company proposes to allot £200 000 for electric lighting plant in trains at present lit by gas. We hope that other companies concerned will follow the lead of the L.M.S. Perhaps it is expecting too much to ask that they should all contemplate a similar conversion in the lighting of railway stations.

A NEW THREE-PHASE SYSTEM.

A Proposed "A" System for Transmission and Distribution and its Suitability for Single or Three-phase Units and Secondary or High-Tension Practice.

By WILLIAM T. TAYLOR, M.Inst.C.E., M.I.E.E.; Fel.A.I.E.E.

ELECTRICAL systems either with earthed neutral or earthed return conductor have long been in general use. The former is commonly derived from the star system, the latter from the delta system. In their arrangement they must, for best service conditions, have equal voltages between the different phase conductors and the earthed neutral or the earthed return-conductor, respectively. The star system provides for equal maximum voltages to earth, but not so the delta. For the delta system the universal practice is to earth the middle point of one phase winding, which practice provides a maximum voltage to earth approximately 29 per cent. higher than the star system of equal line phase-voltage.

Up to the present time there have been in operation five distinct three-phase systems; these systems are commonly designated as the "Y," "Z," "V," "T," and delta. The writer proposes another system, which, for descriptive purposes, he calls the "A" system.

At the present time many distribution systems, in particular, have reached a stage of expansion where a change in line voltage is necessary to reduce excessive voltage drop or power losses, or to allow of further extensions. The only available and commonly recommended system so far in use for conversion from delta is the star system. This gives an increased line voltage of 73%, which voltage increase reduces the current flow over the line for the same kVA delivered.

However, it does not provide increased kVA capacity of the existing transformers; further transformer kVA capacity must be installed to satisfy the increased kVA carrying capacity of the line. It is, therefore, evident that any of the *six* systems above mentioned must increase the transformer kVA capacity to satisfy the increase in line voltage, and consequent additional kVA carrying capacity, but the number of transformer units and sizes and types will not be in the same proportion for all the systems. Of the above-mentioned systems, the "V" and "T" systems are objectionable because of the loss of nearly 15% transformer kVA capacity, and the delta system is objectionable because it does not provide a true neutral point or symmetrical voltages to earth (see Fig. 1B).

Not unlike the delta, the "V" and "T" systems, the "A" system (proposed herein for both transmission and distribution) is well suited to single-phase unit and secondary distribution practice; the "A" system is also suited to the three-phase unit and high-tension practice. On the other hand, the star system is best suited to the three-phase unit and high-tension practice. The "A" system not only forms a bridge between the delta, the "V" and the "Y" systems, but it is a combination of these systems for the primary or/and the secondary.

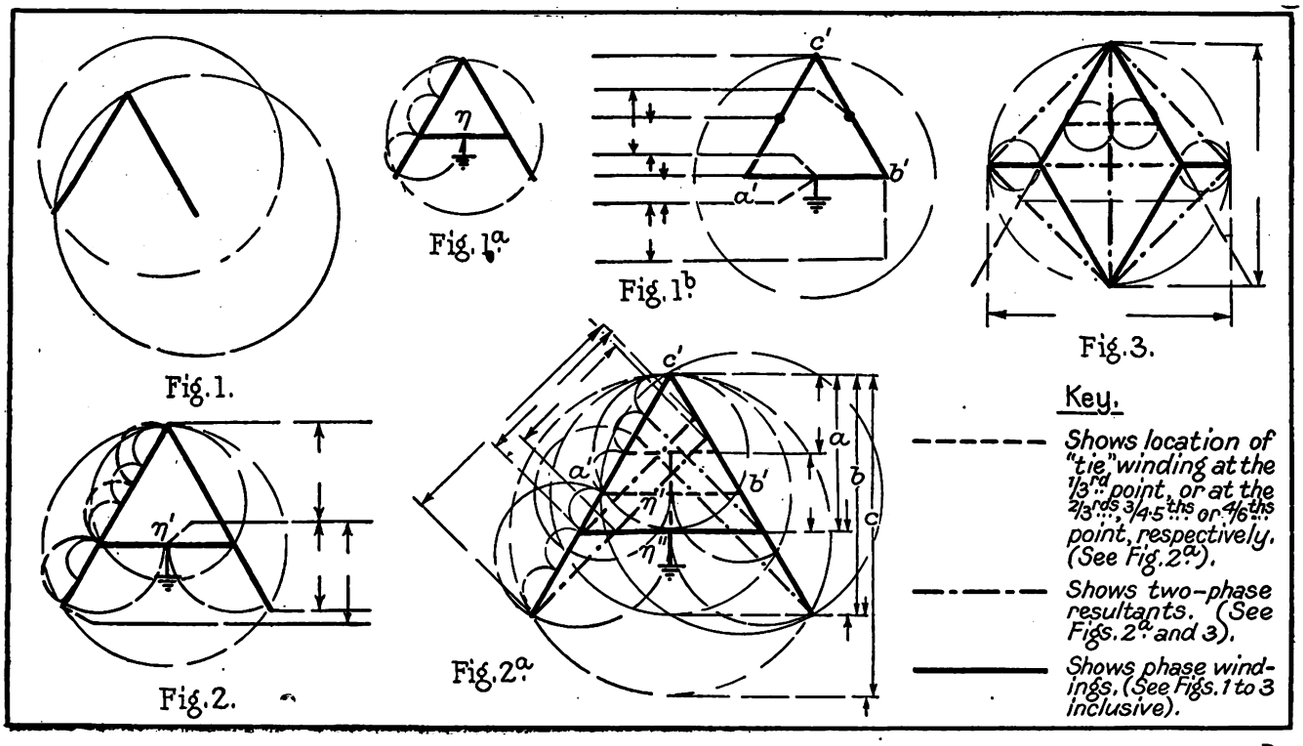
According to recent statistics, the majority of transformer installations operating with the "V" and the delta connections are on the American continent. Not only is the "V" connection inefficient in kVA capacity, but the system does not provide a true neutral point, and the voltage stress to earth is 29% higher than the equivalent star or "A" line-voltage (see Fig. 1A), and a three-limbed polyphase unit cannot be used. The relative maximum voltages to earth for the "V" and the "A" systems, for equal line voltage, are shown in Fig. 1 and Fig. 1A by means of the three different sized circles.

Advantages of "A" System.

The field of usefulness of the "A" system is given herein in its most condensed form. Several good reasons exist for its introduction into practice at this juncture of electrical progress. It provides means for improving both the "V" and the delta systems, for changing the line voltage from one standard to the next standard without disturbing the existing phase relations or the transformers or the system, and to permit of a gradual system change-over or/and local change-over, and allow of the same facilities for system (or installation) parallel operation of units of the same circuit voltage.

At one time or another the question of voltage increase of circuit or system arises. It is simple to change from delta to star, but not so where only a star system remains. On the other hand, when changing from delta to star there is the odd line voltage to contend with, which future transformer installations are called upon to meet.

The "A" system of Fig. 2 offers simplicity itself, and provides a standard phase-voltage, and will, as a general rule, meet the requirements of line losses, voltage regulation, increased carrying capacity of line, and other requirements, such as use of the same line insulators, etc. Moreover, as will be seen, there is no necessity to touch or go into or change connections of existing transformers; half of one phase-



D

Digitized by Google

winding is connected to the two legs shown, *i.e.*, to the respective line terminals *a'* and *b'* of Fig. 1B, which converts the delta system into the "A" system, so that a 2 200 V line becomes a 3 300 V line, a 6 600 V line becomes a 10 000 V line, a 44 000 V line becomes a 66 000 V line, an 88 000 V line becomes a 132 000 V line, etc. The voltage to earth is not increased, the parallel operation of units may continue as before, a true neutral point is obtained, a symmetrical earthed system is secured, etc., all in the simplest possible manner, to be done at leisure, in the cheapest way, and without fear of phase displacement and future complications.

The "A" system of Fig. 2 permits of the same maximum voltage to earth as the delta system of Fig. 1B, but, in this case, a symmetrical voltage to earth is provided with a 50% increase in line voltage above that of the delta phase voltage. Or, as desired (depending on whether we are considering a change in the high-tension transmission line, the primary or the secondary distribution voltages), we may increase the line voltage by 100% (see Fig. 2A) which gives a 29% increase in voltage above earth compared with the delta of Fig. 1B.

We thus see that the delta system has the same maximum percentage voltage above earth compared with Fig. 1A as the "A" system of Fig. 2A has above the delta system. This is shown in Fig. 2A by the values *a*, *b* and *c*. As a rule, we can safely assume that the maximum of 29% increase in voltage above earth, compared with the delta of Fig. 1B, for, say, a 3 300 V delta system, need not necessarily mean a change of the line insulators for the "A" system of Fig. 2A when operating at 6 600 V across phases with *n''* winding earthed. In each figure (Figs. 1 to 2A) the relative maximum voltages above earth are shown by circles; for the purpose of comparison, relative circle values *a*, *b*, and *c* are given in Fig. 2A.

Comparative Advantages.

To best meet present *standards*, when converting from the delta system, the advantages of systems and voltages are shown in the following :—

Delta System.		*Star* System.		"*A*" System.		
Line to line voltage. (see Fig. 1B)	Maximum voltage from line to earth. (see Fig. 1B)	Line to line voltage*	Symmetrical voltages from line to neutral.	Line to line voltage.	Same voltage as the original system.	Symmetrical voltages from line to neutral.†

(*For the above*, (6) *and* (7) *refer to conversions from Fig.* 1 *or* 1B *to* 1A.)						

* Standard phase (or line) voltages are always required to meet standard transformer practice; very few of these voltages conform to standard practice. It will therefore be noted that the "A" system better meets all the requirements of line and neutral voltages for increase to the 50% or 100% line voltage or for a decrease in voltage.

† It is only for primary and secondary *distribution* that these voltages are sometimes required to meet standard transformer practice—the more usual line to neutral voltages for distribution being 115, 230, 2 300 and 3 800 V, respectively.

A primary object of the increase in line voltage is to increase the circuit or system kVA-carrying capacity. A conversion to the "Y," the "A," or any other system, will thus mean an increase in transformer kVA capacity to warrant the desired expansion and/or extension, and/or serve the best purposes o the change-over.

For a single-phase unit or for one bank installation, which form the majority of transformer installations, the "A" system should prove specially useful. The "A" system kVA capacity is automatically increased by the manner of increasing the line voltage, whereas a mere change from delta to star does not provide for any additional kVA capacity being carried by those transformers or installations already loaded to their rated capacity.

Other Phase Transformations.

A further object of the "A" system is to provide other phase transformations. For instance, according to the dot-dash lines of Fig. 2A, there are shown three distinct two-phase systems; also, Fig. 3 shows the "A" system converted to give one two-phase and one quarter-phase (at times called four-phase) system, respectively. In all, *five* distinct two-phase systems are derived from the "A" system and its modification. Moreover, by the reversal of one leg (from the point of the closed polygon connection) a two-phase system is obtained from two or from three of the phase-windings; one leg forms one of the two phases, and the other phase is the resultant of the *n* winding and one leg extension—the same two-phase relation can be obtained when the *n* winding is disconnected.

The "A" system can be divided into three distinct phases of application, namely :

(1) . . . A conversion of the "V" or open-delta system of Fig. 1 into the "A" system shown in Fig. 1A. By this conversion, simultaneous delta and star supply may be taken from the primary and/or the secondary sides.

(2) . . . A conversion of the closed delta system of Fig. 1B to the "A" system of Fig. 1A. Also a conversion to Fig. 2 or Fig. 2A for the purpose of increasing the line voltage on any one or both sides of the system without changing existing phase relations, etc., etc.

(3) . . . Direct use of the "A" system for two-phase and three-phase service or for conversion to a quarter-phase system (see Fig 3) by having the two legs form a double open-delta or star with $\frac{1}{2}n$ winding (or $\frac{1}{2}n''$ winding connected in multiple).

Comparing the "A" system of Fig. 1A with Figs. 1 and 1B, the following remarks will serve to point out a few of the outstanding points in favour of the "A" system :

A symmetrical three-phase 4-wire system is obtained.

It provides a true neutral point.

Compared with Fig. 1B, less total winding is required.

It permits of a safer system from third harmonics as compared with the "V," and a three-limbed polyphase unit may be used.

Maximum voltage to earth is brought to a minimum on all phases —i.e., to 29% less than the delta or "V."

It requires four wires only, as compared with six or seven wires for Fig. 1B, which latter has a less balanced lighting service.

Better protection is offered and means for maintaining same.

It combines three distinct systems into one—namely, the delta, the star, and the "A" system, all of which (or combinations) can be operated in parallel.

A satisfactory, simple and cheap means is provided for changing to a higher standard voltage without phase displacement from the original system.

Judging from the above remarks, it is apparent that the "A" system has certain advantages over both the delta and the "V" systems. It is also apparent that, where the delta or "V" system is employed and a higher line voltage is desired, it may be more advantageous to change to the "A" system than to the "Y" system. Apart from a better standard voltage derived as compared with conversion from delta to star, the same delta connections are retained and left undisturbed, so that operation may continue without interruption of service or rush or extra cost of the change over, etc.

Comparing the delta of Fig. 1B with the "A" system of Fig. 2 we have the following outstanding points showing where the "A" system is likely to be preferred :—

Existing star and delta-connected single-phase units can be used to increase the line voltage in steps of 50%, or in steps of 100%, as shown in Fig. 2A.

Using Existing Transformers.

Full use can be made of existing transformers, whereas all existing star-connected transformers (connected to the delta lines) cannot be used when the delta system is converted into a higher-voltage star system.

A minimum additional transformer kVA capacity (one-third more winding) is required to convert the delta to the "A"

Digitized by Google

system and increase the line voltage by 50%. For high-voltage systems where first cost, interruptions, etc., are censurable, the "A" system conversion from delta will be found advantageous in many ways.

There need be no change in line insulators, etc., for a 50% increase in high-tension line voltage because the maximum voltage to earth has not been increased above that of the delta shown in Fig. 1B; the voltage increase of 50% is usually all that is necessary, and it is safer than converting to the star connection.

The phase relations are not changed, hence parallel operations of existing delta and star connections are not disturbed.

As the "V" connection permits of only 86% kVA capacity of each two-unit bank, the difference in kVA capacity from normal can be credited to the "tie" unit *n*, required for the "A" system.

Where the "V" connection is in common use, and where the primary or secondary is one of the lower distribution voltages, the "A" system should prove of special usefulness when it is required to change to a higher standard voltage on the primary and/or secondary.

As the standard and more commonly used single-phase voltages are either 110, 115 or 230 V, it is seen that the lower voltage can be changed to the higher standard of 220 V for a minimum of changes and system interruption, etc., and such a conversion offers a system of greater adaptability and flexibility than the star system.

As the standard and more commonly used three-phase voltages are either 220, 230 or 460 V, it is seen that the low standard voltage can be changed to the higher standard of 440 V with a minimum of changes, etc.

For combined light and power service the "A" system will supply power from the lines or from the closed delta, and lighting from the star.

No Idle Spares.

If there is a spare unit, there is no necessity to leave it standing idle; it may be connected across the two open ends of the "A" legs to help pay for itself, and still act as a spare unit which can be moved and used when and where it may be required.

By changing, say, a 2 200 or 6 600 or 44 000 V delta to a 3 300 or 10 000 or 66 000 V "A" system, not only provides for standard line voltages but for a change with a minimum of service interruptions and with automatic provision for increased transformer kVA capacity; the star system must use three additional phase-windings to provide for an increased transformer kVA capacity as compared with two half additional phase-windings for a 50% voltage increase for the "A" system. For a large group of transformers there is a disadvantage, but this is more than offset by the odd line-to-line voltage when converting from delta to star. See column (3) of tabulation of system voltages.

Increasing the voltage from delta to "A" system permits of either a gradual or a complete change-over, because the original system phase-relations and voltages remain (see column (6) of tabulation); for the star system a sudden and complete change-over must be made because of the total change in voltages and phase displacement—cases will arise where these do not occur, but general conditions must be taken for proper comparison.

An increase in transformer kVA capacity for the star system requires three phase-windings, whereas an increase of 100% phase voltage from delta to the "A" system (see Fig. 2A) requires two existing delta phase-windings, and one existing star winding to make *n* equal $2n=n$"; thus, an increase from a delta secondary of 100 or 200 V to the "A" system gives 200 or 400 V between phases and 115 or 230 V between any phase and neutral, and requires two single-phase units of the former, and one single-phase unit of the latter, which, latter are made obsolete when converting from delta to star.

Differing from the star system change-over from the delta system, the "A" system is capable of expansion and/or conversion to suit the primary or/and the secondary, and for the two ratios of voltage increase to conform directly with the inherent "A" system changes.

Where the delta-star or star-delta system is used and it is desired to raise the line voltage on the delta side, certain advantages and flexibility, etc., are sacrificed by converting to the star-star system unless a tertiary delta winding is also used. Converting the delta to the "A" system retains advantages of both the delta and of the star systems.

On the American continent, in particular, the "A" system should find its widest field of usefulness.

POLE TRANSFORMERS.

Units with a Novel Form of Tapping Unit.

THE arduous conditions under which pole-mounting transformers are employed are amply provided for by British makers of this increasingly necessary equipment. The accompanying illustrations show Peebles transformers,

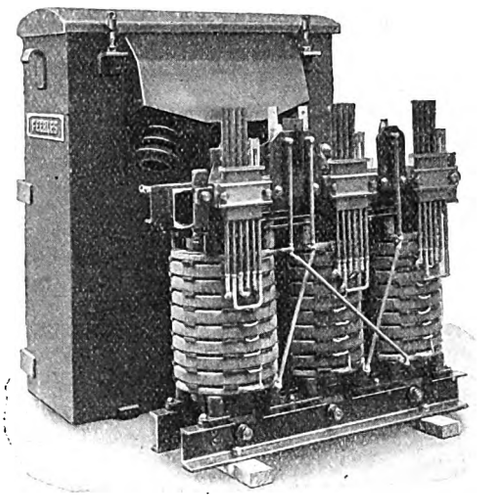

Fig. 1.—A 15 kVA three-phase 50 cycle 11 000/415-240 V transformer, showing h.t. side fitted with Peebles patent tapping units. Tank fitted with improved design of h.t. terminal insulator.

made by Bruce, Peebles and Co., Ltd., of Edinburgh. These units have detachable hangers and fixing shafts arranged to stiffen and act as guards for the base and sides. The terminal arrangement entirely dispenses with the use of compound, either for locating the porcelains or ensuring water-tightness. Connections can be made to h.t. or l.t. cables or base conductors without removing the tank cover. The ingenious design of the h.t. cable socket permits of the cable being held in position with one hand, whilst the fixing screws, which cannot fall out, are tightened with the other.

Petticoated insulators dispense with the use of insulated tails, and the setting of the insulators in a special terminal pocket gives freedom from flashover or bird trouble when bare conductors are used.

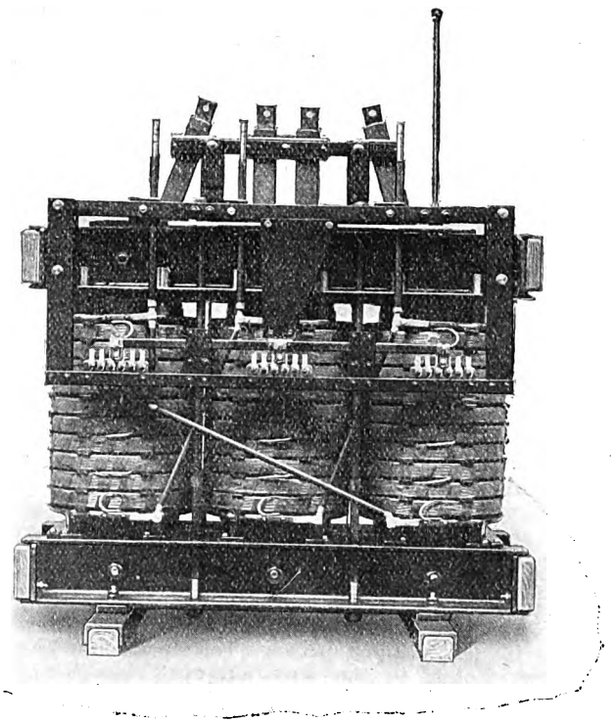

Fig. 2.— A 200 kVA three-phase 50 cycle 6 600/415-240 V transformer showing h.t. side fitted with Peebles three-phase "off-load" tapping switch.

In order to preserve the symmetry in ampere turn distribution between h.t. and l.t. windings, all tappings are brought out at the centre of the windings. A patented form of h.t. tapping unit provides a neat and compact fitting.

ARTIFICIAL DAYLIGHT.

Its Increasing Use for General Lighting—Some Fallacies Exposed—Some of the Applications of "Modified Daylight"—Eliminating Colour Glare.

By "LIGHTING CONSULTANT."

AN important development in the modern science of illumination is the increasing use of artificial daylight, both for general lighting as well as for special work where accurate colour recognition is an essential at all seasons of the year.

Until a few years ago the general conception of artificial daylight, amongst electrical engineers, architects and laymen, was that its only utility lay in the matching of colours. Even this use was considered doubtful, owing to the number of inaccurate so-called "daylight lamps" in use, and greater reliance was placed on natural daylight, in ignorance of its constantly changing qualities and intensities. Even where one of the only three types of lamps that might be described as accurate was in use the high absorption was always referred to as militating against their general application, as also the factor of "coldness" due to comparisons with the bright yellow of uncorrected light, which gave rise to a peculiar semi-psychological objection.

Current Misconceptions.

These objections were generally based on an entire misconception of the facts involved, and were in large degree given rise to by the wrong use to which the first artificial daylight lamps were put. It was also not generally realised, even amongst firms who specialised in this type of lighting apparatus, that two distinct degress or types of correction were necessary, one for accurate colour work, which reproduced the reflected light of a natural "north sky" and another for general illumination where the degree of correction was not so high, approximating to diffused sunlight, and the absorption, in consequence not so great, thus giving the greatest possible amount of luminosity consistent with the reduction of the red-orange excess in the spectrum of uncorrected electric light.

These errors are, in fact, perpetuated to the present day, as various artificial daylight lamps are still marketed that claim to produce an accurate light for colour work with sufficient luminosity for general illumination. The fallacy involved is obvious, as it is practically axiomatic to state that the more efficient an artificial daylight unit may be from the point of view of luminosity, the less its utility for accurate colour recognition, and *vice versa*.

The importance to colour and textile industries of an artificial daylight lamp which reproduced with absolute fidelity the spectrum of the reflected light of a north sky was conceded both by physicists and colour workers many years ago, and the general adoption in these vocations in life of the most scientific unit of this kind, the invention of the well-known Birmingham scientist, Mr. F. E. Lamplough, has sufficiently proved the inherent necessity for such a lamp, which remains a constant source of reference throughout the year, and renders a colour firm independent of climatic and seasonal changes.

The necessity for the application of a more modified form of artificial daylight to general illumination purposes was, however, not so obvious, and even now is grudgingly conceded, owing to the little research that has been carried out on the momentous questions of glare and visual acuity, except from the standpoint of uncorrected light.

The subject is too complicated and involved to be dealt with even cursorily in this article, and to-day, after years of debate amongst the most competent authorities, no generally acceptable definition of "glare" exists. At the risk of rushing in where angels fear to tread, the writer would suggest that this is because "glare" is purely an individual sensation, partly physiological and partly psychological in character, which is largely influenced by a person's colour vision. There are, however, factors in the sensation of "glare" which are common to each person's experience, and the principal of these, taken in their order of importance, are (1) colour; (2) intrinsic brilliance of the light source; and (3) contrast.

Should this assumption be correct, and the experience of the last few years suggests that there is little reason to doubt it, a modified form of artificial daylight, which corrects the colour of the light and gives sufficient diffusion of the light source together with an adequate polar curve of light distribution, must obviously be the only means of successfully defeating the evil of glare which takes such enormous annual toll of industry in inefficiency, reduced output and absentee lists due to visual fatigue and the nervous ailments it engenders.

There is strong evidence available that business circles at large are coming to this conclusion, and experience shows that the *correct* installation of an artificial daylight system, giving a reproduction of natural diffused sunlight—*not* "northlight"—with a graduated ratio of luminosity commensurate with the type of work being performed in order to produce the highest visual acuity, *does* eliminate glare and increase efficiency.

The difficulty involved in this statement of fact, borne out by the use of modified artificial daylight in thousands of business houses embracing every type of profession or industry, lies in the words "*correct installation.*" The procedure so usual in these days, as in the past, amongst architects and consulting engineers, of making a wattage allocation and spacing out light points on conventional lines to harmonise with supposed architectural requirements, without any conception of the polar curve or light distribution of the unit ultimately chosen, often has disastrous results. Gaps or drops in intensity on the working plane, owing to faulty spacing and inadequate candle-power for the processes involved, are not so immediately noticeable with uncorrected electric light as they are with artificial daylight, owing partly to custom and usage, and partly to the effect on colour vision of the comparatively novel conditions introduced.

Failures such as this, which have occasionally attended the use of artificial daylight, even when the type of unit employed was not itself to blame, as often happens, can always be attributed to the almost complete absence of knowledge of the physics of light and laws of colour vision amongst any but physicists and specialists. The time has, in fact, now arrived when an electrical engineer must be a physicist as well as an expert in electricity, if he is to keep pace with the march of scientific progress, and the necessity for a course in illumination to be included in the curriculum of the Institution of Electrical Engineers is becoming increasingly obvious.

Unsuitable Applications.

One can hardly blame the layman for ignorance of the laws of light, but one can most certainly blame the lighting engineer when a "daylight" lamp, which gives a faithful reproduction of natural "north" light is used in a room with yellow walls and green doors, or on a silk or hosiery counter under the glare of hundreds of uncorrected lights. It can hardly be wondered at if the results of matching under such conditions are inaccurate, but it is *not* the fault of the lamp.

Or again, if the colour values given by the daylight lamp do not correspond with the "daylight" of the sunlit street outside, in which every conceivable colour element from brick walls and other materials may be present, is it fair to attribute discrepancies to the inaccuracy of the lamp rather than to the lack of knowledge of the varying spectral intensities of daylight itself, complicated by colour reflections from every possible source? These constitute some of the difficulties that the most accurate of daylight lamps labour under, and can be laid at the door of the lighting engineer who does not acquaint his clients with the correct use and application of the units he supplies, owing generally to his own ignorance of the subject.

In regard to the general utility type of artificial daylight lamp the only satisfactory kind is one, as has been said before, that produces the spectrum of natural sunlight, which has more red or "warmth" than "northlight." Such a filter, the best known and most used of which is also associated with the name of Mr. Lamplough, will have an absorption of about 50% of luminosity, and must therefore be used in conjunction with a two-ply opal or metal reflector.

It is this feature of absorption that has led to the greatest objections being raised against the use of artificial daylight, even of the "modified" type, on account of the supposed increase in maintenance costs that must result. These objections are again based on incomplete knowledge of the facts.

Digitized by Google

Given the necessity for diffusion of the light source in order to avoid "direct glare," some type of enclosed opal fitting must be used, and is, in fact, being used increasingly these days. Yet practically every type of enclosed opal unit used for lighting has an absorption which may vary from 20 to even 60%. Why, then, is no objection raised in regard to this form of unit? When it is further realised that the artificial daylight unit, with perhaps only slightly more absorption than the plain opal type, produces a light which is far superior in the quality of visual acuity, this objection becomes even more ridiculous and unfair.

The production of high visual acuity is, in fact, one of the greatest arguments in favour of the use of modified artificial daylight, and yet it is scarcely ever thought of or understood by the average electrical engineer. Very little blame can be laid at his doors at the moment, however, in the absence of authoritative tests, and the various conflicting opinions expressed by many presumed experts on the subject.

There has indeed been very little research in this vital matter, and where there has, the issue has been confused by the use of uncorrected light alone as the basis of the conclusions arrived at. On the other hand, it has been suggested by those who have had many years of experience of artificial daylight, and is supported by the strongest evidence, that, on the average with normal eyesight, the visual acuity produced by modified artificial daylight of the type referred to above is in the ratio of 2 : 1, when compared with uncorrected electric light of equal candle-power. Since it is on high visual acuity that the rate of production depends, especially in fine processes that demand great visual concentration, the importance of this quality of artificial daylight to industry at large can hardly be overrated.

There is, indeed, little doubt, in the light of some years of experience and practical test under working conditions, that it is this quality of high visual acuity, combined with the elimination of what may be termed "colour glare," that is leading to the increased use being made of modified artificial daylight in business houses, as is instanced by its adoption for so many new city buildings.

But industry, and efficiency in industry, depends upon the recruits to its ranks furnished each year by the schools, and more especially the secondary and technical schools under the control of local authorities. It is in institutions such as these, and in the Education Boards that control them, that serious and measured consideration should be given to a system of lighting that appears definitely to be combating and defeating the menace of eyestrain and deteriorating vision which is converting the nation into a race of myopes.

AERIAL CABLE UNIONS.

A Novel Splicing Device for Overhead Line Conductors—Saving Time in Field Work—Ease of Disconnection—Method of Assembly.

A RANGE of cable unions of novel design for splicing copper, aluminium and steel cored aluminium strands has been put on the market by British Insulated Cables Ltd., of Prescot, Lancs.

This union has been specially designed to give maximum efficiency, both electrically and mechanically, with due regard to simplicity in assembly under field conditions, and without the necessity to use special tools.

The design for steel cored aluminium, as illustrated on this page, is an adaptation of the well-known principle of cone-type wedges so constructed and applied as correctly to proportion the stresses in both the steel and the aluminium wires, thus giving, according to the makers' claim, 100% conductivity and 100% mechanical strength of the complete stranded conductor. It is claimed that with this device joints can be made in the field in half the time required by earlier methods, two ordinary spanners being sufficient to tighten up.

The design, which is patented, has the further advantage that the line may be disconnected, if required, by releasing one nut, without disturbing the wires of the strand or the clamping devices. In fact, it may be uncoupled and coupled up again as simply as an ordinary pipe union.

The unions for use with plain copper and aluminium strands are very similar in design. They are claimed to give 100% conductivity, and not less than 95% of the mechanical strength of the stranded cable.

Examination of the sectional drawing in Fig. 2 shows that each half of the joint is made by means of four cones, the two parts of the joint being held together by a screwed nut.

To assemble a joint it is necessary to bind and saw the end of the cable, and, having slipped the largest cone through the nut, put both over the cable end. The binding wire is cut and the nut and cone slipped along the cable. The cable is then bound approximately $3\frac{7}{8}$ in. from the end, and $1\frac{7}{8}$ in. is cut off the outer layer of the aluminium strands and $\frac{1}{4}$ in. off the inner layer. The steel core is bound and a second, smaller, cone pushed on the end. The steel core binder is removed and the inner layer of aluminium strands is cut off level with the outer layer. The second cone is pushed along

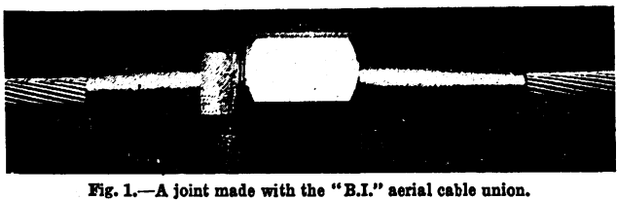

Fig. 1.—A joint made with the "B.I." aerial cable union.

the steel core, over which a further cone is pushed. Then the binder is pushed back another $\frac{3}{4}$ in., the aluminium strands are carefully lifted, and the second cone pushed along the steel core until its large end is flush with the ends of the aluminium strands. The third cone is then pushed up to the second cone.

The two halves of a fourth cone are next inserted over the centre strand of the steel core, and pushed into the third cone as far as possible, care being taken that none of the six outer strands of the steel core get into the grooves between the two

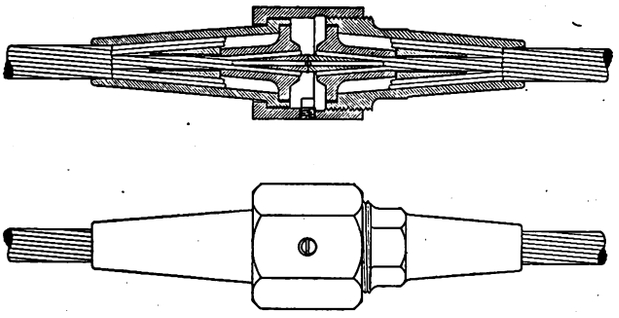

Fig. 2.—Showing the method of joint assembly with the "B.I." union.

halves of the fourth cone, which is finally driven up into the third cone with light hammer blows. The binder is then cut, and the outer cone slid as far as possible up to the end of the cable before releasing hold of the aluminium strands, and the nut and cones are pulled up to their final position.

Assembly of the other half of the joint is proceeded with in exactly the same manner. The two halves are firmly screwed together with the nut, the joint is filled with compound through the hole seen in the lower part of Fig. 2, and finally sealed with a plug provided for the purpose.

OFFICIAL STATISTICS.

THE complexity of modern civilisation demands an increasing knowledge of the organised activities of the community and the social phenomena to which they are related. Recognition of the importance of statistics, as the most convenient means of acquiring this knowledge, has proceeded apace, but it often happens that the inquirer has to discover for himself where the desired information can be obtained.

So far as official statistics are concerned, this requirement is met by the "Guide to Current Official Statistics." This compact publication not only gives a list of volumes containing statistical information, but also provides a detailed index of subjects, in which are indicated the exact characteristics of the statistics to which reference is made. Special devices are employed to facilitate the use of this index by the most casual inquirer, and to enable the appropriate reference to published statistics on any subject to be traced. Volume VII of the Guide (price 1s. 4d., post free) has just been issued, and may be obtained from H.M. Stationery Office or any bookseller.

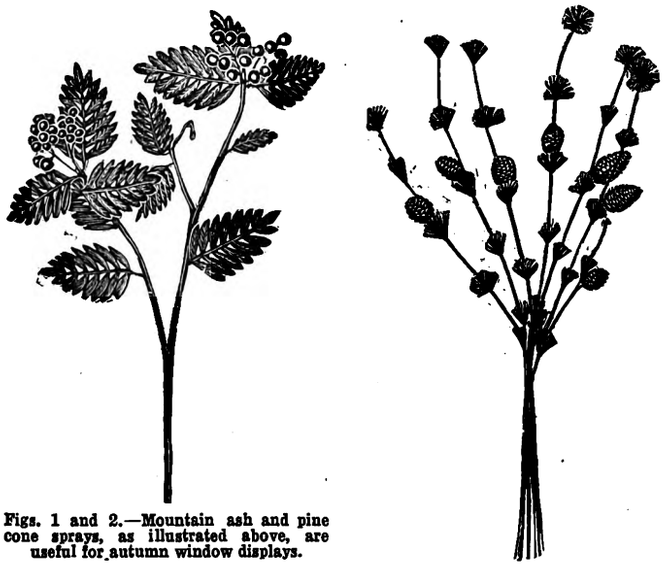
AUTUMN WINDOW DISPLAYS.

Seasonable Effects for the Contractor's Window—Armistice Day Displays—Preparing for Winter—Natural Colouring.

By A. EDWARD HAMMOND (Author of "Shopfittings and Display" and "Practical Aids to Retail Selling").

IN THE ELECTRICIAN of September 28th, 1928, I said, "It is surprising how few electrical contractors take advantage of the excellent opportunities afforded by the autumn months for seasonable window displays. With the holiday season over, and the winter approaching, there should surely be every incentive to attract the interests of the public to new lighting and heating equipment, not to mention wireless."



Figs. 1 and 2.—Mountain ash and pine cone sprays, as illustrated above, are useful for autumn window displays.

Whether or not my article had any influence I do not know, but I was interested to notice that both in London and some half-dozen large provincial towns there was an increase in the number of contractors' windows and supply authorities premises in which special autumn displays were arranged. But I do not feel justified in taking any of the credit, for there has been a tremendous advance in electrical window displays of recent years. The British Electrical Development Association is doubtless largely responsible, for the effect of its display activities has been generally to uplift the standard of electrical display, and the pioneers of this association's display service builded better than they knew when they laid the plans for assisting contractors with their window displays. It has had a repercussion in this respect, that although there are still many contractors who do not avail themselves of the help proffered, a good proportion of these traders are now employing improved display methods of their own, and are making regular window changes.

To return to autumn displays, the contractors' windows are of vital importance at this time of the year because everybody's indoor activities are necessarily more limited during the summer months; but people generally return to them with renewed zest at the onset of the longer, darker evenings, and this is the theme the contractor might well play upon in arranging his winter campaigns.

Seasonable Appeals.

In preparing his window display plans for a particular period, as I pointed out last year, the first matters for an electrical contractor or the display man in an electrical showroom to consider are seasonable appeals.

October and November are not rich in either; but there are several special days which provide him with excellent opportunities for introducing seasonable and topical features into his display. I explained last year some ideas for displays for Midsummer Day; October 1st, beginning of shooting season; and October 21st, Trafalgar Day; but there are three other important days that should not be overlooked.

November 5th is Guy Fawkes Day. Some contractors might make this a good opportunity for introducing special displays appealing to children, with a view to attracting the attention of their grown-up companions. Such a display might have a painted background suggesting fireworks, and/or illuminated effects by means of coloured spotlights and floodlights; a "firework display" worked by "flashers" is also an attractive possibility.

November 9th is Lord Mayor's Day in London, and the day on which new mayoral appointments are made in most of the provincial towns. For such an occasion, displays in which reproductions of historical pictures of local interest were featured, or wording introduced with a bearing on the civic events, would probably have the effect of arousing considerably increased local interest, and would set passers-by talking, and thus bring the contractor's or supply authority's name into prominence in connection with local activities.

An Armistice Day Plan.

November 11th, Armistice Day, suggests itself for a restrained display, with Flanders Poppies forming a prominent feature. A few selected items could be arranged against a black setting or on a black covered window base, relieved here and there by a few scarlet artificial poppies and a card bearing the appeal "Wear a Flanders Poppy" placed on an easel in the centre or at one side of the window.

For the window of an electrical supply authority's showroom something on rather more pretentious lines might be arranged. One display theme which suggests itself is an adaptation of the "pictures in the fire" idea, with the window setting arranged as the hearth end of a drawing room or simple parlour. An electric fire in one corner, with a suitable surround and wall carried out in window dressing paper (this can be obtained in rolls representing numerous varieties of interior decorative treatment). A seated woman's figure (in *papier maché* or composition) holding a photograph, and on a small table near by a row of medals. Across the back, or on the window base, scarlet poppies could be pinned to spell the word "Memories," and a neat card placed unobstrusively on the opposite side bearing the words "Buy a Flanders Poppy."

An electric reading lamp might be placed on the small table, and this, with the glow of the electric fire, should provide all the lighting. No top illumination should be used, except perhaps one floodlight throwing a ray on the tableau.

Autumn leaf sprays can be obtained in dozen lots in two sizes 20 in. and 27 in. high respectively, and seasonable artificial flowers, such as chrysanthemums, gladioli, jasmine, lavender, heather, mountain ash (with berries), pine (with cones), and cape gooseberry, in sprays in single or dozen lots, are also procurable from the firms specialising in display accessories.

The mountain ash spray shown in Fig. 1 is naturally pro-

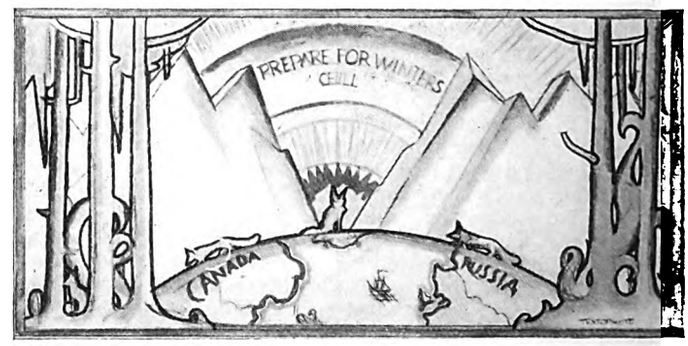


Fig. 3.—A scenic background in which colour and light could be effectively combined in a window display of electrical heating appliances.

duced in cambric, and is 24 in. high. The real pine cone spray in Fig. 2 is 22 in. high. (Both of these are reproduced by courtesy of Messrs. Dudley and Co., Ltd.) Then, strips of artificial variegated autumn leaves, 36 in. long, may also be obtained in dozen lots. These can be used with attractive effect in various parts of the window. Window dressing papers representing various autumn settings can be obtained in rolls measuring 12 yd. long by 22 in. wide.

A topical element can be brought into the window by warning people of the rapid approach of winter, and of the need for being prepared in advance for sudden cold spells even before winter commences, by installing electric heating

Digitized by Google

equipment which enables them to heat a room quickly on the cold evenings which so frequently follow a fairly warm day, and to avoid the labour and dirt caused by lighting a fire.

Electrical contractors anxious to improve their window displays will find it possible to seek inspiration from many sources. The range of subjects which they can adopt and adapt for use as special window features is inexhaustible. Much of the modernist display work seen at the moment is inspired by the present day trends in architecture, and there have been several developments recently which seem to suggest the builders' merchant's yard as a happy hunting ground for ideas.

One material which has been used by many well known stores is an "art" metal similar to silver plating in appearance. An advantage about this is that it can be adapted to individual requirements of shading and design after erection. Display stands are now produced in this material with an oxidised silver finish. The metal is treated by a patented chemical process which allows for the incorporation of any design or symbolic motif. The flat surfaces can be shaded, blended, or graded to any tone desired, and may be given an oxidised, silver plated, matt, burnished, or crystalline finish.

Another popular new display material takes the form of a specially treated flexible wood supplied in strips. This can be bent to any desired design by the aid of a block supplied for the purpose. It stays in this position until straightened out again, and can be used repeatedly in different ways. Screens and panels can be produced in these flexible strips as well as display stands, and it might also be employed as applied ornamentation for the window enclosure.

Corrugated iron has been used, both in this country and America, for display settings. The corrugations lend themselves well to modernist effect, and can be painted to blend with other display features. In this connection, it is interesting to note that corrugated strawboard is now being used for showcards. The two in conjunction seem to suggest possibilities.

More recently still, iron piping has also been employed for display purposes. One trader had a series of windows with iron piping forming part of the setting. The design consisted of a central arch with two half-arches on either side. Small corner unions and "I." and "T" shaped and fourway unions were employed with universal threads, so that varied shapes and designs were made possible. Piping may be finished in any colour, or given a bronze, aluminium, gold or silver finish.

These materials are all very inexpensive, and with a little ingenuity easily adapted to the contractor's requirements. If he has a cellar or small back room available for experiments, so much the better.

The Sculptor's Aid.

Now, an even wider departure has been made from the conventional idea of display sources, for recently one firm of retailers decided to go outside the display and shop-fitting world for new ideas in window fittings, and accordingly sought the advice of a well-known sculptor who designed the Great Seal of England and was responsible for the design of the Irish Free State coinage.

The idea of employing a sculptor to design window fittings seems very much in keeping with the modernist spirit. Many of the modern commercial buildings have their façade enriched by sculpture. One example very much in the public eye at the moment is the new building for the headquarters of the London Underground, where two eminent sculptors have been employed in carving *in situ* symbolic figures representing "The Four Winds" and "Night" and "Day." One of these sculptors—Mr. Eric Gill—has also been consulted by a retail organisation, for he designed the lettering used on the fascia of the shop-fronts of a well-known multiple concern.

Cubes and blocks are becoming more popular for display purposes. An American firm of display specialists has recently designed complete window sets of these blocks, made of heavy fibre board in three finishes: dark walnut veneer sides, natural veneer tops, and black bottoms; pebble finish silver sides and tops, black bottoms; pebble finish gold sides and tops, black bottoms. One set consists of two units 9 by 9 by 24 in., two units 9 by 9 by 18 in., two units 9 by 9 by 15 in., two units 9 by 9 by 6 in., two plateaux 18 by 18 by 9 in., and one plateau 21 by 21 by 6 in. An infinite variety of arrangements is possible with this set.

Another set of blocks for smaller windows, or where only a small unit is wanted for the centre of a display, is made in the same materials and finishes. This set comprises one unit 9 by 9 by 24 in., two units 9 by 9 by 18 in., two units 9 by 9 by 9 in., one unit 9 by 9 by 15 in., and two units triangular in shape, one-half of a 9 by 9 by 9 in. cube.

Several traders have found the luminous blocks now available wonderfully adaptable for display purposes, for they provide a means of incorporating light into the display as a decorative feature as well as an illuminant, and for this reason they seem particularly suitable for use in conjunction with displays of electrical fittings.

Another new material which has been brought to the front recently in connection with display is aluminium. Display fittings are now made in this, and also in a light alloy of aluminium known as "Duralumin" in which magnesium and copper are important components. Aluminium is the lightest of the common metals and as such suggests itself for the dainty fittings associated with modern display.

I have made reference in previous articles to the value of scenic backgrounds as a means to effective display. Fig. 3 shows a suggestion for a seasonable setting of this description, in which colour and light could be effectively combined. Backgrounds of this description are produced in specially prepared linen, and can be illuminated in sections. The illustration is reproduced by courtesy of The Textophote Display and Advertising Co., Ltd., 11, Berkeley Street, London, W.1.

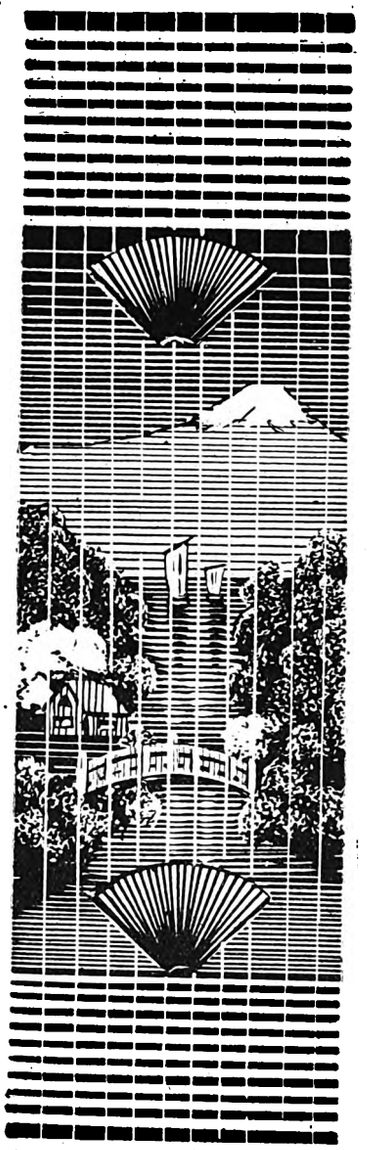

Fig. 4.—A suspensible setting suitable for use in open-backed windows.

One form of window setting recently introduced is suitable for use in open-backed windows or as a temporary covering for a fixed window enclosure, for it can be suspended on cord from the top of the window or lightly tacked to the wood framing of a glass or wood panelled enclosure. This takes the form of panels of split cane, finished in a variety of designs and colours. The standard measurements are 48 in. long and 14 in. wide. An example of this form of window background panelling is shown in Fig. 4, by courtesy of Messrs. J. C. King, Ltd.

There is a matter to which the electrical contractor should give particular attention at this time of the year, and that is the prevention of condensation on his window glass. "Steamy windows" are the bugbear of many retail traders during the winter months; but there are now quite a number of devices for preventing the results of condensation.

Among these devices are special electric tubular heaters. The contractor who has to face condensation difficulties should make a point of using one of these appliances. It would provide him with an effective demonstration.

The tubes are light and compact, and are made in lengths of from 2 to 8 ft., finished in a copper bronze, which renders them unobtrusive. The heating element is entirely enclosed within a heat-resisting insulator, which, in turn, is protected by the outer tube.

Another useful device performs three functions: it serves as an electric sign, it illuminates the window, and it provides a warm current of air which ascends the inner surface of the plate glass and thus nullifies the effect of the cold air outside and the hot air inside coming into contact.

SHOWROOM EXTENSIONS AT CARDIFF.

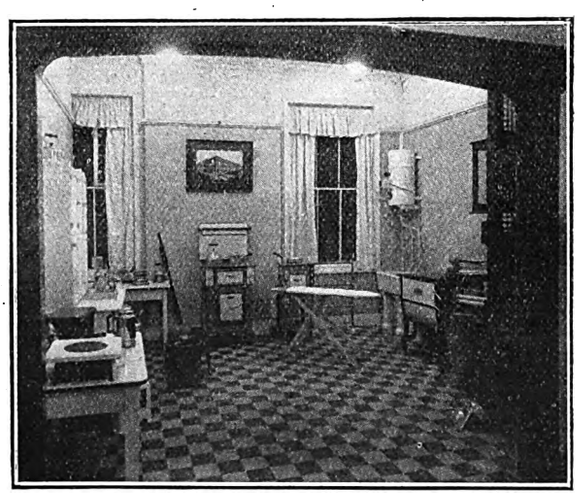
Formal Opening of Enlarged Premises by the Lord Mayor—New Demonstration Facilities for Domestic Appliances and Radio Goods.

CONSIDERABLE extensions have recently been made at Magnet House, the headquarters of the Cardiff branch of the General Electric Co., Ltd. The newly extended premises which were formally opened by the Lord Mayor of Cardiff last Thursday, are situated in the centre of the city, and have their main entrance in Castle Arcade, with trade counter entrance and goods receiving and despatch sections in Womanby Street.

One of the attractive lighting fittings showrooms at Magnet House, Cardiff.

This branch serves a very wide area and covers the whole of the Welsh coalfields, and the many industries allied to the coal trade within and without the Principality, including the whole of South Wales, Herefordshire, Gloucestershire, Somersetshire, and the greater part of Wiltshire. The growth of the business has been so rapid that the important territory of which Plymouth is the centre, which formerly was within the area served by this branch, has now been allocated to the Plymouth branch, and this is particularly pleasing in view of the depression that has existed so long in the territory served by the Cardiff branch, because it does show that while depression may exist in certain industries, improvement in others is no less rapid.

When the Cardiff branch was opened, 29 years ago, it was only of small dimensions. The staff numbered exactly two, consisting of one office boy and one warehouseman. Mr. W. G. Phelp, now managing director of the British General



A corner of the household appliances showrooms.

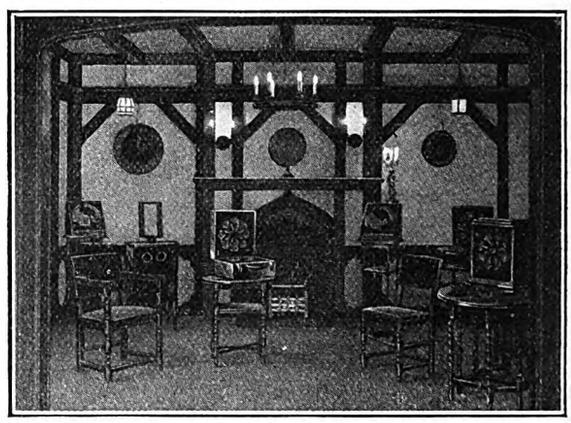
Electric Co., Ltd., of Johannesburg, was in command. From this small beginning the branch has been developed to its present flourishing condition.

In 1900 a certain amount of opposition was offered by electrical contractors in the district, due to the belief that the enterprise would take away their trade, but actual experience of the working of the G.E.C. trading policy, soon proved these suspicions to be without foundation.

The old premises were situated on the canal side, and besides being subject to flooding at certain times of the year, their position was so exposed that, on two occasions at least, the roof was blown off. Thus it became necessary to secure fresh premises, and in 1906 a new G.E.C. home was established by the side of the present premises in Womanby Street. Since 1906 these have been extended no less than six times by taking over adjoining property as the various occupiers' leases expired. Success attended these various extensions, and business and staff increased very considerably. In 1903 Mr. W. E. Hobbs, the present manager, took over command, and under his guidance the business has continued to develop ever since. The staff to-day numbers approximately 200.

So successfully did business develop that it eventually became necessary to open sub-branches to serve the important industrial centres of Bristol and Swansea; in fact, at the moment of the completion of the main Cardiff branch extensions, the sub-branch at Bristol is about to occupy vastly improved and extended premises, and at the same time the question of extending at Swansea is receiving serious consideration.

The Cardiff premises are now arranged in three separate blocks for management purposes, and general convenience. The centre block comprises the trade counter, a series of showrooms devoted to industrial and domestic heating and cooking appliances, general and industrial lighting fittings,



Part of the radio demonstration rooms at Magnet House, Cardiff.

lamps, radio demonstration showrooms, mining gear, stage lighting and other electrical equipment, wires and cables, and well equipped stores. The north block houses the administrative offices, a travellers' conference room and lecture hall and lamp stores. The south block is devoted to wireless and general stores, receiving, despatch and special express and general transport arrangements. Express goods lifts serve the upper floors.

Electrically the premises are equipped with the most up-to-date apparatus, the main distribution board on the ground floor, which is capable of carrying a load of some 70 kW, serving a number of specially designed link boxes for controlling current supply in the various departments.

The electrical fittings showrooms at this branch are designed on the latest lines to permit the inspection of a wide range of lighting fittings under the most favourable conditions. These fittings are shown in separate groups or rooms. One section is devoted to a display of multi-coloured panelled and moulded glassware pendants, brackets and floor standards fashioned in bronze metal work, oxidized silver, etc. Another section is devoted to alabaster ware, and yet another is devoted to a comprehensive selection of pendants, electroliers, and other types of fitting.

Separate showrooms are devoted to industrial and domestic heating and cooking appliances, as well as general and industrial lighting fittings and demonstrations of lighting. Here also mining, haulage and winding gear, flame-proof switchgear, stage lighting and other electrical equipment for cinemas

Digitized by Google

and theatres, wires and cables, and various apparatus for industrial electrification is on view. Much of this is arranged so that it can be demonstrated in the showrooms, including the Magnet mine signalling system introduced by the company into the South Wales coalfields.

The two showrooms devoted to the display of electric household appliances and wireless goods are equipped on the most up-to-date lines to supply every need of the domestic and entertainment sides of the average household. In the Tudor radio demonstration room speech and music radiated from every corner of the globe may heard under comfortable conditions.

The showroom service is, of course, backed by extensive stocks and a well-equipped trade counter.

ELECTRIC HOMES CAMPAIGN.

Enthusiastic "Send-off" at Area Conference in Manchester.

THE E.D.A. Electric Homes Campaign had an excellent "send-off" at the Manchester Lighting Service Bureau on Monday, when the first area conference was held. Mr. H. C. Lamb, the chief engineer of the Manchester Corporation Electricity Department, who presided, said that the purpose of the campaign was to increase the number of all-electric houses, and to put an end to the construction of houses without adequate electrical service.

Lieut.-Col. W. A. VIGNOLES briefly outlined the objects and the programme of the campaign, and made passing reference to the success of the W.O.B. Campaign of two years ago. He said that the Electric Homes Campaign was likely to become a permanent feature of the work of the E.D.A. Houses were always being built, and the question of seeing that they had sufficient plug-points would always be necessary.

The campaign was to show how electricity could do more than it was doing at present. He mentioned the ways in which the campaign was to make its appeal. It was to appeal to the public through the daily Press, particularly through the housing advertisement columns, and also through the 20-page booklet, "The House You Want," which was largely to be distributed through contractors. They were then to run an advertising campaign through the women's papers and the home papers. Finally it was to make its appeal through trade papers to the builder and the architect. On the question of the E.D.A. wiring specification, it had taken two whole days for the Committee to come to an agreement. The Committee were not satisfied with the word "outlet" and were inclined to prefer the simple word "point." The expression "plug-point" was one which was being considered.

In the discussion which followed, Mr. L. ROMERO said he had every reason to expect that the campaign would be a thorough success. He thought that the name "plug-point" was an excellent solution of the problem, as it combined the idea of position with that of plug.

Mr. A. J. HUTCHINSON, of Farnworth, said that it was all very well appealing to the new homes, but what was to happen to the older houses. Could they not extend the campaign to embrace the older houses? In his own area they were continually extending the supply to streets of old property.

Mr. H. C. HAZEL, of Liverpool, said that he did not think there was much necessity to appeal to the builder and the architect, as they knew all about it. It was to the general public that the appeal should chiefly be made. He knew of speculative builders who were advertising their houses by the number of plugs.

More "Circles" Needed.

Mr. J. F. SIMPSON, borough electrical engineer of Preston, said that in his area there was an average consumption per house of 1 460 units a year. He suggested that instead of "outlet" the word "service-point" should be used.

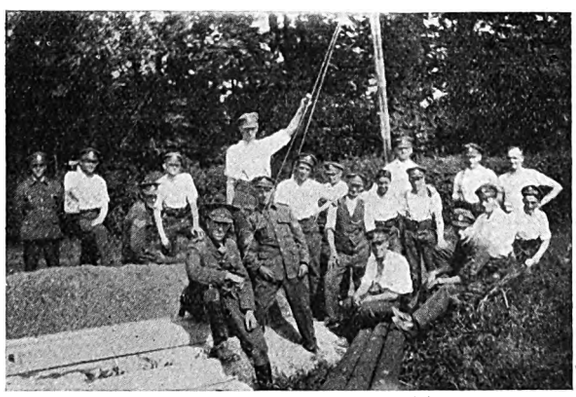
Mr. W. A. SHAW, of Stockport, said that he could heartily advocate E.D.A. as the finest means of bringing all sections of the industry together, and he knew of more than one case where the Association had been the means of the contractor meeting his supply engineer for the first time. He was glad to hear from Mr. Hazel that the builders were making a move in the direction of better electric lighting, as he knew of many cases in the past where the builder had spent more on the decoration of one room than on the wiring of the whole house.

Mr. R. C. HAWKINS, the E.D.A. district officer, said that in the North-Western Area there were five electric Circles, all doing very good work; but five circles were not enough in an area which had 92 supply undertakings. He hoped that more Circles would be formed, and, though he was very full up with lectures, he had kept a few dates open to assist with the formation of any new Circles. He also referred to the good work the area hoped to do at the forthcoming Manchester Smoke Abatement Exhibition.

Miss FOSTER JEFFERIES said that the Manchester Branch of the Electrical Association for Women would give the campaign their whole-hearted support.

Lieut.-Col. VIGNOLES, replying to the discussion, said that they were out to attract the attention of the old householder as well as the new.

ANTI-AIRCRAFT SIGNALS.



THE accompanying pictures, illustrating the work of the 26th and 27th Anti-Aircraft Signal Companies, R.E. (T.A.) in their recent camp at Manston, show (left) constructing a terminal pole by the field signal office, (centre) a detachment after completing a practice line, and (right) another view of work on a terminal pole. These units are responsible for training personnel for providing communications between the searchlights and guns of the London Air Defences. There are vacancies for a few keen recruits with technical ability who will appreciate a thorough and comprehensive training in Army telephony in all its branches. Much of the time available for training during the winter months is devoted to the very interesting problems connected with the manning of an Intelligence Centre for London's Air Defences. The headquarters are at 56, Regency Street, Westminster, and intending recruits will be welcomed any Wednesday evening between 7 p.m. and 9 p.m. Special attention is paid to the social side and recruits are assured of an enjoyable as well as a useful and instructive period of service.

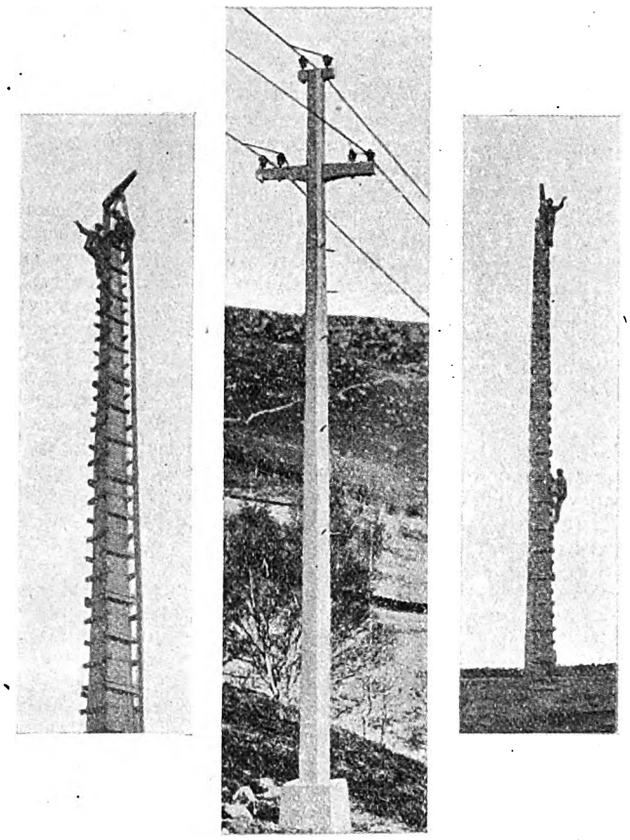
CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

"Concrete Pole Designs and Costs."

[To the Editor.]

Sir,—In reply to Mr. W. Fennell's letter in your issue of September 6th, p. 276, I enclose three photographs showing one of several pole lines built of reinforced-concrete construction where the poles are cast directly in their final positions, i.e., they are cast vertically and directly in their final place of location in the line.



These pictures show (left and right) the method of casting reinforced concrete poles vertically in their final positions in the line. The centre picture shows a completed pole in operation using the ordinary cross-arm construction and double insulators per conductor. Mr. Taylor states that this type of construction conform in every respect to the costs, &c., which Mr. Fennell has criticised.

False impressions or opinions based on lack of practical experience can be best satisfied by facts, but if Mr. Fennell disputes even the photographs shown here, I am prepared to request Mr. Fennell, should he still condemn my claims, dispute the costs, and cry aloud the cautions, to deposit, in a bank to be chosen by an arbitrator, the sum of £1 000, plus 6 per cent. to cover losses incurred in interest, etc., the writer to do likewise, and that, entirely at the loser's expense, Mr. Fennell, the arbitrator, and the writer or his deputy, visit and inspect the various lines, etc., *now built* (and being built) according to the above-mentioned method of construction; that the views of the arbitrator and those of the different electricity supply companies, etc., concerned (respecting the above-mentioned costs, supposed experimental stage, falsity of cautions) be accepted as final, that Mr. Fennell and the writer deposit in advance a further sum of £250 to cover these said expenses, also respectively guarantee to make up the difference if any.

It is worthless and a waste of time and paper to say anything further at the moment, other than to add that all the writer's remarks *stand unchanged*, and that Mr. Fennell's views that "it is possible to use wood for *any* span which could be dealt with by ferro concrete" (which differ from the original) are literally true, but in practice are not only vague and useless, but can be positively dangerous. The original views were answered, and the following still further substantiate them.

Speaking generally (which is the more acceptable and just viewpoint), it is unsound practice unduly to stress any (relatively) rapidly deteriorating and untested and unknown quality material such as timber, also to compare its durability, minimum maintenance costs, the relatively *durable* factor of safety, etc., with reinforced concrete for equal length of span, equal loading and climatic and atmospheric conditions, for the different locations and countries. Steel and concrete poles are inherently intended for heavy constructions, and consequently are best suited to long-span and single (especially *double*) three-phase circuit lines and long-length poles. For relatively light-weight, such as the example given on page 160, and for the most favourable soil and climatic conditions for properly-treated round red fir, the concrete pole line of the writer's proposal would be pressed in the matter of commercial competition for short-span construction, which latter would be both foolish and unnecessary practice, and quite contrary to the reasons for using concrete construction.

Going to specific cases, it may be added that the writer has built lines in several locations and countries where the untreated timber pole would have cost no less than double that of a concrete pole, and in other cases where the life of a red fir pole could safely be reckoned to average little over three years; on the other hand, we can have a specific case where the soil, conditions, location, and careful maintenance are so favourable to the best-treated sound red-fir pole that, after 30 years' continuous service, it can be almost as sound as when first installed—any specific case is of little practical value as a guide, and comparing the same number of wood and concrete poles in a line to equal the strength of the latter would be very much more specific than general to meet the best conditions of practice and economy and safety, etc. The writer scopes the whole world; not only Mid-Cheshire.—I am, etc.,

William T. Taylor.

September 16th.

"Where *Is* That Battery?"

[To the Editor.]

Sir,—My profoundest regrets to "Battery Electric" that I have "contributed nothing to that great question of the battery." I really must see what I can do about it, as it seems to cause him so much concern.

But did I misread his text and his nom-de-plume? Was it not a practical battery-driven automobile which he wanted to substitute for "stink wagons," and was not the battery improvement required solely for achieving this object? If so, surely it is not out of order to indicate that the research is now hardly worth while in this connection. Even electricity supply concerns and electrical contractors run their goods and staff round in "stink wagons," and some even proudly proclaim the virtues of the use of electricity for "everything" on the side thereof.

But this challenge of his is a serious matter. It is stated that we can lower the *average* speed by 10 m.p.h. and get there just as quickly. As the average speed of a battery electric rarely exceeds this amount, I suggest that we make the experiment and see how fast the road traffic goes by standing still!

The poor rich lazy battery makers. They have done nothing but make profits; and, worse still, very largely by equipping "stink wagons" with batteries that are good enough for the job. They have even helped to bring into existence a big and prosperous industry for making all "stink wagons" into partial electrics when they should have been diligently engaged in making batteries to prevent cars from going too fast or from being overworked when they ought to have been in the garage being recharged.

Sir, the "stink wagon" is here, and by its correct title and in its modern form it is a far better car than any battery electric can be, even with the aid of a miracle in battery evolution. But, as an auxiliary, it does want more battery per car, especially for town use, and it is possible that "Battery Electric" may, within his lifetime, see developments in this direction at present undreamed of in his philosophy; and, moreover, the best batteries of the present day will enable this to be done.—I am, etc.,

"Cynicus."

September 20th.

Electricity is effecting a tremendous social change. Families find in the country the natural advantages of unbounded space, healthful living conditions and lower living costs. And to these electricity is adding the other great advantages of light and power and the thousand and one labour, time and money saving inventions that have become a basic part of modern life.—*Mr. G. Dyer.*

AUTUMN TRADE PROMOTION.

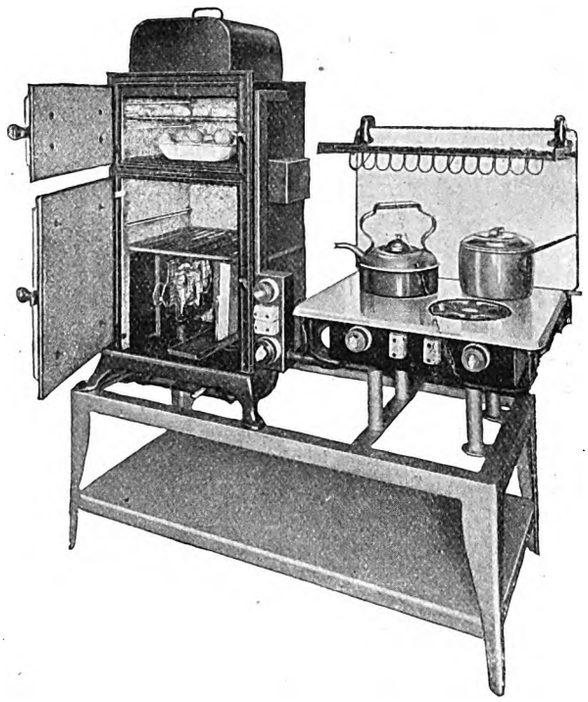
Suggestions for the Coming Season—New Fires and Cookers for the Winter Demand—What the Manufacturers are Offering.

IN order that electrical contractors may form some idea of what is offered for the coming winter trade we give below the suggestions of a number of manufacturers. In many cases the details are of new apparatus, while in other cases the models have been extensively improved.

Three new fires have, for instance, been introduced by SCHLEPER AND SONS, of Amsterdam, and these are illustrated on page 363. In all cases the elements are protected, and a connector with 3½ yards of flexible is supplied with each fire. The elements are 500 or 700 W, according to requirements. The finishes include crystallised black, oxidised silver, Florentine bronze and black spotted brass. The reflectors are made from brass or chromium, according to type.

The "Quead" patented electric cooker manufactured by WILLIAM GEIPEL, LTD., of Vulcan Works, 156–170, Bermondsey Street, London, S.E.1, incorporates the feature of roasting by radiant heat more or less on the old spit system. The joint or bird is hung on a hook and kept slowly revolving between red-hot elements by means of a roasting jack. An automatic baster is provided so that once roasting is started no attention is required; in fact, it is claimed that the door of the oven need never be opened until cooking is completed. The size of the roasting oven is 21 in. by 16 in. by 14 in.; it will accommodate joints up to 20 lb., a large turkey or several fowls or ducks. Baking is done in the top oven, partly by superfluous heat from the roasting oven, and partly by means of a top element which is specially useful for browning. The internal dimensions of the top oven are 9 in. by 16 in. by 14 in.. The boiling efficiency of the Quead boiling-plate is claimed to be higher than that either of other similar boiling-plates or of the modern gas boiling-ring. The element is of the plug-in type. With the 1 100 W plate 3 pints can be boiled in 11 minutes, and two heating spirals are fitted—one rated at 1 100 W and the other at 300 W. The small type boiling-plate has a capacity of 600 W and boils 3 pints in 18 minutes.

Some new types of cooker have been produced this year by the GENERAL ELECTRIC CO., LTD., of Magnet House, Kingsway, London, W.C.2. In their principal points of construction they are identical, the only important variations (except in the case of one) concern their dimensions and capacity. The one exception is the "Magnet Minor" cooker. This is of a type which will appeal by reason of its compactness to occupiers of small flats, bungalows, etc. Each of these new cookers is built up with a sheet-metal body double cased and lagged, and with a close-fitting cast-iron door and door frame. The ovens have enamelled interiors which are rounded at all corners, and detachable shelf-runners are fitted. The ovens can be entirely withdrawn for cleaning purposes. The heating elements are so disposed that side heating or combined side and bottom heating is available. An oven pan, grid shelves and a browning sheet are standard fitments. Between the oven and the top hob-plate provision is made for a hot cupboard and a grilling chamber, the enamelled pan and adjustable grid being removable. Two circular totally enclosed hot-plates 8 in. and 7 in. diameter are fitted, and one of the larger models has a third hot-plate 6¼ in. diameter, which is particularly economical when a small utensil is used or simmering is required. These hot-plates, as well as the oven and grill, are separately fused and controlled by reciprocating



The "Empress" cooker of William Geipel, Ltd.

switches giving "full," "medium" and "quarter" heat, and are guaranteed for two years. They are fitted behind flush insulated cover plates, and fuses of approved H.O. pattern are assembled beneath the hob, being protected when the hob is closed. The standard finish of these models gives mottled grey porcelain enamel for the hob and black stoved enamel for the exterior; the removable oven interior is porcelain enamelled and the door and switch panels enamelled white.

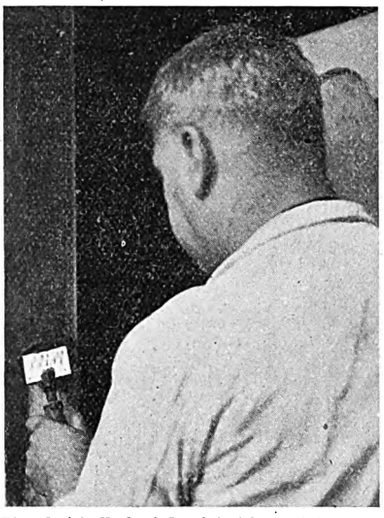
The "Minor" cooker already referred to embodies in the main the foregoing constructive details and finish, but it is intended only for small families, and its dimensions are the result of careful estimation of probable requirements. It seeks to represent the maximum efficiency in the minimum of space, together with an economical rate of maintenance. A distinctive feature of this cooker is that it is provided with separate self-contained units for boiling and grilling, while the grill element, although part of the oven heater, is separately regulated, an additional switch being fitted to control the

A few of the hand-painted shades offered by the Regent Lampshade Co., of Brixton, London, S.W. The material is painted on both sides.

Digitized by Google

bottom heat when required. The hob is fitted with an 8 in. circular hot-plate, with separate three-heat control. A white enamel drip-tray is provided immediately below the hob. Optional fitments to this cooker are a floor stand with a shelf, and a splashguard.

The G.E.C. is also introducing a number of new types of fires. One of these is a handsome sheet-metal fire available in either antique brass or oxidised silver finish, with a load of 3 kW. It is designed for standing in an existing fireplace, the back being of smaller dimensions than the front, so that it will conveniently recess into the grate opening. The control switch of this fire allows for three grades of heat.



The electrically-heated paint stripper, introduced by the Electric Heating Co., is particularly appropriate while the present "house painting season" is in progress.

Two series of these new fires are of the reflector type, with concealed elements mounted in a focal position. The loading of these designs ranges from 1½ kW to 2 or 3 kW. Arranged for half or full heat and being fitted with heat-insulated handles, these models can be moved from room to room and placed in any convenient position. They are finished in bronze colour and one of the series is decorated with oxidised silver facings and ornaments which look particularly attractive against the matt black of the background. Two switches are fitted at one side, each of which controls an element mounted at the base of the hammered copper reflector, while the front panel element is connected directly to the main terminals.

Among the numerous "Magnet" household appliances are one or two specialities which merit special attention by reason of recent improvement in their design or construction. For instance, the "Magnet" iron has been given a superior nickel-plated finish, and the back-rest is now so fitted that the user's hand will not be impeded during work and an auxiliary stand can be dispensed with. At the same time the price has been reduced in the case of both the 4 and 5½ lb. weight types. The "Magnet" kettle, in 2, 3 and 6 pint sizes, is now standardised with an automatic cut-out, which consists of a fusible link which causes the electrical circuit to be broken before any damage can be done through overheating. The "Magnet" shaving-pot is now fitted with an ebonite handle, which enables it to be picked up and carried about without any appreciable degree of heat to the hand. The bowl of the shaving-pot is of seamless copper heavily nickel plated. The new "Magnet" electric wash-boiler, claimed to be simple to operate, cleanly and reliable, is another interesting line. The standard type is of 10-gallon capacity, and has a consumption of 3/4 kW. It is constructed of heavily galvanised iron and is supplied complete with the 3-heat switch mounted in a metal box with a vitreous enamel cover, and five feet of waterproof C.T.S. flexible. In the de-luxe model the outer casing is finished in cellulose enamel.

A wide range of heating and cooking apparatus is being marketed by THE BASTIAN METER CO., LTD., of Farnham Road, Trading Estate, Slough. Included are the "Imperial" fires, "Imperator" heaters, canteen boilers, grilling ovens, and hot water systems. Bastian water heaters can be fitted with wall brackets if desired, and the type 800 is fitted with a thermostat, of which two kinds are offered—the mercury break adjustable and the single-temperature non-adjustable a.c. thermostat. One of the special features of the 1929 models is the lagging with 2 in. granulated cork surrounded by a casing of sheet steel, which is sprayed with enamel. The firm's well-known immersion-type elements can now be supplied fitted in copper tubes, which can be withdrawn from the tank for de-furring purposes. This construction, together with the loose lid, should make cleaning and maintenance quite simple. Bastian storage geysers are available in various sizes for bathroom and kitchen.

As winter and bad weather approach, the Sadia drying stand, which we have previously described, will doubtless become increasingly popular. It is marketed by SADIA, LTD., of 22, Newman Street, Oxford Street, London, W.1, who also sell many useful heating and cooking devices. Another useful line is the series of "Electro Special" aluminium pans and kettles which have been especially designed for working with totally enclosed fast-boiling plates. These pans are made by a special process, the aluminium being compact and free from pores. The bottom is 8 mm. (⅓ in.) thick and machined flat. The handles of both pan and lid are made of hard wood. The outside is highly polished, while the inside is finished matt. There are no sharp corners. By making perfect contact with the boiling plate, this type of pan effects a saving of time and current up to 20%. For instance, a 1 600 W Sadia boiling plate will, it is stated, boil 3 pints in an 8-in. kettle in 12 minutes, as against 16 minutes in an ordinary kettle.

The "Sadia" water heater, also by SADIA, LTD., is suitable either for placing at the point where hot water is required or for supplying several draw-off taps located in different parts of the house. The heater works on the displacement principle, and once it has been in use there remains a plentiful supply of hot water unless and until the heater is emptied. The thermostat incorporates a special locking and sealing device; it can be removed without the necessity of emptying the water from the container. The container, which appears to be very thoroughly lagged, is made of heavy sheet copper, welded and tinned, for soft water, or of welded galvanised iron for hard water. The copper containers are, it is stated, tested to 120 lb. sq. in. for a maximum working pressure of 60 lb./sq. in. while the galvanised iron containers are tested to 180 lb./sq. in. for a maximum working pressure of 90 lb./sq. in. All working parts of the heater are mounted on a base plate and can be removed for cleaning by undoing eight bolts, which leaves the container bare. The smallest Sadia heater has a capacity of 1½ gallons, and is loaded to 500 W. It is recommended for fixing over wash-hand basins or sinks, and for shaving water at hairdressers. The volume of the lagging is stated to equal three times the volume of the water container. The 2½ gallon size is intended for fitting over narrow basins; it projects only 8 in. from the wall, is well finished in white enamel with nickel-plated fittings, and will provide two gallons of water at 195 deg. F. immediately, or a steady supply of one gallon per hour throughout the day.

A Stand-type Boiler.

Another Sadia item is a stand-type boiler, which consists essentially of a water container of wrought iron completely galvanised and lagged, a protecting cover, heating element, regulator and the necessary switchgear. The lagging is shown to be effective by the statement of the firm that a 44-gallon boiler heated to 185 deg. F. only falls 39·5 deg. F. in 12 hours, provided no water is drawn off. The boiler is controlled by a temperature regulator, which acts as a relay to a contactor. The sensitivity of the regulator permits a constant temperature—within one or two degrees F.—to be maintained. When working on a.c. the contactor can be combined in one unit with a time switch, and for d.c. an ordinary time switch can be used. The boilers are normally constructed to heat up in eight hours with the listed consumption, but they can be constructed for any desired consumption over a heating-up period of not less than five hours.

Several changes in their fires and cookers are announced by THE ARORA CO., of Loughborough. The most important improvement in the construction of Arora fires is the introduction of the new type "C" firebar, termed the "Honeycomb" bar, and now included as a standard fitting to a number of models. An attractive honeycomb effect and a pleasant glow are produced by this new bar, which reflects its glow and radiates its heat from practically the whole area of the bar. The original Arora winding is employed. Another improvement is the introduction of the entirely British made switches which can be operated with very light pressure by the foot. A further constructional improvement is the new porcelain insulated 3-part terminal supplied with all Arora apparatus, allowing any product to be connected to earth where this is desirable.

A further improvement has been made in the design of Arora fires, in the extension of the use of white metal in the manufacture of certain models. This metal is highly reflective and will harmonise (by reflection) with any colour scheme of furnishing or decoration in any room. It has the advantage of wearing the same colour throughout however vigorously it is polished.

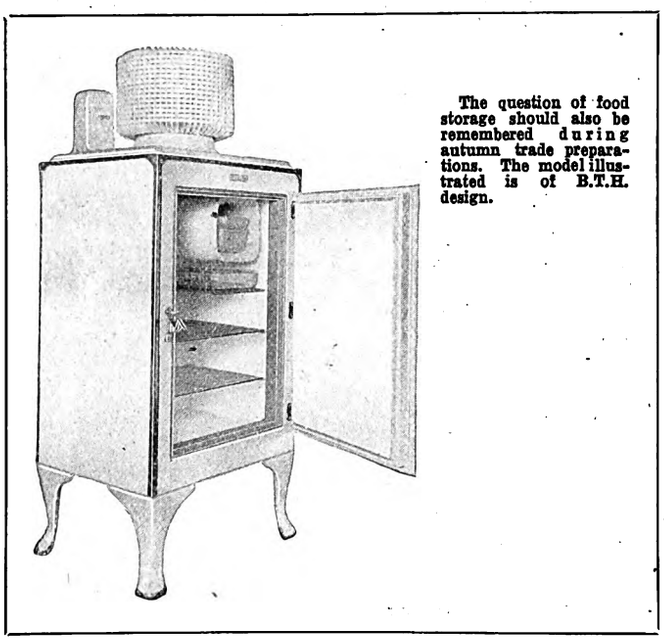
The Arora Co. is also specialising this season in a new system of tubular heating for large buildings and large rooms. The tubes can be run along the skirting where they are quite inconspicuous, and alternate or single sections can be operated on each switch. The standard loading is 66 W per ft., resulting in a heating capacity of 90 cu. ft. of room space to one foot of tube. The casing is of seamless steel tube about 1¼ in. in diameter.

Among the large number of fires offered for the winter season by THE JACKSON ELECTRIC STOVE CO., LTD., 143, Sloane Street, London, W.1, is a new series of "Chinese" fires, "fabric" finished in Chinese blue, red, bronze, or grey. These fires are fitted with chromium plated reflectors and are supplied in various sizes. The many virtues of the Jackson Junior cooker are again being emphasised this autumn.



The question of food storage should also be remembered during autumn trade preparations. The model illustrated is of B.T.H. design.

One of our illustrations gives a good idea of the distinctive appearance of the "Grecian" fire of ELECTRICAL UTILITIES, LTD., Tudor Works, Park Royal, London, N.W.10. This is a 3 kW fire, employing two "grid" elements, each with its own switch There are two finishes: copper plate and grey or brown vitreous enamel. Various other fires as well as cookers and toasters are suggested by this firm.

H. W. SULLIVAN, LTD., 72, Leo Street, Peckham, London, S.E.15, have three new electric fires, the "Cinderella," the "Charma," and the "Challenga." The Cinderella has the special feature that the top element may be raised, by turning a handle, for heating a kettle placed on the top of the fire.

In "Sullivan" electric fires, the heating elements take three distinct forms known as the "Clip" element, the "Uniglow" element, and the "Paraglow" element. In each case, the spiral consists of a metal strip wound in a special manner, stated to be different from that employed in any other electric fire. The construction of this spiral allows the air to circulate more freely through the winding, enabling the strip to be safely run at a higher degree of incandescence than is sometimes employed; also, the appearance when glowing is far more pleasing than the usual plain coil. The spirals are of thicker section than is usual, thereby securing a robust construction and long life. In addition, there are numerous Sullivan cookers, toasters, warming plates, etc.

It is claimed that the "New Electriglow" fire, manufactured by ELECTRIC FIRES, LTD., Heatrae Works, Norwich, gives a perfect effect of combined blazing fuel and smoke. In this fire there is the appearance of glowing coals both behind and in front of the heating elements. This model is sold in three sizes, giving, 1, 2, and 3 kW. The "Crater" fire, in addition to symbolising living coals and smoke, imitates the effect of a flame. It is finished in nickel-plate and polished aluminium. Heatrae electrically heated towel rails are another accessory which should appeal to autumn traders.

The "Furniculus" luminous stoves are suggested by THE A. E. G. ELECTRIC CO., LTD., of 131, Victoria Street, London, S.W.1, who, among many other domestic appliances, also market electric teapots, towel driers, coffee percolators, and ovens. The "Carnifix" 1 kW oven, designed for small flats and bungalows, is another interesting line.

One of the most popular fires produced by SIEMENS ELECTRIC LAMPS AND SUPPLIES, LTD., 38-39, Upper Thames Street, London, E.C.4, is the "Cosyglow," available in bronze or polished aluminium finish. A higher-priced model of the "Cosyglow" has an armour bright finish. The reflector fires by the same company should also be borne in mind. These are made in a number of types, with loadings up to 750 W. Screen fires are another Siemens line, and are obtainable with loadings up to 1 000 W. 2 kW well fires and "Excel" coal fires, together with the numerous small domestic appliances offered by the company, make a wide choice for the electrical contractor.

THE REVO ELECTRIC CO., LTD., (Britannia Works, Tividale, Tipton, Staffs, and 30, Great Queen Street, Kingsway, London, W.C.2), has endeavoured to make the design of the "Colonial" cooker comply exactly with every requirement. The oven is constructed in one piece, with rounded corners and welded joints, and vitreous enamel finish is used inside and out. The floor is brought forward to form a weathered joint with the front casting, thus preventing the ingress of liquids to the lagged chamber. Top and bottom heating elements, each controlled by a 3-heat switch, are fitted, and the elements are of the plug-in pattern. The plugs are arranged outside the oven to avoid overheating and the contacts are of non-corrosive metal. One 8 in. diameter (1 600 W) and one 6½ in. diameter (1 000 W) circular boiling plate are fitted to the hob. Each is of the totally-enclosed high-speed pattern which is standard in Revo cookers. The plates may be readily removed by lifting, so that the connections are at once accessible. Grilling is performed by making use of the top oven element, which for this purpose operates at red heat. The fuses can be easily reached by the removal of a vitreous enamelled inspection cover. The standard model has stoved black front, door, base and leg castings, all remaining metal parts being vitreous enamelled. The de-luxe model has all castings vitreous enamelled. Each is supplied complete with two oven racks, drip tray, grill pan and drainage tray, while a thermometer can be fitted as an extra if desired. The specification of the cooker is as follows:—

Size	Overall	Oven Cooking Space	Grill	Boiling Plates	
				1 Large	1 Small
Width	24½ inches	14 inches	8 inches		
Depth	18½ ,,	12½ ,,	10 ,,	8 in. diam.	6½ in. diam.
Height	37 ,,	12½ ,,			
Loading in Watts	4 400	1 000	800	1 600	1 000

Net Weight:—1 cwt. 3 qrs. 18 lb.

A new system of heating by electricity has been introduced by THE ARTIC FUSE AND ELECTRICAL MANUFACTURING CO., LTD., of Birtley, co. Durham. It is known as electro-velocity radiation, and comprises the use of radiators which draw in air at the bottom, heat it to a predetermined temperature, and project it at the top.

The circulation, which varies in speed from 180 to 220 ft per minute, is produced automatically by the nozzles of the radiator. There is claimed to be uncomfortable draught while the temperature is maintained at an agreeable level with the minimum of cost. The firm points out that as the electro-velocity radiator has as its means of heating a room both surface radiation and the current of warm air it has a marked advantage over steam and water heating systems—an advantage which is further increased by the fact that the temperature of the heating element is not less than twice the temperature of

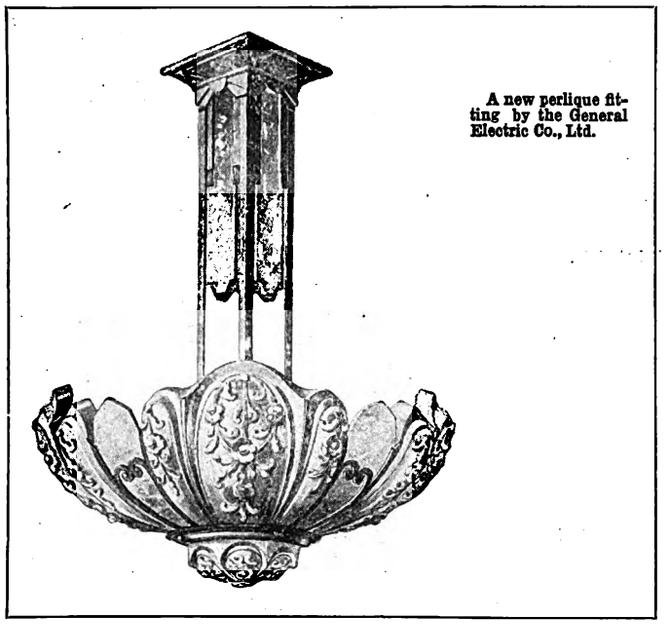
the steam radiator. The nickel-chromium element is capable of being run continuously at a red heat, but in practice it is kept at a black heat, thus providing a high safety factor and reducing the possibility of failure. The radiators are made for various wattages and for wall, bulkhead or floor mounting. They can be arranged for connections for 2 or 3 degrees of heating, depending on the size of the radiator. The standard finish is in aluminium.

The latest addition to the range of domestic appliances manufactured by FALK, STADELMANN AND CO., LTD., Veritas



A new perlique fitting by the General Electric Co., Ltd.

House, 83-93, Farringdon Road, London, E.C.1, is a low-priced electric iron designed in good quality nickel-plated finish, with thumb rest, connector, 2 yds. heavy-braided flexible cord and wire rest at back. The weight is approximately 5 lbs., the consumption 600 W. and it is stocked for 200/220 and 230/250 V.

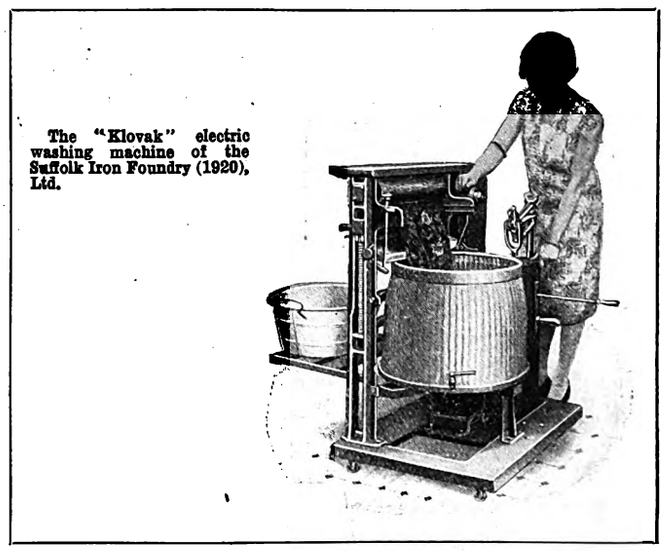
The correct lighting of windows is another aspect of trade promotion, and much of the success of shop window reflectors depends upon the correct focus of the lamp, and as lamps of different wattage have varying light centres, some means of adjustment to obtain correct focus is necessary. This problem has been met by a gallery recently patented by PHILIPS LAMPS, LTD., of Philips House, 145, Charing Cross Road, London, W.C.2. The gallery is very simply constructed. It is made in two parts, the shade-carrying part fitting inside the other, and being held in the desired position by means of three pins which engage in appropriate slots according to the wattage of the lamp in use. A coil spring in the inside of the outer portion maintains rigidity. It is thus a simple matter to ensure the correct focal position of the filament. In order to remove the reflector for cleaning purposes it is unnecessary to interfere with any screws, as the bottom half of the gallery holding the reflector is disengaged by a simple turning movement. Owing to the light centres of electric lamps having been standardised by the leading lamp manufacturers, the gallery is suitable for use with any ordinary make of lamp. Philips Lamps, Ltd., supply with each gallery particulars showing the appropriate slots for use with various types of reflectors and sizes of lamps.

The ELECTRIC HEATING CO., of Croydon, has just put on the market a very simple electric appliance for stripping paint. This consists of an electrically heated element enclosed in a casting of Admiralty brass having a bottom plate of steel. The loading is in the neighbourhood of 80 W. The bottom plate is brought to a sharp edge and should it by accident come in contact with a hidden nail, a new plate can be fixed at the cost of a few pence. From the element running up a steel tube into the handle, which, by the way, is set off from the cast element chamber to prevent the hot paint falling on to the hand when in use, are the connections which are protected by fish spine beads, the ends of the lead being connected to the terminals at the top of the handle.

The No. C. 196 cooker of CREDENDA CONDUITS CO., LTD., Oldbury, Birmingham, is one of a new series and is a very useful size for average family use. Many striking improvements and refinements have been incorporated. The standard finish is white vitreous enamelled oven door panel, hot cupboard door panel and switchplate. Granite grey vitreous enamelled hob and feet. Mottled grey vitreous enamelled removable oven interior. Vitreous enamelled oven linings. Other parts triple stoved black. A de-luxe model is also made, and this has white vitreous enamelled oven door panel, hot cupboard door panel and switch plate. White vitreous enamelled oven sides (exterior). Granite grey enamelled hob, feet, front frame, door frame and base. Mottled removable oven interior. Vitreous enamelled oven linings. Polished aluminium switchbox cover. The boiling plates are of the enclosed type, 8¾ in. diameter, of 2 kW loading and 7 in. diameter, 1.2 kW. The grill, 10 in. by 8 in., 1.5 kW loading. The oven is removable in one piece for ease of cleaning and the size is 15 in. high by 14 in. wide by 14½ in. deep, with a loading of 2.5 kW. Another cooker is No. C. 195 with a total maximum loading of 6.8 kW. A smaller unit is the No. C. 184 model fitted with two boiling plates (8¾ in. dia., 2 kW, and 6¼ in. dia., 1 kW) and a 10 in. by 8 in. grill with a 1·5 kW loading. The oven measures 12 in. by 13 in. by 12 in. and is loaded to 1.75 kW, making the maximum load of the cooker 5.25 kW. An extensive range of smaller appliances such as irons, kettles, boiling rings, hot plates, etc., is also offered.

The Credenda Co. also offers a wide selection of fires of the portable reflected heat type and also of the cast metal type. Of the latter there are three of the " Imp " series finished black stove enamel, with loadings of 1, 2 and 3 kW respectively. The " Trivet " series also consists of three fires with similar loadings finished in black and copper. Of the more elaborate models may be mentioned the " Ritz " finished in black and copper with a 2 kW loading, the " Carlton " (3 kW) with similar finish, and the " Majestic " (4 kW). The latter is fitted with three switches and heats 4 000 cub. ft. It is obtainable in black and copper finish as well as in bronze. Bathroom fires with 1 kW loading and screen fires are offered in addition to the " Sudan " (2¼ kW) and the " Sahara " (2¼ kW) portable fires.

A new electric washing machine—the " Klovak "—is being made by the SUFFOLK IRON FOUNDRY (1920), LTD., of Stowmarket. It possesses many unique features, and the manufacturers claim that a full week's washing can be accomplished



The "Klovak" electric washing machine of the Suffolk Iron Foundry (1920), Ltd.

in half-an-hour, the cost of electricity consumption being less than one penny. The special posser, which is made of copper, works up and down as the tub revolves. By this action dirt is not battered out of the garments, but gently " racked." The motor is direct coupled, the controls are very simple, and all movable parts are totally enclosed. The complete machine is guaranteed for twelve months.

LANE AND GIRVAN, LTD., Caledonia Stove and Electrical Works, Bonnybridge, near Glasgow, are making a special feature of their " Caledonia " series of electric fires. These comprise bowl and candle fires of various sizes and capacities, while a new bar type fire will find its way to the market in about two weeks' time. The bowl fires have been designed to meet all ranges of requirements as regards cost, from the cheap to the more expensive types with chromium reflectors, while the candle fires cater in a similar manner. The bar fires,

generally speaking, are low-priced and in a variety of finishes. The candle fire, which is rated from 1 to 3 or 4 kW, is a new departure in the " Caledonia " range, the better-class models of which have nickel-chromium reflectors. The finishes range from standard black stove enamel to cellulose and porcelain enamel in colours.

Radio Opportunities.

Another aspect of autumn trade is that dealing with radio, and with the rekindled interest brought about by the National Radio Exhibition, the forthcoming Manchester Exhibition and the starting up of the Brookman's Park station, electrical contractors would do well to keep their stocks of radio goods up to date. A number of new receivers and components have just been placed on the market in connection with the show at Olympia and among these may be mentioned the transportable all-electric three-valve screened grid receiver of RADIO INSTRUMENTS, LTD., 12, Hyde Street, London, W.C. This is a three-valve receiver using indirectly heated " Cosmos " valves in the a.c. model, while in the d.c. model, ordinary valves are used of the screened grid detector and pentode type. The receiver gives a wide choice of programmes without the use of an aerial or earth, though provision is made for connection to an external aerial, thus increasing the range of the instrument and the choice of programmes. The mains part of the set is fitted in a separate compartment below the cabinet. The latter is fully screened, the whole of the mechanism being contained in a screening box, so that when lifting the lid of the instrument, the aluminium top of the panel alone is seen. Another new set is a mains or battery operated 2-valve receiver in a bakelite case. The receiver is suitable for battery operation, and can be converted into an all-electric set for either a.c. or d.c. mains, by mounting it on a bakelite pedestal unit which contains the complete electric equipment. It has single dial tuning, the dial being set at an angle of 45 deg.

The " A.C.3 " receiver by the IGRANIC ELECTRIC CO., LTD., 149, Queen Victoria Street, London, E.C.4, is another new line comprising a three-valve all-mains receiver and employing a screened grid h.f. valve and a pentode valve. Many novel features appear in this receiver, which is made in table cabinet and in bureau type cabinet form, the latter incorporating an electric gramophone and a self-contained aerial. The " Igranic Neutrosonic Seven " receiver is another popular line made in transportable form with combined battery box, frame aerial and loud speaker. It is also made in table cabinets and bureau type cabinets, the latter incorporating the frame aerial. A model designed for entire operation off a.c. mains, and incorporating an additional l.f. amplifier and gramophone reproducer is also likely to prove very popular. The " Universal " receiver is also offered and this portable set is suitable for outdoor or permanent use in the home. Two screened grid valves are employed in the h.f. stages, and it is essentially a long range receiver.

"ELECTRICAL WIRING AND CONTRACTING."

Readers who are familiar with Sir Isaac Pitman and Sons, Ltd., and their past enterprises in connection with the publication of technical works, will be interested to learn that on October 9th the first part of a new serial issue will appear, namely, " Electrical Wiring and Contracting." This will comprise a series of eight practical volumes, divided up into 30 weekly parts, and obtainable from a newsagent at one shilling each. Mr. H. Marryat is the editor of the work, and he has been assisted by a large group of experts, a list of whom is contained in a prospectus issued by the publishers of the library.

THE E.D.A. window display for October [illegible] specially designed for promoting autumn trade and appropriately features " Warmth." This design, used in conjunction with the suggestions given on the preceding pages, should permit of electrical windows being made attractive enough to establish an unprecedented demand for electrical heating equipment of all types. A number of special posters for promoting autumn trade are also ready.

THE NATIONAL RADIO EXHIBITION.

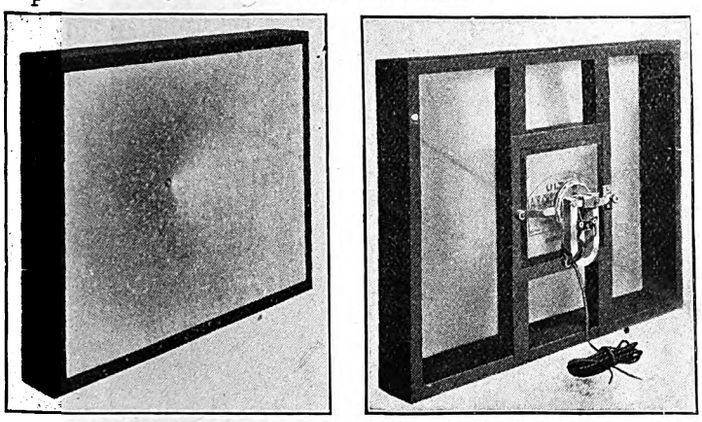
Increasing Popularity of the All-Electric Set—"Portable" Receivers Again Prominent—New Loud Speaker Designs.

A GENERAL impression of the National Radio Exhibition, which opened at Olympia, London, on Monday, is that manufacturers, anticipating the still wider use of electricity, have increased their number of "all-mains" designs. On the other hand, the exhibition includes a number of new high-tension batteries of the primary type, accumulators, and battery operated sets for those listeners not yet converted to mains working.

The exhibition as a whole does not include much that is new, which indicates, perhaps, that the industry is becoming more stable. Many standard sets have been redesigned insofar as cabinet work is concerned, their circuits arranged so as to include one or more screen-grid valves, and in some cases a pentode valve is fitted. One is impressed also with the number of "portable" sets now available, and though in most cases these are still too heavy to be regarded as really portable, their compact design warrants their popularity.

With respect to loud speakers, one of the most interesting is that shown by ULTRA ELECTRIC, LTD., of 661-663, Harrow Road, London, N.W.10. This incorporates the "air chrome" double diaphragm principle, and consists of two diaphragms, of chemically treated fabric, the respective area of each being closely related to the other, operated simultaneously by one driving pin. It is claimed that the large diaphragm gives a correct reproduction of the low notes, while the higher frequencies are dealt with by the small diaphragm. The unit used in the "air chrome" speaker is of the balanced armature type. The speaker is made in four sizes, ranging from 12 in. by 10 in. to 24 in. by 24 in. The latter size is one suitable for cinemas or other buildings where a volume larger than is usually required for domestic purposes is desirable, and we understand that special attention is being paid to the application of the "air chrome" to talking film reproduction.

The chassis of the instrument is illustrated below; the left-hand picture shows the front indicating the shallow curved cone formation of the larger diaphragm and the way it is stretched and secured to the rectangular wooden frame. The frame permits not only ease in handling and adaptability for mounting in any type of cabinet but also serves as a protection to the instrument. The right-hand picture shows the back of the speaker, the smaller diaphragm being stretched on the small frame.



Illustrating the construction of the Ultra "air chrome" loud speaker.

The GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, London, W.C.2, is showing among other sets a new and redesigned "Music Magnet" kit, girls demonstrating the easy construction in a very convincing manner. Apart from the already well-known products, a new 2-valve mains receiver designed to work on 200/260 V 50/100 cycle mains; a 3-valve screen-grid receiver in portable cabinet form (housing both h.t. and l.t. batteries); a 3-valve screen-grid receiver for mains operation; a 3-valve short-wave screen-grid receiver; a 4-valve screen-grid "portable"; a 4-valve screen-grid mains "portable"; and a 4-valve screen-grid table cabinet model are also shown. Among the new components of this company are a 2-valve mains amplifier and h.t. mains units for 20 and 40 mA respectively. The new l.f. "Hiflux" transformer is also attracting attention. Among the new loud speakers at the exhibition mention may also be made of the new G.E.C. "Stork" senior plaque model, a cone cabinet model, together with a new "Stork" loud-speaker unit.

Several new items are to be seen at the stand of GAMBRELL RADIO, LTD., of Buckingham House, Buckingham Street, London, W.C.2, but perhaps the most interesting is a special

A general view of The stand of the General Electric Co., Ltd.

device known as the "Novotone." The inventor of the unit, Dr. N. W. McLachlan, claims that the reproduction of gramophone records by loud speakers is unrealistic and the "Novotone" is intended for use as a compensator. The device is, we understand, also suitable for compensating any bad quality in the speech attending talking films.

The exhibits of RADIO INSTRUMENTS, LTD., 12, Hyde Street, London, W.C., are also interesting, including, in addition to the sets referred to on page 368, adjustable heavy duty chokes of 40/23 Henries at 200 mA and 0·085 to 0·025 Henries, 1 to 5 A. The inductance is changed by turning the adjusting screw, which varies the air gap in the centre of the core. Another new component is the "Dual Astatic" high frequency choke, specially designed for modern valves (including screened grid) and modern circuits using parallel choke feed. A further interesting exhibit illustrates the development in broadcast apparatus made by Radio Instruments, Ltd., since 1922, and shows the evolution of the low frequency transformer from the year 1915, and includes the first type of intervalve transformer designed by Latour. This historic exhibit also embraces high frequency transformers, a 5-valve set and a number of other accessories, popular in the early days of broadcasting.

Apart from the new receivers described on page 368, the IGRANIC ELECTRIC CO., LTD., of 147, Queen Victoria Street, London, E.C., includes in this year's exhibit a wide selection of new h.t. and l.t. supply units and battery chargers, together with such components as power transformers, smoothing chokes, potential dividers, etc., for the home construction of mains units. Another new product is the "dual wave" inductance, which, as its name implies, is a dual range coil, covering both the normal and higher broadcast wavebands. The coils are enclosed in a bakelite casing, and the unit has been designed to take the place of the six-pin coil, without the necessity of having to change coils, the change-over from one waveband to another being effected by means of a switch. In addition to plain and tapped triple honeycomb inductance coils and short-wave coils, a number of other interesting components are shown. Fixed coil holders for the "Igranic" coils have been redesigned, so that they are now capable of wider application. An improved short-wave choke and square law variable condensers, both for transmission and reception in various capacities, also the popular "Lokvane" condensers, together with a selection of micro condensers, screened reaction condensers, fixed condensers, and the "Pre-Set" condenser are other exhibits.

Amongst the l.f. coupling devices seen might be mentioned the new type "J" transformer, the "dual impedance" coupling unit and the "dual resistance" capacity coupling unit, the latter being particularly interesting in that it provides two alternative resistance values.

(*To be continued.*)

ELECTRICITY IN AGRICULTURE.

Special Problems of Arable and Stock Farming—Barn Work provides Best Electrical Opportunity—Electric Driving of Small Machines.

By J. G. B. SAMS, A.M.I.Mech.E., M.Inst.Loco.E.

THERE has been much consideration given lately to the place that electricity should take in agriculture and many ideas advanced, some of which will scarcely "hold water"; but as far as the writer is able to discover, too little attention has been devoted to discovering to what operations in agriculture the use of electrical power can be economically applied. High-sounding claims, which cannot be substantiated in practice, are apt to harm, rather than to help, both the agricultural and electrical industries.

The term "farming" for the purposes of this discussion may be considered as excluding the small holding of, say, fifty acres or less, and it may be divided broadly into arable and stock farming, each of which have their special mechanical problems.

The work to be done can again be divided into field and barn work, the former being seasonal and the latter fairly continuous, and it is in the field work that the electrical engineer will meet with the greatest difficulties.

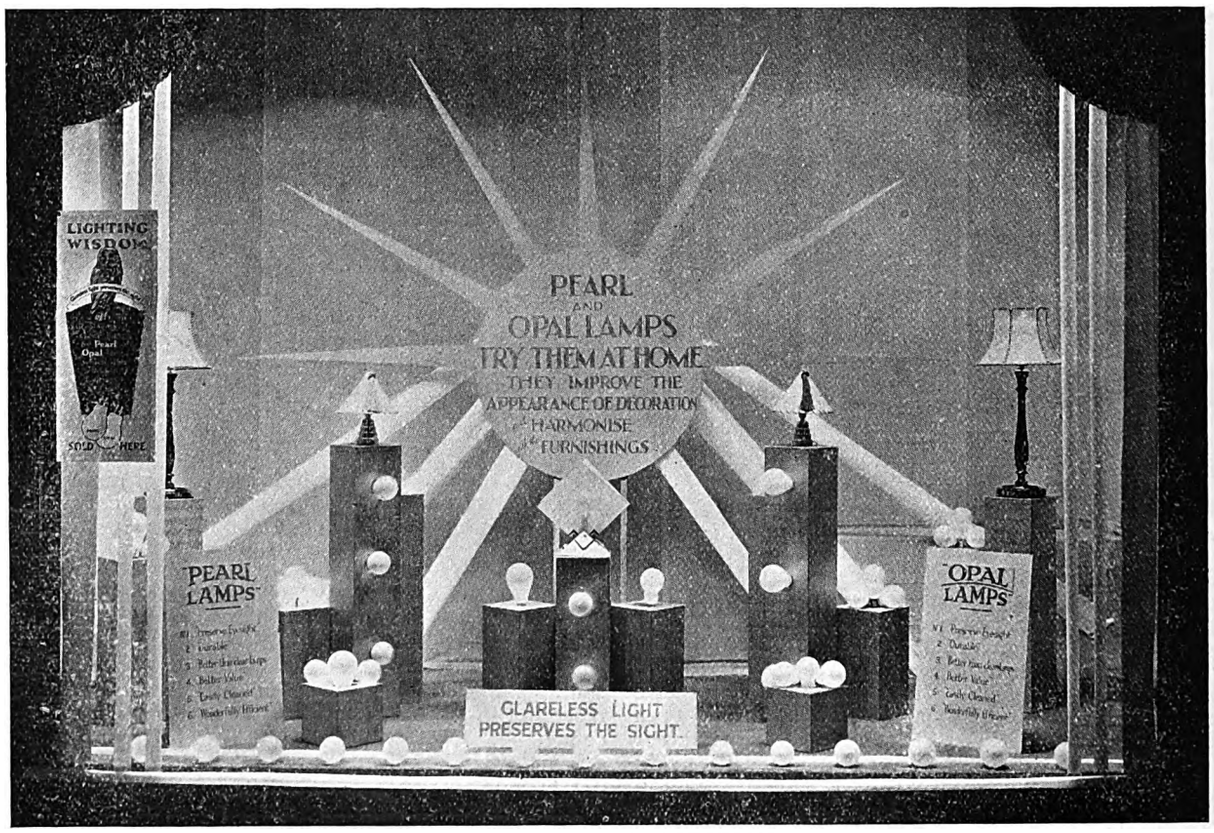
Field work can be outlined generally as ploughing and breaking up the land into a seed-bed, sowing the crop, cutting the weeds out from between the growing crop and cutting and carting the ripened result. Consider ploughing as an example of difficulty in electrical operation; at present the bulk of it is done by the farmers themselves with horse-teams at an acre a day, or with a paraffin tractor at three acres, supplemented on the heavier lands by heavy steam tackles using twin engines and cables (Diesels are beginning to appear in lieu of steam) capable of about 12 to 15 acres a day. Most farmers will only employ these heavy sets when they want some extra ploughing or cultivating strength in the summer or autumn, or, again, when some specially deep ploughing is required, such as sub-soiling. They are not invariably used, and are generally the property of contractors, who hire them out at so much per acre.

The farmers' argument against the complete use of these heavy sets is that in bad weather the wheels spoil the ground, and at times the engines are actually barred from going on the fields by the softness of the ground. Also that, observing that they have to retain horses and light tractors for other farming operations, these may as well be used for ploughing and cultivating, as they are not so severely incommoded by adverse weather conditions.

Reaping is frequently performed by mechanical power, in the shape of paraffin tractors, but the problem here differs from ploughing as the reaping machine travels continuously round the field until finished, instead of across, as with ploughing. In the absence of battery-run tractors, which may be ruled out in the present state of the science as too heavy, it will be seen from the foregoing explanation that the use of electrical power for field work argues the wiring of the country roads as well as the fields, and it may be said at once that this is a very doubtful problem from the point of view of economics.

Threshing offers an easier field, as it is possible to bring the stacks into such a close area that the motor of the threshing-drum can draw its power from a single fixed point of supply; but the arguments against are that the collection of the stacks into a closed area instead of having them scattered tends to increase the fire insurance rate as well as to increase cartage, though, if the fields were wired these points would not arise.

The writer, who is not without agricultural experience, is of the opinion that the horse can never completely be displaced in agriculture, on account of the number of light jobs for which it is economically suitable, but that a number of horses will be dispensed with on the larger farms in the early future in favour of light tractors designed to work in conjunction with a complete range of field implements and not with a bare one or two as at present, the tractors being equipped to travel when required upon the high road for cartage purposes to obviate the employment of motor lorries; and it does not seem possible to him in the present state of the science to operate these tractors electrically. These tractors will be additional to the heavy steam or Diesel tackles already dis-



A WINDOW SUGGESTION.

AN attractive display of pearl and opal lamps which has been designed by E.L.M.A. in connection with the Glareless Light Campaign. It is suggested that two similar table standards as shown above be installed, one with a glareless lamp and the other with a clear lamp, and arranged so that a thermal flasher automatically switches on first one and then the other. If the standards are placed against a whitish screen, the shadowless qualities of the glareless lamp are shown to advantage.

Digitized by Google

cussed, which will always be required for their special purposes, and which again do not appear likely to be supplanted electrically.

It is in barn work that the best electrical opportunity exists, and it is suggested that manufacturers should make a special study of these requirements, with a view of creating a demand. Here, again, it must be recalled that the small internal-combustion engine of anything up to 10 or 12 H.P. has a firm hold on the market, and nothing but very cogent reasons will ever displace it, as farmers are usually averse to change. But there is still a large amount of hand labour in this direction which is capable of mechanical displacement, and here the electrical manufacturer is on the easiest ground, always providing that there is a reasonable supply of current.

On every farm there is always a group of small machines for the preparation of the food for the horses and other live stock, together with cream separators, churns, and in some cases milking machines where cows are kept on a fairly large scale. Most of these machines are manufactured as portable, but the tendency is to place them in the convenient barn or shed, and to leave them there permanently. Consequently they may be considered as fixed, and as they can usually be arranged to give a fairly constant load factor during working hours, it would seem that electrical operation is very suitable.

Barring exceptional cases, these machines—chaff and turnip cutters, cake-breaking machines, churns and cream separators—are always built in one man-power sizes, as up to quite recently men were the most suitable power available, besides which the capacity of the size was quite a useful one for by far the larger proportion of farms.

Turning to the question of power for driving, this is varied by the fact that fodder-preparing machinery will, when power-operated, be driven much harder and more continuously than when man-handled; separators and churns, however, must always be operated at a constant speed, and will have the same load factor in each case. Taking the man-power sized machine, the former group may be assessed at 2 H.P. and the latter at 1 H.P. in each case; the total power required for one set of appliances will be modified by the fact that all the machines are not necessarily required simultaneously; thus, generally speaking, the separator alternates with the churn, and the turnip cutter with the cake breaker, chaff cutting machines being in fairly constant use all the year round.

Milking machines may be assessed at about 1 H.P. for the first ten, and 0·75 H.P. for each succeeding ten cows milked. It will usually be inconvenient to attempt to drive all the above machinery with one central motor, as the buildings are not necessarily conveniently placed for central driving, and rebuilding is out of the question.

Water Pumping.

Water-pumping and grist-milling must be considered separately, as they are not common problems on every farm. In the former case it might be helpful to farmers to put on the market a complete set of overhead tank, automatically controlled motor and pump, distinguishing the sizes by the number of gallons the tank will hold. The price in each case could be pretty well approximated, as the only variant would be the depth of the well—farmers will always want to know right away what it will cost to instal.

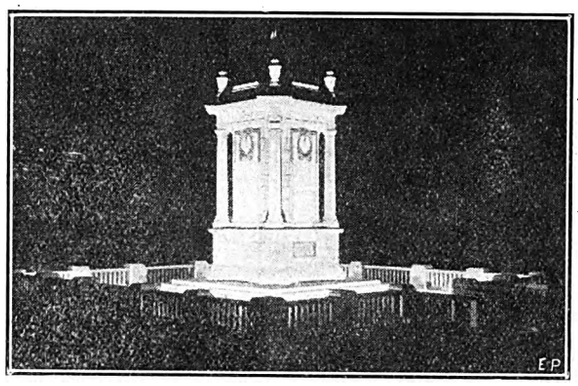
Grist-milling, that is the rough grinding of grain for fodder, is very frequently in the hands of local millers, but there is a tendency among farmers to acquire their own plant, which may consist of a pair of old-fashioned grindstones of about 4 ft. dia., or the modern equivalent in the shape of chilled steel rolls; both of these are always fixtures, and would absorb about 6 H.P. in driving. Here again a combination would be a useful marketing feature.

An account of the foddering, etc., machinery on the 1 000-acre arable farm on which the writer happens to be at the moment may be of some interest in this connection (of course, the plant would be much larger on a similar grass-land farm.) The pump is driven by a fixed 2½ H.P. non-automatic paraffin engine and runs for about three hours a day. In another shed is a similar engine driving a chaff cutter, and in a nearby shed is a 6 H.P. engine driving a turnip cutter, cake breaker, and small circular saw for firewood, etc., and as during the winter a large number of bullocks are kept for fattening, a small portable paraffin engine in conjunction with a turnip cutter is moved about to their location. Given electrical power, it would be better to distribute the prepared fodder from a central station. The churn and separator are hand-driven, and there is a petrol-electric set for lighting the house.

S. AFRICAN ELECTRICITY.

Electricity Supply Commission's Annual Report on Recent Progress.

THE sixth annual report of the Electricity Supply Commission of South Africa contains a record of the operations of the Commission during 1928, and a brief review of its work up to June 30th, 1929. The aggregate capacity of the Commission's five undertakings (Natal Central, Witbank, Capetown, Durban and Sadie) is 207 350 kW; and a 20 000 kW turbo-alternator is on order for the Witbank station. All these undertakings have reached the producing stage. The boiler plant at the several stations has a capacity of 1 800 000 lb. of steam per hour (normal rating), there are 453 route miles of overhead lines and cables carrying energy at pressures ranging from 380/220 to 88 000 V, step-up and step-down transformers installed amount to 281 720 kVA, and the motor-generators and rotary convertors in sub-stations have an aggregate rating of 68 000 kW. Plant and equipment in course of installation or on order includes generators, 52 000 kW; boilers, 520 000 lb. per hour; transmission lines and cables, 156 route miles; and transformers, 66 060 kVA. Coal consumption per kWh generated was 1·54 lb. at the Colenso station, 1·73 lb. at Witbank, 1·75 lb. at Salt River, and 1·7 lb. at Congella. At the date of the report the coal consumption at Congella had been reduced to 1·32 lb. per kWh, mainly due to the adoption of pulverised coal firing. At December 31st, 1928, the consumers from the Commission's five undertakings numbered 731, an increase of 345 during the year. Electricity sold during 1928 was 627 912 295 kWh, compared with 551 018 733 and 161 758 522 in 1927 and 1926 respectively. Up to December last the Commission's capital expenditure was £7 423 496, and the surplus (excess of assets over liabilities) at December, 1928, was £290 382. Revenue was £375 581, and after provision for generation and distribution costs and general expenses the balance was £260 378; of which interest required £163 478, and provision for repayment of loans £63 892, while £33 008 was placed to reserve. Up to the end of 1928, 145 municipal schemes had been reported on by the Commissioners, and supplementary reports upon tenders had been submitted in respect of 64 schemes. Schemes established number 148, and 14 are under construction.



THE floodlighting of the War Memorial at Bournemouth. The installation, designed by Siemens Electric Lamps and Supplies, Ltd., and carried out by the Corporation Lighting Department, comprises four 500 W units. The lighting of the memorial was carried out to demonstrate to members of the Public Lighting Engineers Conference, the possibilities of floodlighting.

Hammersmith (London) Electricity Committee recommends that, subject to a satisfactory agreement being reached, a quotation from the London and Home Counties Joint Electricity Authority for the supply of electricity in bulk to meet the whole requirements of the Council's electricity undertaking be accepted. The Joint Authority states that its proposal guarantees to the Council the progressive savings allowed for in the estimates which the Electricity Committee has submitted of the plant, etc., which the Council would find it necessary to install during the next seven years to provide for its own requirements and also provides for a further saving to the Council of approximately £38 000.

NEWS IN BRIEF.

Germany's Telephone Exports—The Birmingham Electric Club—Milan Cathedral and Public Telephones—Lincoln Electricity Supply and the Drought.

THERE are 152 541 telephones in use in New Zealand, an average of 10·3 per 100 of the population. This average is exceeded only by the United States and Canada.

Two engines of 65 and 36 B.H.P. and electricity generating plant have been installed at the Bath Cinema. The plant will supply the whole of the electricity requirements of the cinema and the adjoining Palais de Danse.

Seaham Harbour U.D.C. Works Committee has decided that, with respect to the proposed purchase of two concrete mixers, arrangements be made for electric, instead of petrol motors, to be supplied at an additional cost of £7 10s. each.

Eastbourne (Sussex) Parish Church is to be equipped for electric lighting at an estimated cost of £275.

At the trade exhibition in connection with the Bolton civic week, which commenced on September 20th, Bolton Corporation had an attractive electrical stand.

Germany's total export of telephone apparatus and material in the first half of the present year was 922·7 metric tons, against 761·6 and 555·6 in corresponding periods of 1928 and 1927, respectively. The quantity sent to Great Britain was 42·5, against 37·8 and 14·6 tons.

In connection with the recent housing week at Cape Town, the Housing League arranged with local electrical firms to exhibit electrical cooking apparatus at the City Hall. As this work was in the nature of propaganda in the interest of the Corporation electricity department, the energy and labour required in connection with the exhibition was supplied free by the department.

The Isle of Thanet Joint Hospital Board has decided to instal electric light plant at Haine Hospital, Ramsgate, at an estimated cost of £3 244.

It is stated that if the river Witham falls another 2 ft., Lincoln electricity works may be unable to continue the supply of current to local engineering works.

The Gloucestershire Highways Committee has been informed by the Ministry of Transport and the Home Office that no grant can be made towards the cost of automatic road-traffic signal apparatus.

Dundee and Forfar Sheriff Court Houses Committee has decided in favour of the installation of electric lighting equipment and a new heating system in the Sheriff Court House buildings, but that no action be taken until it is ascertained whether the County Council intends to adopt electric lighting throughout the County Buildings.

To avoid collisions between vehicles when the leading ones are stopped by the automatic road-traffic control signals at Salford, the expedient has been adopted at the Great Cheetham Street West and Bury New Road cross-roads of erecting in each of the four cross-roads and about 100 yards from the traffic signals, a prominent sign reading "Traffic Signal Ahead."

Since the Italian State telephone undertaking was transferred about four years ago to five companies, the numbers of telephones in their respective districts have increased by from 43 to 108%. The automatic system has been installed in nearly all the large towns in Italy, and its installation in smaller centres is proceeding. A telephone has been installed in the dome of Milan Cathedral to enable visitors to order carriages to await them at the cathedral door.

Two churches in the Cotswolds, at Coln St. Aldwyn and Chipping Campden, are to have electric light. In the case of Coln St. Aldwyn, the cost, £70, will be defrayed privately, and at Chipping Campden, the amount to cover the outlay of £75 will be obtained by subscription.

The Swedish State Telephone and Telegraph Department has opened up telephone communication with Italy, by means of a new line about 1 865 miles in length. The entire telephone system in Sweden is now owned by the Government, and has 490 000 telephones, or eight to every hundred of the population.

There were several electrical stands at the third annual exhibition held last week under the auspices of the Rochdale Chamber of Trade. Henry Tattersall, Ltd., showed Exide batteries. Rochdale Corporation occupied five stands and showed the latest electrical appliances, and Messrs. Fryer and Hancock, electrical contractors to the organisers of the exhibition, and other firms also exhibited.

Dr. C. C. Garrard will lecture on "Development in Electric Power Control" at the opening meeting of the second half of the session of the Birmingham Electric Club to-day (September 27th), at 7 p.m. Programmes of this and the succeeding half-session can be obtained from the hon. secretary, Mr. J. Entwistle, 9–10, Phœnix Chambers, Colmore Row, Birmingham. Ladies' night will be on October 18th.

The prospectus of the University College (London) Faculty of Engineering for the 1929–1930 session contains a list of the teaching staff, particulars of terms and vacations, conditions of admission, fees, degrees, examinations, scholarships, medals and prizes, degree, college diploma and special courses, a time table of classes and an outline of their work, information regarding the societies connected with the University, etc.

On the new 20 000 ton Orient liner "Orontes," which made a cruise in the Channel during last week-end, the propelling machinery consists of two sets of Parsons turbines which develop 20 000 S.H.P. at a speed of 1 388 r.p.m. Electricity for lighting and radiators and for working deck and other machinery and engine room auxiliaries is generated by three 400 kW dynamos, driven by steam turbines.

The opening general meeting of the 46th session of the North-East Coast Institution of Engineers and Shipbuilders will be held on the evening of October 18th, when Mr. Launcelot E. Smith will be installed as president. The Tees-side branch opening meeting will be held on October 24th. Forms of application for membership can be obtained from the secretary, Mr. E. W. Fraser Smith, Bolbec Hall, Newcastle-on-Tyne. Members of the Institution paid an official visit to the Shipping, Engineering and Machinery Exhibition, Olympia, London, on September 19th.

The 1929–30 session of the Borough Polytechnic Institute, Borough Road, London, S.E.1, commenced on September 23rd. In the electrical engineering department, of which Mr. W. C. S. Phillips is the head, there are day and evening courses, and the subjects dealt with include machine construction, electricity, generation, transmission and distribution, electrical installation work, cable jointing, telephony, telegraphy, wireless telegraphy and telephony, automatic telephony, etc. Further particulars as to fees, syllabuses, etc., can be obtained on application.

LOOKING BACKWARD,

FIFTY years ago, according to THE ELECTRICIAN *dated September 27th, 1879:—*

St. Enoch's Station, Glasgow, was lighted electrically as an experiment.

A Halifax church service was "broadcast" by telephone to Saltaire.

* * *

TWENTY-FIVE years ago THE ELECTRICIAN *dated September 30th, 1904, stated that:—*

Mr. Campbell Swinton was developing a 40 000 V transmission scheme in Scotland.

Electric cranes and electrically driven mortar mixers were used in building the new Home Office.

Major-General C. E. Webber, who played a prominent part in originating the Institution of Electrical Engineers, died, aged 66 years.

* * *

FIFTEEN years ago it was stated in THE ELECTRICIAN *dated September 25th, 1914, that:—*

A standard charging plug for electric vehicles was being advocated.

A Doncaster civilian was court-martialled for being in possession of wireless telegraphic apparatus.

* * *

TEN years ago THE ELECTRICIAN *of October 24th, 1919, reported that:—*

Experiments in transatlantic wireless telephony were described by Prof. J. A. Fleming.

The E.C.A. "Peace Dinner" was the Association's first social function since 1914.

PERSONAL.

ISLINGTON (London) Electricity Committee has appointed Mr. F. W. J. Corbett as relief charge engineer.

Fulham (London) Electricity Committee has appointed Mr. E. W. C. Day, of Finchley, as mains assistant.,

Mr. C. J. Fox, managing director of the Stanton Ironworks Co. has joined the board of Crompton Parkinson, Ltd.

Mr. James Fraser, chief Commissioner of Railways and Tramways in New South Wales since 1917, has resigned.

The Hon. Sir Charles and Lady Parsons arrived at 1, Upper Brook Street, London, on September 19th, on their return from South Africa.

Mr. C. E. Barton, of the Bradford Tramways Department, has been appointed rolling stock engineer to the Salford Tramways and Motorbus Committee.

Mr. C. A. Quarrington has been appointed head of the technical publicity department of Messrs. A. C. Cossor, Ltd., Cossor House, Highbury Grove, London, N.5.

The Igranic Electric Co. presented a canteen of cutlery to Mr. Arthur H. Browett and Miss Norah Towerton on the occasion of their recent marriage at Goring-on-Thames.

Mr. J. B. Parker, general manager of the Tees-side Railless Traction Board, has been appointed general manager of the Aldershot Traction Co. at a commencing salary of £1 200 a year.

It is announced that Captain P. P. Eckersley, formerly chief engineer of the British Broadcasting Corporation, has accepted an appointment as radio consultant-in-chief to the Amalgamated Press publications.

Mr. J. W. Spark, city electrical engineer, Bath, who met with a severe motoring accident during the summer, has made sufficient progress towards recovery to be able to relinquish his crutches. Mrs. Spark, who was also injured, is still using crutches, and it is expected that her convalescence will take longer.

Mr. S. B. Donkin has accepted office as President of the Association of Supervising Electrical Engineers for a further year. Mr. Donkin is a member of the firm of Kennedy and Donkin, a member of the Council of the Institution of Civil Engineers, and a member of the Institutions of Mechanical and Electrical Engineers, and the Association of Consulting Engineers, of which he was chairman during 1927–28.

On the eve of his impending departure from West Ham to take up his new post as chief engineer of the London and Home Counties Joint Electricity Authority, Mr. F. W. Purse was the recipient of two presentations last week-end. The first gift was that of a handsome silver cigarette box presented by members of the West Ham Rotary Club, of which Mr. Purse is a founder member and past president. The second presentation was by the West Ham Electric Power Users' Association, and consisted of an illuminated address and a fitted wardrobe bearing a suitably inscribed silver plate.

Referring to Mr. Victor Watlington's election as chairman of the B.E.A.M.A., the "English Electric Journal" recalls that he has been a working member of almost every important section from the earliest days of the Association, and has made a close study of the entire organisation, and that under his leadership the Association has entered upon a period of renewed activity and progress. After he completed his technical training at the Central Technical College of the City and Guilds of London under Professors Unwin, Ayrton, and Armstrong, Mr. Watlington concentrated his attention on tramway construction work, and following a period of service with R. W. Blackwell and Co., founded in 1906 a company that specialised in the supply of materials for electric traction. In 1911 he was appointed sales manager of Dick, Kerr and Co., Ltd., and subsequently took an active part in the organisation of the English Electric Co., of which he was sales manager until his appointment as managing director a few years ago. He is also a director of the Power and Traction Finance Co., and the Power and Traction Finance Co. (Poland).

Obituary.

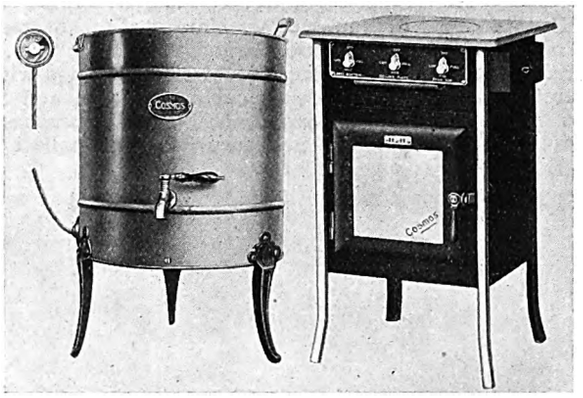
MR. C. COWLISHAW. He had for about 23 years been chief electrician at the works of Singer and Co., Ltd.

ALD. JOHN PYBUS, on September 20th, aged 84 years. Ald. Pybus was a member of Hull City Council 41 years, and was, for some time, chairman of the Electricity Committee. He was the father of Mr. P. J. Pybus, a director of the English Electric Co., Ltd., who was elected to Parliament as a representative of the Harwich division of Essex at the last general election.

BUSINESS ITEMS.

MESSRS. W. H. AXWORTHY AND CO., 4, Duke Street, Plymouth, have removed to 106, Tavistock Road.

With reference to the notice on page 341 of our last issue to the effect that the telephone number of the RELIANCE



ILLUSTRATING the type of wash boiler and cooker supplied by Metro-Vick Supplies for the Parkhall Housing Scheme. See paragraph on this page.

TELEPHONE CO., LTD., has been changed to Temple Bar 1010—this should have read Temple Bar 1011.

The firm of W. W. COOK AND PARTNERS, consulting engineers, will cease to carry on business after September 30th, as Mr. Cook is retiring and Mr. Pook is joining the International Telephone and Telegraph Corporation, in London.

In order that the name of the WALSALL HARDWARE MANUFACTURING CO., LTD., may more accurately accord with the products known as "Walsall" specialities, the name of the company has been changed to WALSALL CONDUITS, LTD.

The new automatic telephone exchange at Mitcham has been completed by SIEMENS BROTHERS AND CO., LTD., and was brought into service on September 11th. This exchange, which is included in the London automatic network, opened with 700 subscribers and has equipment for extending to 1 600 with an ultimate capacity for 3 000.

It is interesting to note the growing popularity, particularly in certain districts, of the all-electric house, a notable example of which is the Parkhall Housing Scheme, Clydebank, for which the CLYDE VALLEY ACCESSORIES, LTD., have recently placed with METRO-VICK SUPPLIES an order for 346 electric cookers and the same number of 10-gallon wash boilers.

With reference to the notice which appeared in our issue of August 16th (page 204) relating to an invitation of tenders for the erection of an electric bakery in Smyrna, the Acting British Consul-General reports that the Municipality of Smyrna has now decided to defer awarding of the contract, and that certain alterations may be made in the specifications.

IMPERIAL AND INTERNATIONAL COMMUNICATIONS, LTD., announce that on and after September 30th they will operate the cable and radio systems of the Eastern Associated Telegraph Companies and of Marconi's Wireless Telegraph Co., Ltd., together with the direct Empiradio and Imperial Cable Services, which are at present under the control of the General Post Office.

In connection with the description of the B.B.C. station at Brookmans Park, which appeared in our last issue, we are asked to point out that no less than 8 "D.P." batteries have been supplied. The largest consisting of 115 cells in lead-lined wood boxes, the battery having a capacity of 2 000 Ah. In addition to this and the filament lighting batteries there are three sets of 300-V 10 Ah batteries, all the batteries being supplied and installed by the "D.P." BATTERY CO., LTD., of Bakewell and London.

During this week the "Philips Wonder Van," escorted by a fleet of radio receivers on wheels, toured the Metropolis. The van is as large as the latest London omnibus, and contains the most up-to-date Philips radio apparatus. The equipment includes a studio for broadcast and public address work, and apparatus powerful enough to enable the loud speaker to be heard over a range of several miles. All current supplies are generated on board. By night the van presents a brilliant spectacle with a show window which contains an artistic display of the company's products, brilliantly illuminated.

THE SHIPPING, ENGINEERING AND MACHINERY EXHIBITION.

A Further Review of Some of the Exhibits of Outstanding Electrical Interest—Equipment for Marine and Industrial Application.

(*Concluded from page* 307).

THE MARCONI INTERNATIONAL MARINE COMMUNICATION CO., LTD., Marconi House, Strand, London, W.C.2, exhibited a comprehensive range of wireless and non-wireless apparatus. Replicas of wireless cabins on large and small ships were erected on the stand, and other apparatus was so arranged that the space necessary for the installation on

Two vertical furnaces, type 16R, with an output of nearly 2½ tons of steel parts, and type 12 with a similar output of 1¼ tons. Both furnaces were shown by Wild-Barfield Electric Furnaces, Ltd.

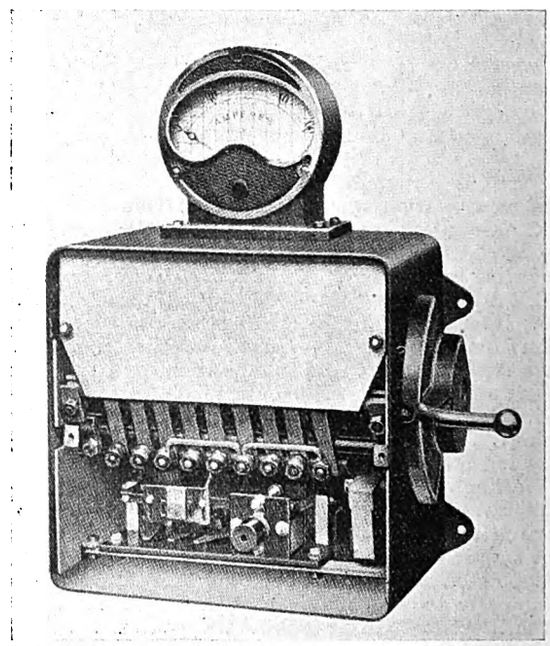
board ship could readily be estimated. In the larger cabin a 2 kW valve transmitter type M.C.6 for c.w. and i.c.w. telegraphy, and a short-wave transmitter type 295, were shown, together with a quenched spark emergency transmitter, and long and short wave receivers. The latest model Marconi direction finder, type 11G, in which screened grid high frequency amplifier valves are used, was also installed as on board ship. The smaller cabin illustrated the ¼ kW quenched spark transmitter, two-valve receiver, and direction indicator, installed in accommodation such as is usually found in small ships. The direction indicator is a modified form of direction finding receiver, comprising a small untuned single rotating frame used in conjunction with an amplifier of the type supplied with the type 11G direction finder. The instrument is designed to work over two bands of wavelengths—180 to 300 and 450 to 1 100 metres. A number of other transmitters were exhibited, including new types of i.c.w. transmitters of ½ kW and 1½ kW rating, a self-contained wireless telephone set intended for use on board yachts, whalers, trawlers, and other small vessels. A section of the stand was devoted to the Marconi marine electrical equipment. Here were exhibited depth sounding devices based on the Langevin-Florisson supersonic system, to which certain modifications have been applied—in particular, a new indicator which shows directly and visibly the depth of water, the pointer remaining stationary for a definite period at the depth last obtained.

THE RADIO COMMUNICATION CO., LTD., 34, Norfolk Street, London, W.C.2, also exhibited marine radio apparatus for all classes of ships. A ship's cabin containing a complete 1½ kW transmitter and receiver conveyed an accurate impression of the appearance and space required for efficient operation. The valve transmitter was of c.w. and i.c.w. type, with an independent emergency transmitter embodied in the main transmitter. The two-valve receiver shown covers a wave range of from 220 to 22 000 metres and is capable of receiving from all types of transmitters. An i.c.w. valve transmitter with a power of ½ kW designed for cargo and small passenger ships, and a wireless installation for lifeboats was also included in the transmitting installations exhibited. The Radio Communication Co. exhibited its new radio direction finder for large and small ships. This instrument has been specially designed for installation in chart rooms, and was installed in a representative chart room on the stand. It has a small frame having no exposed wires and giving a minimum of visual obstruction, an instantaneous sense indicator, automatic quadrantal corrector, and a selective amplifier with a wide wave range. An extra frame with its supporting pedestal was mounted on the floor of the stand to afford visitors an opportunity of detailed examination. The auto alarm for use on ships which do not keep a continuous wireless watch was demonstrated.

AEROSTYLE, LTD., 174/6, St. John Street, London, E.C.1, exhibited a full range of spray painting equipment, including spray pistols, pressure control and purifying equipment, air compressors, fume exhaust plant; also portable air compressor sets and spraying plants, both electrically-driven and petrol engine-driven. Demonstrations on all classes of work were undertaken continuously throughout the run of the exhibition.

ALLEN LIVERSIDGE, LTD., 123, Victoria Street, London, S.W.1, showed a full range of welding equipment. Included in the exhibit were A-L dissolved acetylene (high pressure) and A-L "Imperial" (low pressure) plants for welding and metal-cutting, A-L electric arc welders and A-L "Pontelec" resistance welders, together with blowpipes, welding wires, fluxes and all accessories.

BATTERIES, LTD., Redditch, displayed their "Nife" nickel steel alkaline batteries. These, being constructed mainly of steel, will, it is claimed, withstand vibration, will not sulphate or suffer from any kindred disease and can, therefore, remain idle indefinitely. The absence of acid fumes enables the "Nife" accumulator to be placed next to delicate instruments or



An internal view of the steel case air-break cam type star-delta starter exhibited by the Electro-Mechanical Brake Co., Ltd.

machinery without damage to the latter. It is claimed that it is impossible to buckle the plates by a short circuit or even accidentally charging in the wrong direction.

CELESTION, LTD., London Road, Kingston-on-Thames, showed two major exhibits. The first group was of a range of electric gramophone reproducers and automatic band repeaters for marine use, and the second was the "Loudaphone," a new type of loud-speaking telephone.

S. G. BROWN, LTD., Western Avenue, Acton, London, W. 3, exhibited for the first time a new gyroscopic artificial horizon. A complete Brown gyro compass equipment was also shown in operation, together with an automatic helmsman, 350 deg. course recorder, bearing, steering and radio repeaters.

Digitized by Google

THE CABLE MAKERS ASSOCIATION, Sardinia House, Kingsway, London, W.C.2. This exhibit was intended to be generally representative of the various types of cables used in electric light and power installation. These include india-rubber insulated cables, with various metallic and non-metallic protective covering in single conductor, concentric and multi-core cables. Special cables for ship work, for flexible protected cables for deck lights, motors, cranes, etc., were included. Types of telephone cables for ship and land installations were also exhibited. Heavier cables for land installation were shown, with various types of insulations such as paper and bitumen, armoured and unarmoured. These types of cables are made by the members of the Cable Makers Association, whose names are set out below:—The Anchor Cable Co., Ltd.; British Insulated Cables, Ltd.; Callender's Cable and Construction Co., Ltd.; the Craigpark Electric Cable Co., Ltd.; the Enfield Cable Works, Ltd.; the Greengate and Irwell Rubber Co., Ltd.; W. T. Glover and Co., Ltd.; W. T. Henley's Telegraph Works Co., Ltd.; the India-Rubber Gutta-Percha and Telegraph Works Co., Ltd.; Johnson and Phillips, Ltd.; Liverpool Electric Cable Co., Ltd.; the London Electric Wire Co. and Smith's, Ltd.; the Macintosh Cable Co., Ltd.; Pirelli-General Cable Works, Ltd.; Siemens Bros. and Co., Ltd.; St. Helens Cable and Rubber Co., Ltd.; Union Cable Co., Ltd.; Standard Telephones and Cables, Ltd.

CAMBRIDGE INSTRUMENT CO., LTD., 45, Grosvenor Place, London, S.W.1. Here was seen a representative collection of instruments for ships and engineering works, including electrical apparatus for indicating and recording CO_2 and CO percentages in flue gases, etc., apparatus for recording the percentage of dissolved oxygen in boiler feed water, draught and pressure gauges, temperature measuring instruments, etc.

THE CHLORIDE ELECTRICAL STORAGE CO., LTD., Clifton Junction, near Manchester. Storage batteries covering a wide range of marine purposes, from small hand lamp cells to the cells used for under water propulsion of submarines were included in this exhibit. An Exide-Ironclad battery, for yacht and marine work, was displayed in a "cut-away" which showed the sectional construction. Another exhibit was an Exide-Ironclad cell of the very largest size, as used for the propulsion of submarines.

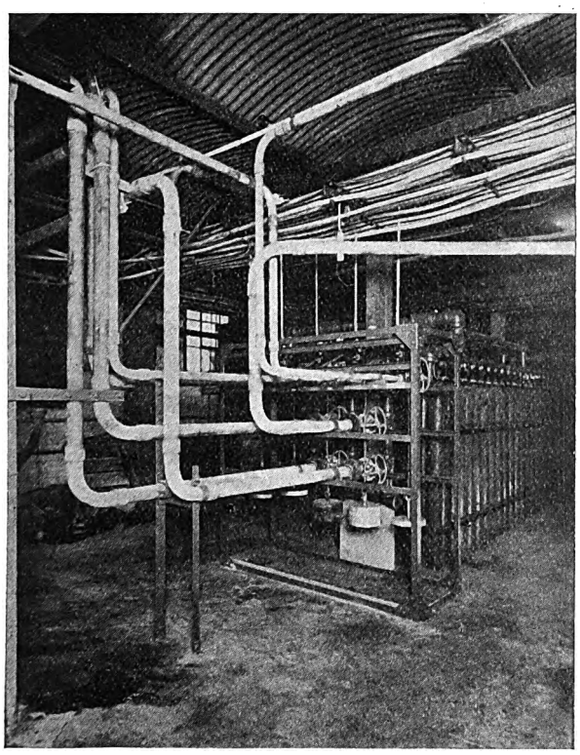
CROSSLEY BROS., LTD., Openshaw, Manchester, exhibited in working operation heavy oil engines of entirely new construction as follows: Vertical marine auxiliary set, comprising Crossley 5-cylinder compressorless Diesel engine, 137 brake H.P. direct coupled to a Metro-Vickers 90 kW 220 V, marine type d.c. dynamo at 450 r.p.m. complete on underbaseplate. The set is specially designed for ship lighting or for electric power purposes to drive winches, pumps, etc. The engine is cold starting and totally enclosed with forced lubrication to all the moving parts, and operates with the cheapest grades of fuel oil. Compressed air starting equipment is provided including a 3 B.H.P. petrol paraffin engine with air compressor, storage receiver, etc. Another item was a horizontal 4-cylinder Crossley heavy oil engine, 80 brake H.P. at 375 r.p.m., enclosed type, with pump lubrication to the moving parts and occupying small headroom. This type of engine is especially suitable for placing between decks to drive air compressors, pumps, or electric generators for lighting or power to drive ship auxiliaries. The engine is cold starting from compressed air.

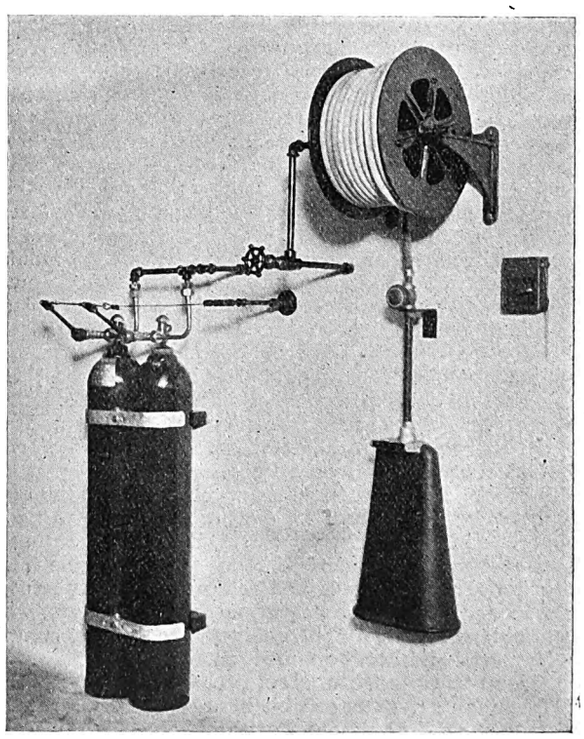
THE DRAYTON REGULATOR AND INSTRUMENT CO., LTD., West Drayton, Middlesex, showed a complete range of automatic regulators, including self-acting water-operated and air operated temperature regulators for controlling valves, also time temperature regulators and temperature regulators actuating more than one valve and one temperature impulse, air and water pressure regulators up to the largest sizes, thermostatic and pressure operated switches, thermo and pressure contactors, automatic humidity regulators, boil feed regulators, dial thermometers, temperature and pressure recorders. A new exhibit was the "Drayton" transmitting boiler and water level indicator.

THE EDISON-SWAN ELECTRIC CO., LTD., 123, Victoria Street, London, E.C. This company showed lamps, cables, stationary batteries and the new Ediswan house wiring systems.

ELECTROFLO METERS CO., LTD., Abbey Road, Park Royal, London, N.W., exhibited a comprehensive range of modern industrial instruments, including typical "Electroflo" all-electric multiple metering systems. These provide, by electrical methods, the continuous measurement of fluid flows, temperatures, pressures, CO_2 percentages and vacua, the necessary records being made on a 12 in. wide, continuous strip chart driven by a synchronous motor clock, and lasting 1 200 hours. The recorders are so designed that no intermingling of records occurs except where such intermingling is characteristic of plant operation.

ALFRED GRAHAM AND CO., LTD., St. Andrew's Works, Slough. The apparatus displayed gave some idea of the application of telephony and amplification of speech. A 2-wire telephone system was included, its purpose being to obviate the use of the usual four-wire connections but at the same time maintaining the four-wire quality and volume of speech. One common source of power supply only is required for signalling and for speech. Another exhibit was a 2-wire "exchange" for use with the two-wire telephone system.





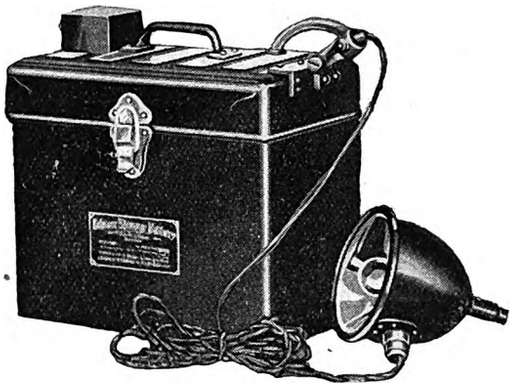
The left hand photograph shows the main cylinder battery of the fire extinguishing system at Barking power station as installed by Walter Kidde & Co. On the right is a typical hose installation by the same firm.**—See next page.**

Digitized by Google

FRIGIDAIRE, LTD., Kingsway, London, W.C. exhibited several of their latest types of automatic electrical refrigerating machines of various sizes.

HADFIELD'S, LTD., East Hecla Works, Tinsley, Sheffield, made a display of their "Hecla" and "Era" brands of heat resisting steels.

INVENTUM ELECTRICAL APPLIANCES, LTD. (Mr. Alan Wright), 124, Chancery Lane, London, E.C., exhibited a range of the well-known "Inventum" electric fires, water heaters and cabin heaters.



The "Nite Box" exhibited by the New Distributors of Edison Storage Batteries, Ltd. See next page.

KELVIN, BOTTOMLEY AND BAIRD, LTD., 18, Cambridge Street, Glasgow. This firm, the original manufacturers of the late Lord Kelvin's nautical and electrical inventions, displayed the latest models of their well-known "Kelvite" navigational specialities and also a number of new developments for marine use. A range of magnetic compasses for the mercantile service included the original Sir William Thomson lightcard compass, the "Kelvite" standard compass, embodying Lord Kelvin patents, a vertical card liquid steering compass, also a liquid steering compass with reduced diameter modern high-pressure boilers. A new departure of Messrs. Kelvin, Bottomley and Baird, Ltd., was a range of medical apparatus for the ship's surgery and hospital. Here was seen a K.B.B. shadowless operating lamp, arranged for use on ship board, an apparatus for sterilising drinking water on an adequate scale by means of ultra-violet radiation. Lamps for radiant heat and artificial sunlight treatment and a portable X-ray outfit.

LACY-HULBERT AND CO., LTD., Boreas Works, Beddington, Surrey, exhibited "Boreas" patent high speed air compressors, designed for running at high speeds direct coupled to petrol engines, electric motors, etc.

LAURENCE SCOTT AND ELECTROMOTORS, LTD., Gothic Works, Norwich, showed electric motors, generators, and control gear specially designed and manufactured for use on board ship, and several types of the "Scott" silent worm-geared winch with contactor controller:—(1) 5A Scott winch, lifting up to seven tons; 3B Scott winch lifting up to four tons; 3BNL Scott winch, with special lever control; D3 Scott winch, motor-generator control. (2) Marine type motors (deluge pattern), drip-proof, splashproof, specially designed for ships' engine rooms, vertical and horizontal patterns. (3) Donkin-Scott "all electric" steering gear. (4) Electrical equipment for windlasses and capstans, including contactor control and motor-reducer control. (5) Electric boat winches, Welin-Maclachlan type. (6) Special barrel starters for engine-room motors, with ratchet handle and circuit-breaker. (7) Contactor starters for ships' motors. (8) Ships' generator.

THE RELAY AUTOMATIC TELEPHONE CO., LTD., Relay House, Streatham Hill, London, S.W.2, exhibited working installations continuously every day throughout the period of the exhibition. All connections on the "Relay" system are made in three seconds, and all conversations are protected from overhearing or interruption. The Relay automatic telephone system is characterised by the use of simple relays, specially designed to possess and retain a fixed adjustment. With the exception of the Relay armatures themselves, which have a standard travel of $\frac{1}{32}$ of an inch, the system contains no moving parts, and needs no lubrication.

THE RAPID MAGNETTING MACHINE CO., LTD., Lombard Street, Birmingham. The exhibit here comprised a range of various types of drum type separators; a high intensity chute separator; lifting magnet, on suitable gantry with lifting tackle; electro-magnetic chuck; a representative size clutch; and a combined high intensity drum and chute separator.

THE YOUNG ACCUMULATOR CO. (1929), LTD., Rigault Road, London, S.W.6, exhibited a range of "Young" accumulators covering ship lighting, marine, wireless, yacht lighting and motor boat starting and lighting. These accumulators, which have never before been exhibited, are filled with electrolyte known as Dry-Power. It is claimed that this electrolyte overcomes all the trouble previously associated with solid electrolytes, and will give greater capacity compared with other batteries. It takes the form of a thick jelly, which replaces the usual acid and is entirely unspillable. By its use, the space usually left above and below the plates can be reduced, and the space occupied by the batteries can be diminished. When it is necessary to add distilled water, this can be done in the usual way. Sulphation is said to be eliminated, and no injury results when the accumulators are left in a discharged condition or even short-circuited over long periods.

THE TELEPHONE MANUFACTURING CO., LTD., Hollingsworth Works, West Dulwich, London, S.E., exhibited a varied collection of telephone instruments and apparatus. The principal display consisted of "Laryngaphone" noise-excluding ship's telephones. A new model loud-speaking telephone for ships and noisy positions in factories was shown. This instrument has been designed to make speech easily audible in the noisiest positions on the deck of a ship or in the engine room.

MESSRS. H. C. SLINGSBY, 89-97, Kingsway, London, W.C. Here was exhibited a selection of about 60 from over 1 900 varieties of trucks, ladders and barrows made and catalogued, including hand and telescopic revolution revolving, electric-driven starters; automatic electric trucks, electric load-carrying trucks, electric elevating platform trucks for loads up to two tons, electric lifting-tiering trucks up to 75 in. for loads up to two tons, and electric trackless tractor-trailer truck trains, electric industrial engines, trackless and for railways.

THE A.C. WELDING CO., City Mills, High Street, Stratford, London, E.15. This exhibit consisted of various types of portable "Alternarc" alternating current arc cutting and welding machines for use with any welding electrode on the market, whether bare or coated. The machines embody the necessary transformers, choke or impedance and regulator as one single unit transformer of special design, housed in a distinctive ruggedly constructed case. The case is provided with sedan handles, so that the plant can be readily carried by two men. The design of transformer, in each instance, is such that high arc stability is present in the arc to meet the varying conditions of load. Means of adjusting the open circuit voltage arc current, shape of characteristic curve, penetrative effect and permissible length are provided to suit the varying conditions of type and size of electrode, class of work being welded, etc.

Extinguishers for Electrical Fires.

WALTER KIDDE AND CO., 2, Victoria Street, London, S.W.1, showed examples of extinguishing systems as installed in many power stations, for dealing with fires in oil switchrooms, transformer vaults, generators, etc., a typical example of which is the plant at the Barking station of the County of London Electric Supply Co., Ltd. We reproduce on page 375 a photograph showing the main cylinder battery of this installation, which is arranged to flood with inert "Lux" gas any of four main switchrooms, four basements or 26 transformer rooms, from a control position outside the rooms affected. This firm also showed examples of hand-applied hose reel units and portable extinguishers, which are useful for extinguishing fire without any damage and without danger to switchboards, electric motors, small oil switches, etc. A typical hose reel installation is also illustrated on page 375. An example of the "Derby" system of automatic electric fire alarm for cabins of passenger vessels formed another exhibit, while the "Rich" system was also on view. This latter enables the presence of smoke in any hold of the ship to be accurately located by means of a detecting cabinet installed in the wheelhouse of the ship. The cabinet is fitted with electric fans for drawing samples of air continuously up from the holds and with special electric light arrangements for rendering the presence of smoke visible.

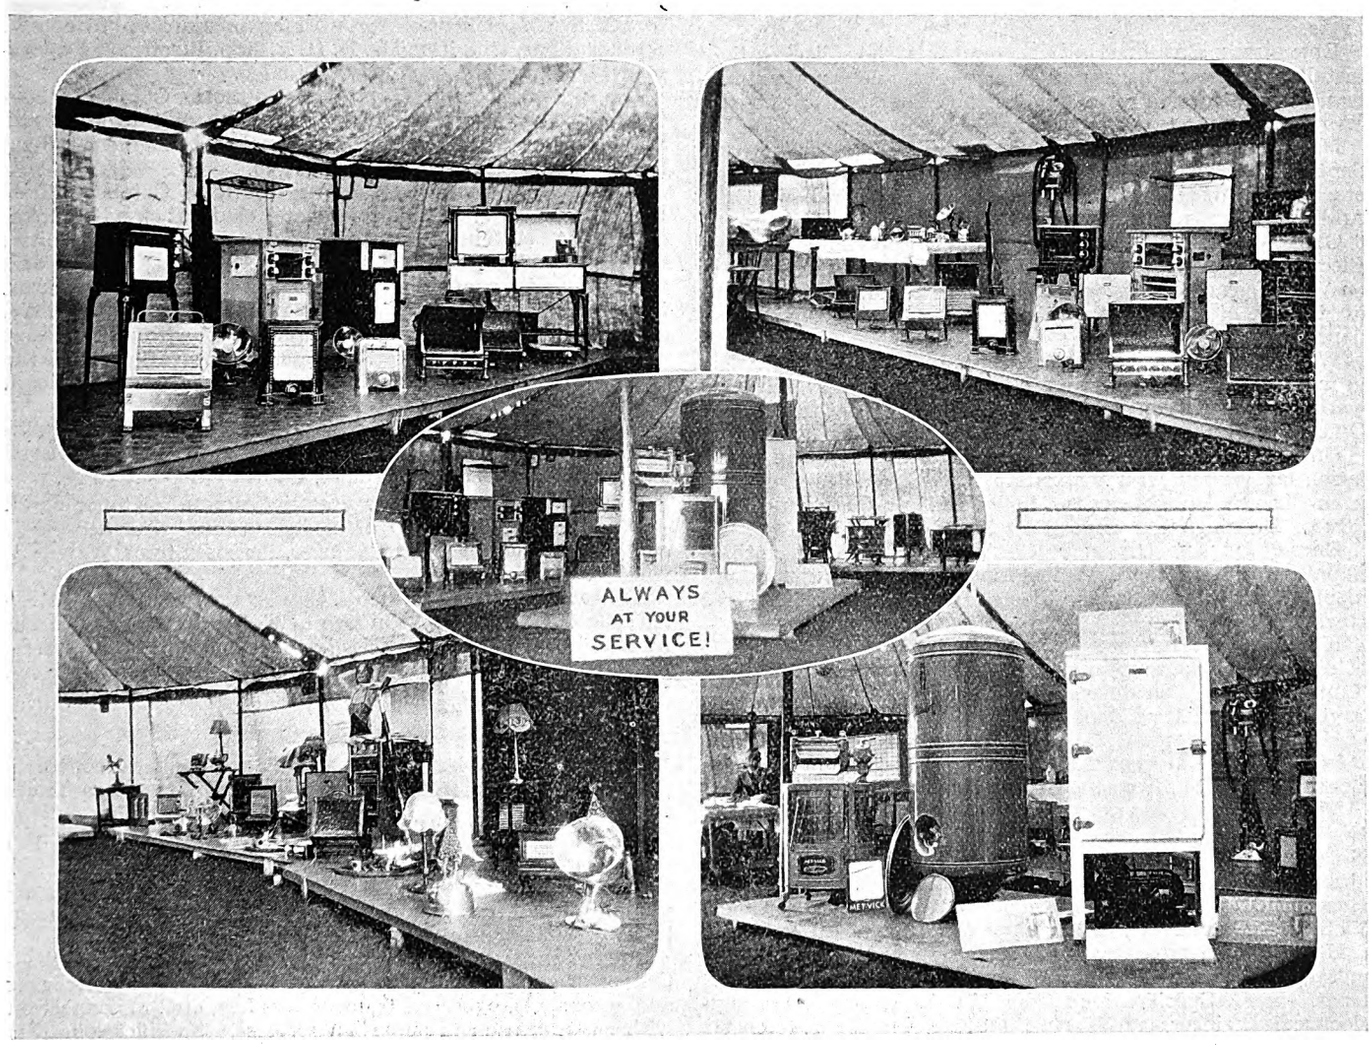
THE RELIANCE TELEPHONE CO., LTD., Magnet House, Kingsway, W.C.2, exhibited a comprehensive display of telephone apparatus in various finishes under working con-

Digitized by Google

ditions. These units are especially designed for use on sea or land where reliability and efficiency is essential. They can be arranged either for full inter-communication, i.e., that every instrument can call every other, or alternatively, partial inter-communication can be made, i.e., certain instruments, are barred from calling certain other stations. Secret lines. staff calls and alarm keys can be fitted to all standard models. G.E.C. automatic telephone exchanges were also shown under working conditions, together with specimens of manual telephone exchanges so arranged that they can be connected up to the land service whenever a boat is in harbour. A luminous indicator system and bell apparatus for ship work was another interesting exhibit. This is one of the latest types of luminous staff signalling equipment which consists of a multiple push in each cabin to call the steward or stewardness. When operated, it will light the corresponding lamp outside the cabin and also in the steward's room and the respective corridor. The steward or stewardess releases the signal when entering the room.

THE A-S REFRIGERATING MACHINES, LTD., Magnet House, Kingsway, W.C.2, exhibited a range of refrigerating gear. The exhibits comprised various sizes of hermetically sealed leakage and explosion proof A-S refrigerating machines and a small marine type A-S ice maker was demonstrated under working conditions.

NEW DISTRIBUTORS OF EDISON STORAGE BATTERIES, LTD., Victoria House, Southampton Row, London, W.C.1. Here was demonstrated the Edison steel alkaline battery made at Orange, New Jersey. Due to its engineering construction, the makers are able to offer, for the Edison battery, practical guarantees of maintenance of capacity during periods extending from 10 to 16 years, according to duty. This cell is stated to have been in use for twenty years, and has, according to the makers, demonstrated its power to stand idle for long periods without loss of charge or deterioration of its nickel-iron elements or alkaline solution. This characteristic makes it especially suitable for yacht-lighting, rudder operation on motor and steam ships, also for sailing vessels, trawlers, motor boats and lifeboats, and for wireless service. The battery has considerable vogue for traction purposes, such as industrial trucks, tractors, locomotives, portable cranes and commercial and municipal vehicles. The exhibitors provided a complete demonstration board which showed step by step the constructional features, and on this stand was also shown the Edison Nite Box, an effective and handy source of illumination, comprising a five-cell Edison storage battery, enclosed in a sheet-steel box heavily japanned and equipped with carrying handles, strong hinges and toggle catch. On one end of the cover is mounted a spot-light containing 12 ft. of extension cord wire automatically wound on a spring reel, a parabolic reflector and a standard 6-8 V bulb of 21 c.p. A rotary switch and means for the accurate focussing of the bulb are provided. A swivel mounting provides for swinging the lamp in any direction, and also allows the disconnection of the lamp from the box for inspection purposes within a radius of 12 ft. A bayonet contact socket is furnished to allow the use of an additional lamp on any length of flexible cord. The Nite Box is wired in a substantial manner, all wires being rubber covered and grouped under the lid. The entire unit is self-contained and readily portable.



RURAL ELECTRICITY.

THE Trent Valley and High Peak Electricity Co., Ltd., exhibited at the Chapel-en-le-Frith Agricultural Society's Annual Show in a marquee 30 ft. by 50 ft. in extent. The photographs reproduced above show the general arrangement of the exhibits. Owing to the fact that the company was able to arrange to take a limited supply at 110 V from the private plant of a prospective consumer, a good proportion of the apparatus was at work. It is estimated that nearly 3 000 people passed through the exhibition and this in spite of the fact that they had previously had to pay 2s. to enter the show grounds, many having come solely to the electricity company's tent.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, where available.

EVESHAM RURAL DISTRICT COUNCIL.—Electric light installation in 78 houses at Broadway, Evesham. Particulars from the Surveyor.

EAST LOTHIAN EDUCATION AUTHORITY, September 27th.—Electrical work in connection with erection of public schools at Longniddry and Aberlady. Forms of tender, etc., from Messrs. Morham and Brotchie, 29, Hanover Street, Edinburgh.

HORSHAM URBAN DISTRICT COUNCIL, September 27th.—Supply and erection of (*a*) rotary convertor, 125 kW step-up transformer, two draw-out truck type e.h.t. switch units; (*b*) sub-station equipment: two 100 kVA transformers, e.h.t. switchgear, l.t. switchboard and cable works; (*c*) one e.h.t. feeder cable, laid complete. Specification, with form of tender, drawings, etc., from the electrical engineer, Mr. F. Ffrench Electricity Works, Horsham, deposit £3 3s. (or £1 1s. for any one section).

E.H.T. Transmission Line.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, September 27th.—Supply and erection of a double circuit, 33 000 V, three-phase, 50 cycle, overhead (steel towers) transmission line. Specification (No. 33/T/1), from Mr. E. F. Hetherington, chief engineer and manager, at the offices of the Authority, Phœnix Buildings, Dudley Road, Wolverhampton; deposit £1 1s.

EDINBURGH CORPORATION, September 28th.—Electric light installations in 48 houses at Quarryholes and 24 at Sunnybank. Specification, etc., ftom the Engineer, Electricity Works, Dewar Place, Edinburgh.

MIDLOTHIAN AND PEEBLES DISTRICT ASYLUM, ROSSLYNLEE, September 28th.—Six months' supply of electrical fittings, etc. Forms of tender from the clerk and treasurer, Mr. C. L. Addison Smith, 19, Heriot Row, Edinburgh.

OTLEY URBAN DISTRICT COUNCIL, September 28th.—Electrician's work in connection with erection of 100 houses on Westbourne housing estate, Bradford Road, Otley. Forms of tender, etc., from the clerk, Mr. C. J. F. Atkinson; deposit £1 1s.

WARRINGTON CORPORATION, September 28th.—Electrical gear in connection with pumping plant for river filtration works. Specification from Mr. J. Gray, Water Engineer's Offices, Warrington; deposit £1 1s.

BIRMINGHAM GUARDIANS, September 30th.—Lighting installation at Witton Hall Institution, Erdington. Specification from Mr. N. W. Greenway, Lloyd's Bank Chambers, New Street, Birmingham; deposit £2 2s.

ERITH URBAN DISTRICT COUNCIL, September 30th.—Supply of h.t. switchgear, transformers and sub-station equipment. Particulars from the Electrical Engineer, Walnut Tree Road, Erith.

KIRKCALDY DISTRICT COMMITTEE, September 30th.—Electrical installations in 30 houses at Thornton and 20 at Lumphinnans. Schedules, etc., from Mr. W. Williamson, architect, Kirkcaldy; deposit £1 1s.

HULL CORPORATION, October 1st.—Road lighting at new infectious hospital known as the City Hospital, Cottingham. Specification, etc., from the City Architect, Guildhall, Hull.

METROPOLITAN ASYLUMS BOARD, October 2nd.—Installation of electric bells at Paddington Casual Ward (Contract No. 6): new storage battery for t.s. "Exmouth" (No. 7); and alterations to electric lighting in "X" block at Eastern Fever Hospital (No. 8). Specification from the Board's Office, Victoria Embankment, E.C.4; deposit £1 for each.

HASTINGS CORPORATION. October 3rd.—Supply of (*a*) 11kV metal clad switchgear; and (*b*) one 5 000 kVA outdoor type transformer. Specifications from Mr. A. J. Ryan, borough electrical engineer, 12, York Buildings, Hastings; deposit £1 1s. for each contract.

GRIMSBY CORPORATION, October 4th.—One year's supply (about 25 000 yds.) of paper insulated, lead covered, low pressure cables. Specification (No. 269) from Mr. S. R. Windle, borough electrical engineer, Electricity Works, Grimsby.

LEEDS GUARDIANS, October 4th.—Electric lighting installation at the two children's homes, Roundhay. Particulars from the clerk, Mr. J. H. Ford, 11, South Parade, Leeds.

HALIFAX CORPORATION, October 7th.—Electrician's work in connection with erection of filter house, etc., for the waterworks department. Specifications, etc., from the Borough Engineer; deposit £2 2s.

GLASGOW CORPORATION, October 8th.—(1) Water-tube boiler plant; (2) 10 000 kW steam turbo-alternator, with condensing plant and auxiliaries; and (3) e.h.t. switchgear and control gear, for Pinkston generating station (separate tenders for each contract). Specifications, etc., from Mr. L. Mackinnon, general manager, Tramways Department, 46, Bath Street, Glasgow.

GREAT WESTERN RAILWAY CO., October 8th—October 25th.—Supply of telegraph instruments (list 18); electrical apparatus (insulators, etc.) (19); electric wires and cables (20); electric lamps (24), etc. Samples and patterns may be seen from September 23rd to 27th at the office of the Stores Superintendent, Swindon, where specifications and forms of tender can be obtained. Forms of tender for list 20 will be issued on October 17th. Tenders for list 20 by October 25th and for other above-mentioned lists by October 8th.

WEST RIDING EDUCATION COMMITTEE, October 8th.—15th.—Electric light installation at Thurlstone New School. Specifications, etc., from the Education Officer, County Hall, Wakefield, until October 8th. Tenders by October 15th.

DUNDEE CORPORATION, October 9th.—Supply of l.t., paper insulated, lead covered and double steel tape armoured cable, to B.E.S.A. specification for working pressure up to 660 V. Specifications, etc., from Mr. D. H. Bishop, Electricity Department, Dudhope Crescent Road, Dundee.

HACKNEY (LONDON) BOROUGH COUNCIL, October 9th.—One 30 000 kW C.M.R. turbo-alternator and exciter, etc. Specifications from the Borough Electrical Engineer, 18-24, Lower Clapton Road, E.5; deposit £30.

HACKNEY (LONDON) BOROUGH COUNCIL, October 9th.—Fourteen 6 600 V, three-phase, metal clad, oil circuit breaker equipments, each not less than 1 000 000 V rupturing capacity; remote electrically-controlled duplicate busbars; cabling and auxiliary gear controlling one 30 000 kW turbo-alternator, two 30 000 kVA transformers, two 15 000 kW reactance links, one 30 000 kVA busbar coupler equipment, with and without reactance, and six 8 000 kW feeders. Specifications from the Borough Electrical Engineer, 18–24, Lower Clapton Road, E.5; deposit £3.

CLUTTON GUARDIANS, October 14th.—Electric light installation at the Institution. Specification, etc., from Mr. J. Wayne Morgan, 9, Mount Stuart Square, Cardiff; deposit £2 2s.

SOUTHWARK (LONDON) BOROUGH COUNCIL, October 22nd.—Twelve months' supply of electric cables. Further particulars from the Electrical Engineer, Penrose Street, Walworth Road, London, S.E.17.

STAFFORDSHIRE EDUCATION COMMITTEE, October 31st.—Electric light installation in two new elementary day schools in Brettell Lane, Brierley Hill. Specification from Messrs. Moffett, Rosher and Mann, Union Chambers, Temple Row, Birmingham; deposit £5 5s.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

DURBAN CORPORATION, September 27th.—Supply of three-phase, ironclad, compound filled switch panels (specification, S. 778). (Reference B.X. 5 505.)

SOUTH INDIAN RAILWAY CO., LTD., September 27th.—Convertor equipment for sub-stations, transformer switchgear and accessories, overhead transmission line, etc., in connection with electrification of suburban services. Specifications (£1) from the Company's Offices, 91, Petty France, Westminster, S.W.1.

EGYPTIAN MINISTRY OF THE INTERIOR, September 28th.—Supply and erection of electric power station for the town of Samannoud (Gharbieh Province). (Reference B.X. 5 596.)

EGYPTIAN MINISTRY OF THE INTERIOR, September 28th.—Machine tools, Diesel and semi-Diesel engines, boilers, electric batteries, etc., for the Prisons Administration. (Reference A.X. 8 245.)

Digitized by Google

MARLBOROUGH (N.Z.) ELECTRIC POWER BOARD, September 28th.—Supply and erection of 600 B.H.P. Diesel-driven generating plant and switchgear. (Reference B.X. 5 556.)

COMPANHIA DOS CAMINHOS DE FERRO PORTUGUESES, September 30th (extension of time).—Signalling apparatus. (Reference A. 8 427.)

EGYPTIAN MINISTRY OF THE INTERIOR, September 30th.—Supply and erection of electric power station, with overhead and underground networks, for the town of Deirout. (Reference B.X. 5 598.)

STATE ELECTRICITY COMMISSION, VICTORIA, September 30th.—Supply and delivery of three 3 000 kVA, 50 cycle, oil immersed, self-cooled, outdoor type single-phase transformers and spare coils and bushing. (Reference B.X. 5 523.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, September 30th.—Twelve months' supply of electric lamps (tender No. 1 526). (Reference B.X. 5 590.)

VICTORIAN ELECTRICITY COMMISSION, September 30th.—Supply of 48 busbar-supporting insulators, for use on three-phase, 50 cycle transmission system, 66 000 V between phases (specification 29/120). (Reference B.X. 5 686.)

VICTORIAN ELECTRICITY COMMISSION, September 30th.—Three 3 000 kVA transformers and spares. (Reference B.X. 5 523.)

VICTORIAN ELECTRICITY COMMISSION, September 30th.—Supply, erection and maintenance of coal conveying plant. Specification (No. 29/68) from the Agent-General for Victoria, Victoria House, Strand, London, W.C.; returnable deposit £2 2s.

WELLINGTON CORPORATION, September 30th.—Electric motors, starters and switchgear, for the Milk Department. (Reference B.X. 5 508.)

EGYPTIAN MINISTRY OF THE INTERIOR, October 1st.—Erection and equipment of electric power station (about 500 kVA), with overhead and underground networks, for the town of Menouf. (Reference B.X. 5 567.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, October 1st.—Supply of electric lamp standards. (Reference A.X. 8 251.)

POSTS AND TELEGRAPHS DEPARTMENT, MELBOURNE, October 1st.—Supply and delivery of switchboard cords. (Reference B.X. 5 515.)

NEW ZEALAND POSTS AND TELEGRAPHS, October 1st.—Supply of bolts, brackets, screws, springs, etc., for British Post Office No. 121 wall telephones and No. 2 receiver switch (Tender No. P. and T., 151/1 700.)

EGYPTIAN MINISTRY OF THE INTERIOR, October 2nd.—Supply and erection of electric power station for Dessouk Town (Gharbieh Province). (Reference B.X. 5 597.)

SYDNEY CITY COUNCIL, October 2nd.—Supply of 6 600 V metal-clad switchgear for Argyle sub-station (specification No. 858; 2s. 6d.); 2 200 V ironclad switchgear for Town Hall sub-station (No. 856; 2s. 6d.); and 1 500 V switchgear for Argyle sub-station (No. 857; 2s. 6d.). Specifications can be obtained from the Chief Engineer, 61, Hunter Street, Sydney, N.S.W.

VICTORIAN RAILWAY COMMISSION, October 2nd.—Supply of a.c. line relays for power signalling. (Reference B.X. 5 563.)

SOUTH AFRICAN POLICE, October 3rd.*—Supply of electric torches, etc. (local indent No. 50.) (Reference C.X. 3 118.)

NEWRY URBAN DISTRICT COUNCIL, October 10th.—Electric lighting of Town Hall and Technical School. Specifications, etc., from the Electrical Engineer and Manager, Electricity Works, King Street, Newry; deposit £2 2s.

Telephone Equipment for Australia.

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, October 15th.—Switchboard instruments, test plugs and sleeves (schedule C. 472). (Reference B.X. 5 541.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, October 15th.—Telephone jacks (schedule No. C. 488). (Reference B.X. 5695.)

JOHANNESBURG MUNICIPALITY, October 17th.—Tramcar motors (contract No. 253). (Reference B.X. 5 664.)

SALISBURY (S. RHODESIA) MUNICIPALITY, October 17th.—Turbo-alternators, steam piping, crane and switchgear (contract 52). (Reference B.X. 5 607.)

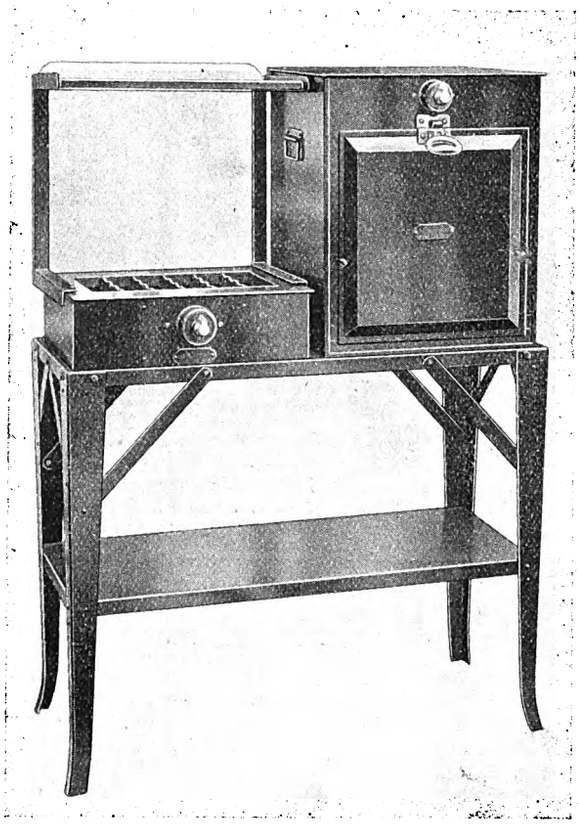
SALISBURY (S. RHODESIA) MUNICIPALITY, October 17th.—Supply of h.t. cables, transformers and sundries, in connection with extensions of the electricity undertaking (contract 53). (Reference B.X. 5 604.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, October 17th.—One 10-ton electric overhead travelling crane (tender No. 1 533) (Reference A.X. 8 463.)

ROUMANIAN GENERAL POST OFFICE, October 18th.—Supply of 31 500 kilos of 3 mm. h.d. copper wire. (Reference A.X. 8 551.)

WELLINGTON CORPORATION, October 21st.—High and low tension switchgear (contract No. 449). (Reference B.X. 5 649.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, October 22nd.—Supply of insulated wire (schedule C. 475). (Reference B.X. 5 580.)



ONE of the new cookers introduced by the Wynsor Electric Range Co., Ltd.

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, October 22nd.—Telephone transformers (schedule C. 474). (Reference B.X. 5 581.)

VICTORIAN RAILWAY COMMISSION, October 23rd.—Dry-core telephone cable (contract No. 43 384). (Reference B.X. 5 638.)

NEW SOUTH WALES GOVERNMENT RAILWAYS, October 29th.—Railway traction motor testing equipment, comprising electric motor, booster, main field excitation generator and short field exciter (quotation No. B.E. 508). (Reference B.X. 5693.)

MELBOURNE CITY COUNCIL, October 30th.—Two 2 500 kW motor-convertors and accessories, or two 2 500 kW rotary convertors, with transformers and accessories. (Reference B.X. 5 570.)

NEW ZEALAND POSTS AND TELEGRAPHS, October 30th.—Head receivers (P. and T. 151/1 725.) (Reference V.X. 5 603.)

JOHANNESBURG MUNICIPALITY, October 31st.—Steel tramway rails, fishplates, manganese points, etc. (contract No. 257). (Reference A.X. 8 523.)

ARGENTINE STATE RAILWAYS, November 4th.—Turbo-generator sets, and headlights for locomotives. (Reference B.X. 5 657.)

AUCKLAND ELECTRIC POWER BOARD, November 4th.—Distribution pillar shells and link units and cable sealing ends. (Reference B.X. 5 682.)

AUCKLAND ELECTRIC POWER BOARD, November 4th.—Low tension porcelain insulators, etc. (Reference B.X. 5 648.)

VICTORIAN ELECTRICITY COMMISSION, November 4th.—Circuit breakers and operation recorders. (Reference B.X. 5 677.)

VICTORIAN ELECTRICITY COMMISSION, November 4th.—Supply of 6 600 V automatic voltage regulators and spares (specification 29/83). (Reference B.X. 5 637.)

VICTORIAN ELECTRICITY COMMISSION, November 4th.—Circuit breaker operation recorders (tender sheet No. 29/111.) (Reference B.X. 5 677.)

THE new showrooms of Allen-Liversidge, Ltd., at 123, Victoria Street, London, S.W.1. The building was at one time the residence of Lily Langtry, the actress.

NEW ZEALAND POSTS AND TELEGRAPHS, November 12th.—Four-conductor telephone operators' cords. (Reference B.X. 5 685.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, November 12th.—Supply of 15 kW generating set for installation on the "Maui Pomare" (tender No. 369). (Reference B.X. 5 683.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, November 12th.—Transmitters and associated parts (schedule C. 476). (Reference B.X. 5 653.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, November 12th.—Receivers and associated parts (schedule C. 477). (Reference B.X. 5 656.)

SOUTH AFRICAN POSTS AND TELEGRAPHS, November 14th.—Supply of 400 000 lb. of hard drawn copper wire, 2 000 lb. of soft drawn copper wire and 2 000 lb. of soft drawn, tinned copper wire (tender No. 173). (Reference A.X. 8 510.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, November 19th.—Supply of telephone generators and motor generators (schedule No. C. 479). (Reference B.X. 5 662.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, November 19th.—Motor generators (schedule C. 486). (Reference B.X. 5 694.)

VICTORIAN ELECTRICITY COMMISSION, November 25th.—Switchgear, for Yallourn power station (specification No. 29/103). (Reference B.X. 5 636.)

VICTORIAN ELECTRICITY COMMISSION, November 25th.—Watt-hour meters, recording instruments and remote metering equipment, for Metropolitan terminal stations and sub-stations (specification No. 29/92.) (Reference B.X. 5 614.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, November 26th.—Vitreous resistances, each consisting of wire element wound in vitreous spool, for telegraph battery feeds (schedule C. 489). (Reference B.X. 5 696.)

WESTERN AUSTRALIA GOVERNMENT, November 29th.—Supply and erection at Perth of (*a*) boiler house equipment, and (*b*) 12 500 kW turbo-generator and condensing plant. Specifications (£1 1s. for each; not returnable) from the Agent-General for Western Australia, Savoy House, Strand, London, W.C.2.

INDIAN STORES DEPARTMENT, December 3rd.—Ceiling and table fans. (Reference B.X. 5 672.)

ARGENTINE NATIONAL SANITATION WORKS DEPARTMENT December 9th.—Supply of 8 electrically driven centrifugal pumping sets, 3 air compressor sets and 20 centrifugal exhausters. (Reference A.X. 8 509.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, December 10th.—Three single-phase, oil insulated, water-cooled transformers, with accessories (section 295). (Reference B.X. 5 600.)

VICTORIAN ELECTRICITY COMMISSION, December 16th.—Oscillographic equipment (specification No. 29/115). (Reference B.X. 5 692.)

Tenders Accepted.

PORTSMOUTH CORPORATION.—English Electric Co., Ltd. supply of four kiosk sub-stations, £1 080.

CHESTERFIELD CORPORATION.—Chesterfield Engineering Co., electric wiring at swimming bath, £11 17s.

DUDLEY CORPORATION.—Cook and Son, electric light installation in 564 dwelling-houses on the Priory Estate, £2 566 4s.

WATLINGTON (OXFORDSHIRE) PARISH COUNCIL.—Watlington Estates Development Co., electric street lighting.

GAINSBOROUGH URBAN DISTRICT COUNCIL.—Worthington-Simpson, Ltd., electrification of the river punping plant, £438.

PAIGNTON URBAN DISTRICT COUNCIL.—A. R. and E. Wallis, electric light installation at School of Science and Art, £39.

MANCHESTER CORPORATION.—Edgar Allen and Co., Ltd., and Titan Trackwork Co., Ltd., tramway special track work.

BARKING URBAN DISTRICT COUNCIL.—A. Reyrolle and Co., Ltd., supply and erection of three panels of switchgear, £822. (Recommended).

HORNSEY CORPORATION.—Hewittic Electric Co., supply of Hewittic balancer, at Oakfield Road sub-station, £1 308. (Recommended).

LEICESTER CORPORATION.—Oerlikon, Ltd., reconstruction of turbine and construction of pipe line, £15 700 (Recommended). English Electric Co., Ltd., also tendered, £17 082.

DUNDEE CORPORATION.—D. J. Macdonald, Ltd., electric light installation in connection with erection of 192 single-apartment, 72 two-apartment, and 44 three-apartment houses, £1 280.

UTTOXETER URBAN DISTRICT COUNCIL.—Power Lines Construction Co., contracts 1, 2, and 2a, £2 807, £7 866 and £1 933, and Crompton Parkinson, Ltd., contract 3, £1 480, in connection with the electricity scheme.

BANGOR (IRELAND) COUNCIL.—Johnson and Phillips, Ltd., cable and transmission line work, £33 000; Metropolitan-Vickers Electrical Co., Ltd., e.h.t. switchgear, £189; G. Ellison, h.t. and l.t. switchgear, £2 192; Chamberlain and Hookham, Ltd., meters, £846.

PORTSMOUTH ELECTRICITY COMMITTEE.—Transformers: English Electric Co., Ltd., four 100 kVA, £84 each, and six 200 kVA, £124 10s. each; Hackbridge Electric Construction Co., Ltd., two 300 kVA, £163 each, and two 500 kVA, £234 each; Western Electric Co., Ltd., supply of magneto switchboard, at mental hospital, £58 10s.

GENERAL POST OFFICE.—Manufacture, supply, drawing in, etc., of cable: Maidenhead-Reading, Callender's Cable and Construction Co., Ltd.,; Sunderland-Sheraton, British Insulated Cables, Ltd.; telephone exchange equipment: Cowley and Headington (Oxford area), and Whitworth (Rochdale area) and Rochdale, Standard Telephones and Cables, Ltd.; Wednesbury (Birmingham), Putney North, Terminus, and Paddington (London), Automatic Telephone Manufacturing Co., Ltd.; Rochdale, G. Clark and Son, Ltd., and Relay Automatic Telephone Co., Ltd.; telephone repeater equipment, Standard Telephones and Cables, Ltd.

CAPE TOWN CORPORATION.—British Insulated Cables (S.A.), Ltd., 25 tons 0·1 stranded h.d. copper wire, £102 12s. 9d. per ton, 3 tons galvanised iron stay wire, £19 per ton; Associated Engineers' Co., Ltd., 10 tons 0·025 stranded copper wire, £103 8s. 6d. per ton; Johnson and Philips, Ltd., 15 miles of insulated wire, £23 3s. per mile; Albert Vaux, Ltd., ½ ton tinned copper binding wire, £124 per ton; F. W. Searle, supply of motors, £1 354 10s.; Hubert Davies and Co., supply of 4 000 single-phase house service meters, of Sangamo type, 17s. 11d. each; A. Reyrolle and Co., Ltd., supply of 11 000 V switchgear, £1 632, and l.t. switchgear, £4 101; Allenwest (S.A.), Ltd., switchgear for New Somerset Hospital, £218 10s., and for premises in dock area, £357 10s. (All recommended.) G. H. Langler and Co., cable, manufactured by Netherlands Cable Works, £1 116 16s. 11d. (Recommended.) (Lowest British tender: Paul Gregson and Urquhart, for cable made by Craigpark Electrical Co., £1 243 10s. 11d.)

WORK IN PROSPECT.

ASHTON-UNDER LYNE.—Housing scheme (92). Particulars from the Borough Surveyor.

BEXLEY.—Houses (62), Westwood Lane, Welling, for Mr. T. H. Jones.

BRISTOL.—Extensions, female sick block, Eastville Institution. Particulars from the clerk, Mr. Thomas S. Lamb, St. Peter's Hospital.

BURNLEY.—Housing scheme (120). Particulars from the Borough Surveyor.

RICHMOND (SURREY).—Bank extensions, Westminster Bank. Particulars from Brewer, Smith and Brewer.

ROMFORD.—Four schools. Particulars from the Director of Education, Chelmsford.

ROTHERHAM.—Houses (40), Thrybergh, for the Rural District Council. Particulars from contractors, Messrs. R. Snell and Sons, Ltd.

SHANKLIN.—Additional housing scheme, for Urban District Council. Particulars from Surveyor.

SITTINGBOURNE.—Additional 60 houses. Particulars, the District Surveyor.

SLOUGH.—Church and Sunday schools, Stoke Poges Lane, for Mr. W. C. Edwards.

SLOUGH.—Secondary school, and extensions to Montem School. Particulars from Education Architect.

SOUTH MIMMS.—Houses (120). Particulars, the Grosvenor Construction Co.

SOWERBY BRIDGE.—Development of Willow House Estate for houses, for Helliwell and Shaw.—Houses (18), for Mr. E. Richardson.

SPENNYMOOR.—Cinema theatre to cost £10 000. Particulars from Mr. Arthur Vasey, Tivoli (Spennymoor) Ltd.

STOCKTON-ON-TEES.—Sunday schools. Particulars, Mr. J. C. Watson.

ST. AUSTELL.—Hotel. Particulars from architects, Messrs. Andrew and Randall.

ST. HELENS (LANCS).—Bank, Hardshaw Street, for the Union Bank of Manchester, Ltd.

ST. HELENS.—Maternity hospital block, etc. Particulars from the architects, Biram and Fletcher, 17, George Street.

THORNE.—Schools. Particulars, Education Architect, County Hall.

WAKEFIELD.—Housing scheme (64). Particulars, Mr. H. Plewes, Council Hall.

WATFORD.—Grammar school extensions. Particulars from clerk, Mr. Frederick Wilson, 7, Church Street.

WELWYN GARDEN CITY.—Hospital. Particulars, the Secretary.

WESTGATE-ON-SEA.—School, for Roman Catholic Managers, Particulars from Correspondent, Tower House.

BATTERY SALES.

Details of the "Exide Fortnight"—Competitions for Trade and Public.

THIS year the CHLORIDE ELECTRICAL STORAGE CO., LTD., has extended the customary "Exide Week" into double that period, October 7th to 19th, and definite schemes are in operation to induce wireless users and car owners to choose and buy "Exide" batteries during the "fortnight." These plans, besides resulting in an immediate improvement in sales, will provide valuable propaganda. This will be consolidated and maintained by an extensive national advertising campaign, which the Chloride Co. has already decided upon.

Two schemes to secure record sales during the fortnight have been prepared. These are, for the trade, an "Exide" window display competition with over £200 in cash prizes; and, for the buying public, a limerick competition with over £1 000 in prizes. The first prize in the limerick competition is an "Essex Challenger" six-cylinder coach priced at £250, and there are 124 other prizes consisting of wireless sets, loud speakers, trickle chargers, other wireless accessories, and batteries for wireless or cars.

Full details of the window display competition are contained in a specially prepared illustrated folder obtainable from the Chloride Co., Clifton Junction, Manchester. The limerick competition is a new departure and the trade must inevitably benefit, because the qualification for entrance is the purchase during "Exide Fortnight" of an Exide battery or trickle charger. The competition is being advertised all over the country, and competitors can obtain competition entry forms on which the limericks to be completed are printed only from "Exide" dealers.

TRADE PUBLICATIONS.

MESSRS. JAMES MILLS, LTD., of Bredbury, near Stockport, have issued a new folder relative to grooved pins.

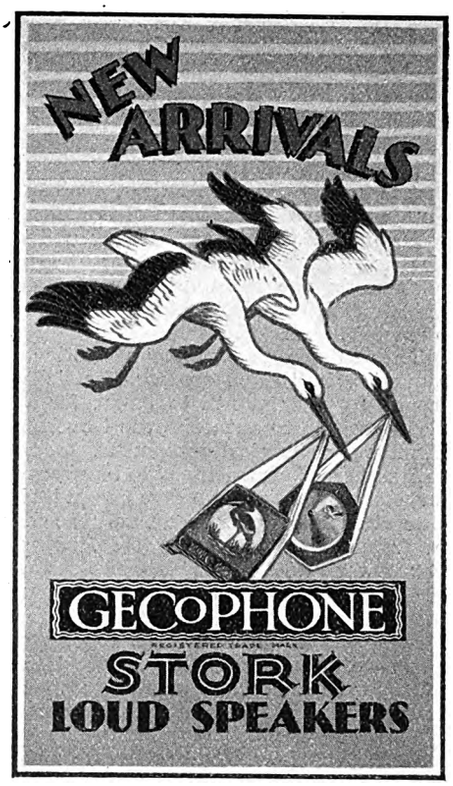
We have received from FRY'S (LONDON), LTD., 24/26, Water Lane, London, E.C.4, a new leaflet dealing with "Enox-It" hack-saw blades.

Aerial cable unions form the subject of publication P. F. 58, just received from BRITISH INSULATED CABLES, LTD., of Prescot, Lancs.

Book 7, section 4A, dealing with the unification of workmen's recorders, has been published by GENT AND CO., LTD., Faraday Works, Leicester.

The BRUSH ELECTRICAL ENGINEERING CO., LTD., Falcon Works, Loughborough, has issued new brochures dealing with liquid starters.

SIMPLEX CONDUITS, LTD., Garrison Lane, Birmingham, have issued a special mailing letter relative to industrial and street lighting reflectors.



A new show card issued by the General Electric Co., Ltd.

Among the latest literature of J. H. TUCKER AND CO., LTD., of Kings Road, Tyseley, Birmingham, is folder F. 2, describing fuseboards in iron and teak cases.

A copy of list No. 617, concerning "Sunstar" reflectors, has been received from FALK, STADELMANN AND CO., LTD., of 83/93, Farringdon Road, London, E.C.1.

Among the latest publications of A. P. LUNDBERG AND SONS, LTD., is leaflet E.77 which deals with multiple water-control switches for aeroplanes, motor boats, etc.

A special leaflet has been issued by STERNOL, LTD., of Royal London Square, Finsbury Square, London, E.C.2, dealing with "Cooloricid" for the prevention of overheated bearings.

"What you can get for £4," is the title given to a mailing card issued by the CAMBRIDGE INSTRUMENT CO., LTD., 45, Grosvenor Road, London, S.W.1. The subject-matter deals with a complete lamp and scale outfit.

Cab tyre sheathed cables are the subject of a new publication by CALLENDER'S CABLE AND CONSTRUCTION CO., LTD., Hamilton House, Victoria Embankment, London, E.C.4. A special leaflet relative to "Anchor" adhesive tape has also been issued.

"Induced Draught and Fuel Dust Arresting" is the title given to a new publication of JAMES KEITH AND BLACKMAN CO., LTD., 27, Farringdon Avenue, London, E.C.4. Catalogue No. VI, dealing with volume fans, has been reprinted in revised form.

The STANDARD WET BATTERY CO., 184/188, Shaftesbury Avenue, London, W.C.2, has issued a new booklet dealing with the company's new cartridge cells. Literature regarding radio testing instruments, "Star" loud speaker units and wet batteries is also available.

The MARTINDALE ELECTRIC CO., LTD., The Hyde, Hendon, London, N.W.9, has issued further literature concerning armature air gap gauges and coil tapping tools for armature repairs, mica slotting files, commutator cements, and the "Martindale" electrical etcher.

Recent publications of the MULLARD WIRELESS SERVICE CO., LTD., Charing Cross Road, London, W.C.2, include leaflet W.A. 19/1A, dealing with "C" type loud speakers, W.A. 12/1A relative to the "P. 17" grid leak, and W.A. 17/2A describing the combined grid leak and condenser holder.

ELECTRICITY SUPPLY.

Fresh Negotiations for Sale of Peterborough Undertaking—Southend Corporation Refuses to Defy Commissioners—Dover Committee Favours Bulk Supply—Irish Municipalities Oppose Valuation Charging.

HULL Corporation has received sanction to a loan of £79 000 for extensions of its electricity undertaking.

It is stated that Peterborough Corporation is about to negotiate with a syndicate for the sale of its electricity undertaking.

The new electricity supply for the Barnoldswick area, which is being obtained from Nelson Corporation, was switched on last Saturday by Mr. A. Carr, chairman of the Council, and Mr. J. S. Windle, chairman of the Electricity Committee.

Torquay T.C. has applied for a Special Order to supply electricity in the urban district of Ivybridge and to certain parishes in the rural districts of Kingsbridge and Totnes. The Council has also decided to oppose a similar application by Mr. W. G. Heath.

The Ontario Government's election manifesto promises a reduction in the charge for electricity supplied to farmers from $4·55 per month to $2·50, for a 100-acre farm. It is also proposed to authorise the Government to lend money to farmers for electrical equipment.

A supply of electricity is to be given to the Hockley Heath and Lapworth district before the end of the year by Birmingham electricity department, and the charges for lighting will be from 6½d. to 4½d. per kWh, according to consumption. For power and heating the charges will range from 2d. to 1¾d., and for water heating for domestic purposes the price will be ¾d.

Members of Southend T.C., at a meeting of the Council last week criticised the action of the Electricity Commissioners in postponing the inquiry concerning additional plant, and the Electric Lighting Committee recommended the purchase and installation of machinery costing £210 000, without waiting for sanction, the amount to be paid out of revenue or reserve. The proposal was rejected by 23 votes to 9.

Burton-on-Trent T.C. is to extend the mains to Hartshorne from Woodville, and to lay a duplicate main from Woodville to the Milton Waterworks at an estimated cost of £6 392 12s. 9d. Provided there is a guarantee of revenue up to £200 per annum, an extension is to be made to Anslow at a cost of £847 13s. 8d., and also to Stanton at an estimated cost of £831 2s. 4d.

At a recent sitting of the Valuation Committee of the Stewartry County Council the Dalry Electrical Supply Co., Ltd., appealed against the assessment of its engine house, machinery, and mains, and asked for a reduction from £155 to £50. The assessor said he did not know of any reason why a small electrical undertaking should be on a different basis than a large one. He consented to a reduction of the valuation to £139.

An objection is to be lodged by Chailey R.D.C. against an application by Johnson and Phillips, Ltd., for a Special Order to supply electricity in the Council's area, on the ground that part of the parish of Ditchling is included in the area of the Central Sussex Electricity, Ltd., and should be withdrawn, and that portions of the parishes of Beddingham, Glynde, Hamsey, Ringmer and West Firle should be included in the compulsory area.

At a recent sitting of a Commission to consider the application of Douglas (Isle of Man) T.C. for permission to supply electricity to parts of the parish of Onchan, including the Howstrate Estate, the Manx Electric Railway, Ltd., claimed to have legal rights to supply electricity on the Howstrate Estate, from which £1 200 a year was derived. Mr. Kneen, for the Corporation, contended that the Railway Co. had the right to use the estate for the purposes of the railway only.

Glasgow Corporation has granted sanction to the district engineer, Central Electricity Board, to the laying of an auxiliary pilot cable in connection with the Central Scotland Electricity Scheme, to connect (1) the Dalmarnock and Port-Dundas power stations with the Yoker power station of the Clyde Valley Electrical Power Co.; (2) the Yoker station with the Blackhall station of Paisley Corporation; and (3) the Dalmarnock station with the Cambuslang station of the Clyde Valley Electrical Power Co.

Mr. J. S. Highfield has reported to Dover Electricity Committee on a proposal of the Central Electricity Board to give the Corporation a bulk supply at not exceeding £3 17s. 6d. per kW of maximum demand, plus 0·2d. per kWh, subject to a coal clause. Mr. Highfield states that he can see no better way of providing for the future on the general lines of this offer. The Committee recommends the Corporation to agree to the proposal in principle, and has asked Mr. Highfield to negotiate further with the Board and report again.

At a recent meeting of Bradford Gas Committee a report was presented with reference to damage to a gas main which is said to have been caused by the fusing of an electric cable, and the Gas Engineer was instructed to take the matter up with the City Electrical Engineer with a view to co-operation between the two departments regarding the laying of mains.—The Electricity Committee recommends the extension of e.h.t. mains from Valley Road power station to Roundhill Street transformer chamber, and the provision of a transformer chamber in Bowling Old Lane district, etc., at a total cost of £24 000.—The Committee has agreed to the proposal of the Yorkshire Electric Power Co. to give a supply to the Leeds Fireclay Co. in the Tong Lane district.

At the Ministry of Transport inquiry by Mr. F. Gordon Tucker, at Eastbourne recently, the Central Electricity Board's proposal to erect overhead lines between Brighton, Eastbourne and Hastings was opposed by the East Sussex County Council, Eastbourne Corporation and other district authorities, on the ground of disfigurement of the countryside and town approaches by the suggested line of 285 steel lattice masts eighty feet high, with an average span of 900 feet. Mr. O. L. Sherrard, for the Central Board, asked the Ministry to sanction the official scheme, which had been carefully designed in furtherance of the Government's national plan of electricity supply. The opposition, he said, was from a few local bodies and was narrow and selfish. Mr. Seagar, for local areas other than that of the East Sussex County Council, said there was nothing in the Act to say the supply was to be overhead.

At the sitting of the Irish municipal authorities in Cork, on September 11th, exception was taken to basing charges for electricity supplied by the Shannon scheme on valuation instead of on the consumption per kWh. The mayor of Clonmel (Ald. Condon) said the charge on the basis of valuation was not equitable, because the valuation varied very much in the different towns and cities. Mr. T. D. Donnelly (Waterford) said that if the Electricity Board were going to ignore the wishes of the people the Shannon scheme had no hope of success. In the city of Waterford hundreds of people had got their houses wired, but when they heard the basis of the proposed charges they made up their minds that they would let those installations go by default. Mrs. Kettle (chairman, Rathmines U.D.C.) urged that the public should be supplied either on a flat rate or under the valuation system. It would appear that, under the valuation system, they would pay at least double, unless they used a very large amount of electricity. A resolution was passed asking for the alternative system of payment, according to the wishes of the consumers, and the fixing of a uniform charge per lamp for public lighting.

Mr. F. X. Algar, director of public lighting contracts to the Irish Free State Electricity Supply Board, attended a recent meeting of Limerick Corporation Electricity Committee, called to consider the question of lighting the city entirely by electricity. Mr. Algar said there were 507 gas and 53 electric lamps in the city. There were in the city at the present time certain net-works put up by the Electricity Supply Board which were available for public lighting. If the Corporation were satisfied with his price he would have the net-work system established in the whole city. When the Board's system came into operation the Corporation could cut out 200 gas lamps, which gave 24 000 c.p. against 122 000 c.p. from the 356 lamps, which he would provide within two months. In addition to the 53 lamps at present in existence, gas lighting was now costing £2 616, and he proposed to give 356 electric lamps, plus 53 at present, for £1 031 13s. 4d. He would give 409 electric lamps for £2 561 and more than that number if they had the poles erected. He would guarantee to supply the Corporation next year with a minimum 800 electric lamps without exceeding the estimate (£4 000) for public lighting this year. The matter was referred to a special meeting.

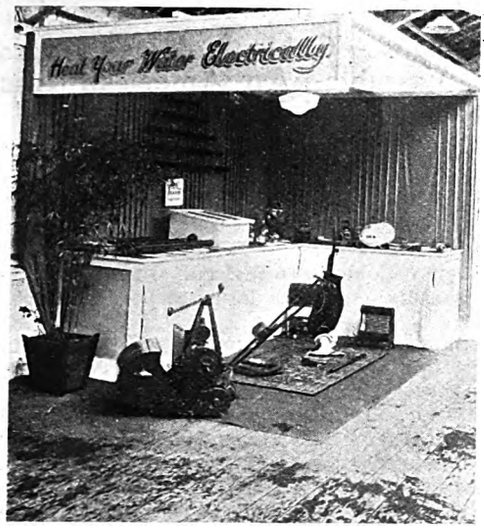
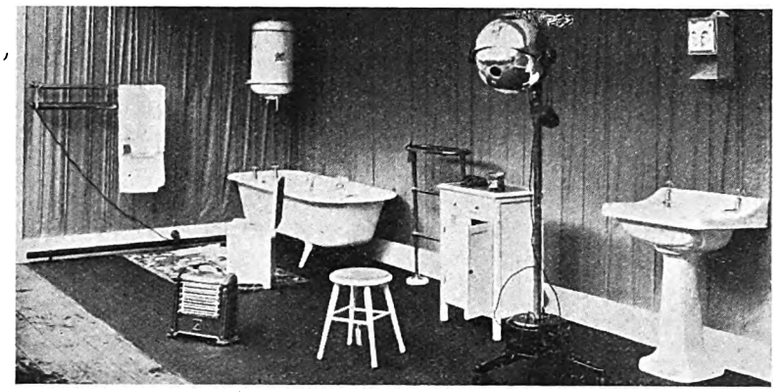
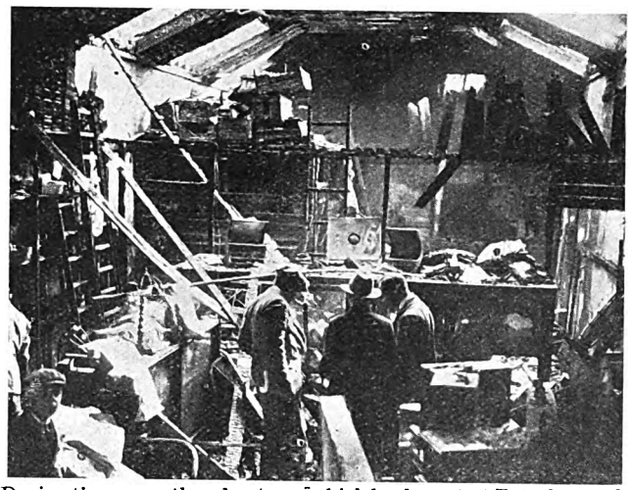
ELECTRICAL NEWS OF THE WEEK IN PICTURES.





A system of tubular heating for conservatories and an electrically-operated lawn mower were features in a well staged display by Birmingham Electric Supply Department at the annual flower show promoted by the "Birmingham Gazette" and held at Bingley Hall, Birmingham, recently. The department's exhibit also included model dining rooms and a lounge, bathroom and kitchen, in each of which the uses of electricity were demonstrated in a practical manner. There were also on view appliances for water heating, room heating, washing, cooking, etc. These two photographs of the exhibit are typical of the well laid out arrangement.

The Lord Mayor of Cardiff opening the new local showrooms of the General Electric Co., Ltd., last week, by switching on the light by means of a photo-electric cell. To his left may be seen Mr. W. E. Hobbs, manager of the Cardiff Branch, and to his right Ald. Snook and Mr. M. J. Railing, joint managing director of the G.E.C. See page 358.



During the severe thunderstorm which broke out at Peterborough last week the premises of Northants Electrical Installations, Ltd., were struck by lightning and, as this picture shows, considerable damage was done by fire following the hit. Many of the electric heaters and other appliances which were on show may be recognised among the debris.

A general view of the National Radio Exhibition which opened at Olympia, London, on Monday. The exhibition is this year larger than ever. From the popular point of view the most important feature of the exhibition is that for the first time loud speaker demonstrations are being given and the public thus have an opportunity of judging the merits of apparatus by audible tests. This important innovation, which overcomes one of the drawbacks of previous shows, has been made possible by the construction of a number of "sound-proof" demonstration rooms round the hall. The loud speakers used in them are fed from a common apparatus controlled by the B.B.C. thus eliminating the possibility of a multitude of different receiving sets producing mutual interference. See page 369.

COMPANY NEWS.

Electrical Descriptions Not Seriously Hit by Hatry Collapse—Cable Holdings Improve—Manufacturing, Supply and Communication Interests Variable—An American Insulating Materials Combine—Company News, Reports and Dividends.

THE market for electrical shares shows, despite the Hatry collapse, a number of substantial rises in the manufacturing section. Henley's are up to £6 13s. 9d., 6s. 3d. higher than a week ago; British Insulated Cables have risen 2s. 6d., and Callender's 1s. 3d. English Electric 6% preference are 7½d. higher at 8s. 9d., and Crompton-Parkinson 6% preference 3d, higher at 17s. 9d. General Electrics are 1s. 3d. down, as also are Ever Readies, and, in the lighting and supply section. Metropolitan ordinary, Cables and Wireless "B" have dropped sharply to 60, and Marconi's Marine are 2s. 6d. lower at 57s. 6d.

BURNDEPT WIRELESS (1928), LTD.—Transfer books are closed until Sept. 30, inclusive.

BRITISH ALUMINIUM CO., LTD.—Intm. div. of 4% actual, less tax (same as last year) on ord. shs. will be payable on Oct. 1.

ELECTRIC SUPPLY CORPORATION, LTD.—Intm. div. at rate of 8% p.a., less tax (same as last year) on ord. shs. is announced.

ELECTRICAL FINANCE AND SECURITIES CO., LTD.—Intm. div. of 4%, less tax, on ord. shs. (same as last year) will be payable on Sept. 30.

PARKER, WINDER AND ACHURCH, LTD.—Intm. div. at rate of 5% p.a. on ord. shs. for half-year ended June 30 (same rate as last year) is announced.

ASSOCIATED FIRE ALARMS, LTD.—Div. of 8%, tax free, on ord. shs. for year ended June 30, 1929 (same rate as last year), will be payable on Oct. 9.

FOLKESTONE ELECTRICITY SUPPLY CO., LTD.—Intm. div. at rate of 8% p.a., tax free (same as last year) on ord. shs. for half-year will be payable on Oct. 1.

BRUCE, PEEBLES AND CO., LTD.—Div. at rate of 7½% p.a., less tax, on the 7½% cum. participatg. pref. shs. for half-year ended June 30, 1929, will be payable on Sept. 30.

MIDLAND ELECTRIC CORPORATION FOR POWER DISTRIBUTION, LTD.—Transfer books will be closed from Oct. 1 to 14, inclusive, for preparation of pref. and ord. div. warrts.

DIRECT SPANISH TELEGRAPH CO., LTD.—Div. for half-year to June 30, 1929, at rate of 10% p.a. on pref. shs. and intm. div. of 4%, tax free, on ord. shs. will be payable on Oct. 1.

KUCHENMEISTER INTERNATIONAL WIRELESS CO.—This company, a subsidiary of the Kuchenmeister International Co. for Acoustics, has been formed in Amsterdam with a cap. of £200 000.

TELEPHONE COMPANIES' ARRANGEMENT.—It is reported that the L.M. Ericsson Telephone Co.'s Mexican subsidiary has arrived at an agreemt. with the Bell Telephone Co. of America with regard to telephones in South America and Mexico.

PHILIPS' GLOWLAMPWORKS, LTD.—An issue of £1 300 000 ord. shs. at 120% and £440 000 cum. pref. shs. at 130% to hldrs. in proportn. of three old shs. to one new was announced on Tuesday. The new shs. are entitled to a qrtr. of the 1929 div. This will make total cap. £5 200 000 ord. and £1 770 000 cum. pref. shares.

OFFICIAL QUOTATIONS.—Official quotations have been granted by the Stock Exchange Committee to £344 916 7½% non-cum. "A" ord. stk., £198 083 "B" ord. stk., and £275 892 5½% cum. pref. stk. of Cables and Wireless; and 4 626 £1 fully paid ord. shs. of Underground Electric Railways Co. of London, Ltd.

POWER CORPORATION OF CANADA.—Accts. for year to June 30, 1929, show increase of over $1 000 000 in net earngs. of $2 846 418 compared with previous twelve months. Int. $400 589, pfd. stk. div. $680 000, div. on common stk. $394 842; disct. on deb. issued $550 000. Blce. at credit raised from $1 681 932 to $2 502 919.

NORTH METROPOLITAN ELECTRIC POWER SUPPLY CO.—Rev. for 1928, £1 034 619; balance to net rev. acct., £373 517. Int. on mtges., tempy. loans and deb. stk., £37 506; to res. for 5% mtges. £2 000; to redemptn. fund, £8 750; to res. acct., £120 705; div. on 6% cum. pref. shares to Dec. 31, 1928, £69 000; div. on ord. shares at rate of 10% p.a., £127 500; fwd., £28 202.

UNITED STATES ELECTRIC POWER CORPORATION.—In conjunctn. with American Founders' Trust, Equitable Trust, and certn. other American interests, Hydro-Electric Securities Corporation has formed the United States Electric Power Corporation, with cap. of 2 000 000 "A" shs. of no par value and 4 000 000 common shs. of no par value. The Hydro-Electric Securities Corporation holds 1 300 000 shs.

AMERICAN INSULATING MATERIALS COMBINE.—It is reported that the Johns-Manville Corporation, the Insulite Co., and the United States Gypsum Co., which have combined assets of $250 000 000, have formed a cartel, under which their distributing facilities at home and abroad will be pooled. The companies control a number of mines, electric power plants, railways, etc., and they have a big export business.

Digitized by Google

COMPANIA DE ELECTRICIDAD DE LA PROVINCIA DE BUENOS AIRES, LTD.—Hldrs. of coupons No. 36 attached to 5% 1st mtge. gold bonds, payable on Oct. 1, will receive payment at rate of 8s. p. coupon, tax free, provided that they are domiciled in United Kingdom and subject to British income-tax, on presentation of such coupons at the offices of Messrs. Binder, Hamlyn and Co., River Plate House, 12-13, South Place, London, E.C.2.

QUEBEC POWER CO.—Div. on common shs. of $\$\frac{5}{8}$ p. sh. for qrtr. ended June 30, 1929 (agst. $\$\frac{1}{2}$ p. sh. last year), will be payable on Oct. 15.—Shhldrs. are offered right to subscribe for an issue of common shs. of no par value at $50 p. sh. in proportn. of one new sh. for every ten old shs. held. Paymt. must be made to Aldred and Co., 24-28, Lombard Street, London, E.C.3, on or before Nov. 30. The new stk. will rank for divs. payable Jan., 1930, in respect of qrtr. ending Dec. 31, 1929.

COMPANIES TO BE STRUCK OFF THE REGISTER.—The following companies will be struck off the register, unless cause is shown to the contrary, before Dec. 13: Aladdin Lamps (Midlands), Elec. Car and Accessories Co., Farad Electrical Co. The following will be struck off the register unless cause to the contrary is shown before December 17th: General Battery Co.; Midland Radiotelephone Manufacturers; N.S. Battery and Equipment Co.; Winsum Electric Diffusers. It is also intended to remove the following companies from the register unless cause to the contrary is shown before December 20th: Auto-Sign Co., Skipton Electrical Co., Wireless Distributing Co.

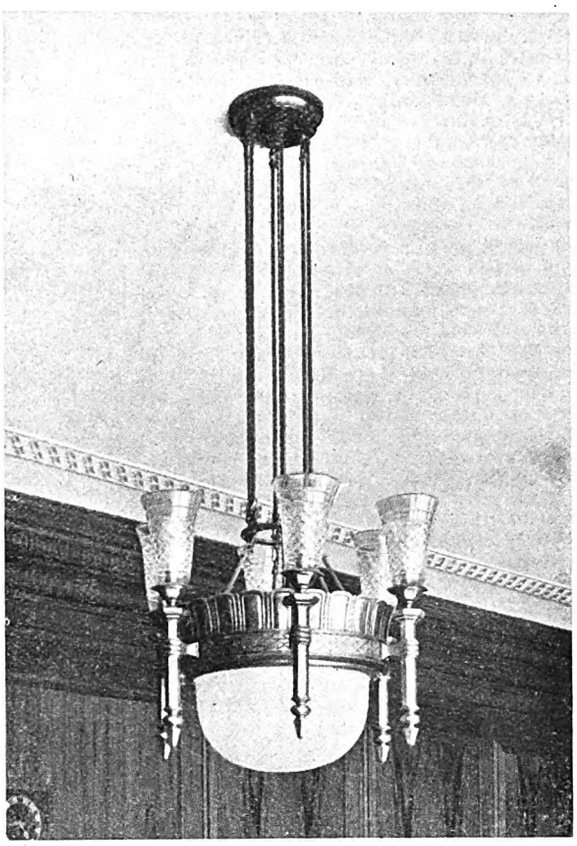
AMERICAN ELECTRICAL INVESTMENT COMPANIES.—A plan is to be submitted shortly to the shhldrs. of the Electric Bond and Share Co. and Electric Investors for the former company to take over the assets of the latter, on the basis of 8 shs. of common stk. of the former for each 5 common shs. of the latter. Hldrs. of pfd. stks. of Electric Investors are to receive pfd. stk. of Electric Bond and Share Co. on a sh. for sh. basis or $100 in cash and accumulated divs. The Electric Bond and Share Co. controls American and Foreign Power, which owns the bulk of the common stk. of companies supplying electric power and light, etc., in several South and Central American republics, and has also large interests in electrical undertakings in Canada, Italy, France and Germany.

SOUTHERN BRAZIL ELECTRIC CO., LTD.—Accts. for 1928 show loss of £3 530, compared with pft. of £9 055 for precedg. year. Pfts. earned in Brazil were £13 809, agst. £16 414, and income from investmts. in Brazil was £58 137, agst. £42 823. Loss is due primarily to amt. demanded by amortisatn. agreemt. of 6½% mtge. debs. made in 1927 (£13 500) and int. on £200 000 7% prior lien deb. stk. issued August, 1927. Int. has been paid in full on that stk., and also int. on original 6% deb. bonds at increased rate of 6½%, part of which has been met by moneys from issue of £200 000 of prior lien stk. The several undertakgs. in which company is interested continue to show satisfactory progress in currency rev. in almost every directn. So far the negotiatns. with municipal authorities for revisn. of rates to which subsidiary companies are in justice entitled in consequence of depreciatn. of Brazilian currency, which has increased the cost of maintenance and operatn., have not been concluded. The mtg. was held on Sept. 20 in Brazil.

BRITISH COLUMBIA TELEPHONE CO.—Operatg. rev. for year ended March 31, 1929, $4 768 312; maintenance, operatg., taxes, etc., absorbed $2 759 671; amt. placed to employees' benefit fund was $39 753, and depreciatn., $906 102; leavg. $1 062 784. Deb. int., $88 204; employees' savings plan int. $6 351; pension fund, $60 000; sinkg. fund. $24 234; divs. on ord. shs. $360 000, on pref. shs. $60 000; and on pfd. shs., $270 000; fire loss res., $20 000; blce., transferred to surplus, $98 995. At March 31, 1928, number of telephones in use was 102 010, and at March 31, 1929, 109 301. Company has under way engineering surveys with a view to conversn. of its metropolitan areas to dial system working. Result of these studies so far has warranted setting up plans to convert complete Victoria network, which will be cut over about July, 1930. Victoria has been selected for first conversn., principally due to the fact that large expenditures would have to be made for additional manual equipmt. and one or more central offices.

Company Meeting.

CROMPTON PARKINSON, LTD.—Mr. E. F. Parkinson, presiding at the meeting on September 19th, said the net profit during the twelve months ended June 30th, 1929, after provision for depreciation, interest and all other charges, was £82 572, compared with £70 826 for the previous financial period of fifteen months. The total sales of the company's products had exceeded those of any previous period; the net trading profit was the highest ever recorded, and their unexecuted order book at the close of the financial year was the largest they had ever had. The net profit, after providing for the dividends on the first and second preference shares,



ONE of the fittings recently installed by Messrs. Best and Lloyd in the Board room of the Permanent Co-operative Building Society's new headquarters, New Oxford House, London.

amounted to £49 308, equivalent to nearly 50% on the nominal amount of the ordinary share capital. In deciding the conservative recommendation of a final dividend on the ordinary shares of 18¾%, making 30% for the year, the board had borne in mind the proposal to make a further issue of ordinary shares, to which he would refer later. The sum of £12 000 which had been written off for depreciation this year was in excess of the normal depreciation written off in previous years. In order to maintain their manufacturing plant at the highest standard of efficiency the directors were pursuing the policy of installing the most up-to-date automatic machine tools and other equipment, and had decided to increase the amount written off as depreciation to cover the plant superseded. During the year they had repaid the whole of the debentures outstanding, amounting to £83 800. A complete review of the world's markets for electrical machinery and a careful consideration of the trend of future developments in electrical engineering showed that in certain directions the redesigning of certain lines and the introduction of new lines of manufacture were necessary. This work had been actively pursued during the past year, with the result that the company's products to-day represented the highest standard of manufacture in their respective lines, and were the leaders in many directions. The output from each factory had this year been the highest ever recorded, notwithstanding the abnormally large amount of development work which had been proceeding. The board considered that the employees' share scheme, started in 1919, was not achieving the object for which it was introduced, and therefore decided it should be discontinued. All the shares issued had been converted into 8% first preference shares, ranking *pari passu* with the other shares in this class. The board had decided to extend to the employees at Chelmsford the superannuation scheme which had been in operation at

Digitized by Google

their Guiseley factory for some years. The board had decided to ask the shareholders to create for issue 200 000 ordinary shares, nominal value 5s. each, which would be offered to the existing ordinary shareholders at 10s. each in the ratio of one new share for every two shares at present held. The report was adopted, the dividends were approved, and the election of Col. R. E. Crompton as a director was confirmed.

New Companies.

L. CADEC, LTD.—Cap., £100. Electricians, etc. Reg. Office: 27, Greek Street, London, W.1.

R. DARBYSHIRE (WHOLESALE), LTD.—Cap., £2 000. Electricians, electrical and mechanical engineers, etc. Reg. Office: 2, St. John's Walk, Abingdon Street, Blackpool.

WALSALL HARDWARE MANUFACTURING CO., LTD.—Cap., £200. Electrical engineers and machinists. A permanent director: A. E. Read (man. dir.), Oakdale, Streetley, Staffs.

CRAVEN HYDRO-ELECTRIC SUPPLY CO., LTD.—Cap., £5 000. To carry on business of electric light and power company. Reg. Office: Linton Mills, near Skipton, Yorks. (Public Co.).

SIGNS AND PRODUCTS, LTD.—Cap., £500. Advertising contractors or agents, manufacturers of and dealers in illuminated and other signs, electricians, etc. Office: 45, Bedford Row, London, W.C.1.

A. AND E. DURN AND CO., LTD.—Cap., £1 000. Electrical and general engineers, manufacturers of and dealers in wireless, electrical and general sundries, etc. Permanent managing director and chairman: A. J. Durn, 432, Mawneys Road, Romford.

GREENWOOD AND SONS (MOTORS), LTD.—Cap., £3 000. To acquire business of a motor, electrical and general engineer carried on by S. J. Greenwood at Farley Works, Farley, South Norwood, as "Greenwood and Sons." Solicitors: Tatton, Gaskell and Tatton, 144, Kensington High Street, W.8.

VOCOSOL, LTD.—Cap., £30 000. To acquire, turn to account and trade with certain inventions relating to a system of translating mechanical vibrations into electrical waves, to carry on business of radio, electrical and cinematograph engineers, etc. Solicitor: J. E. M. Crowther, 23, Abingdon Street, Westminster, S.W.1.

ACE ENGINEERING CO., LTD.—Cap., £500. To acquire business of general engineer carried on by J. S. Bayfield at 20, Bucklersbury, London, E.C., as the Ace Engineering Co., and to carry on same and business of motor and electrical engineers, etc. Solicitors: Parsons, Evans and Francis, 5 and 6, Cork Street, Bond Street, London, W.1.

RUSHTON TRACTOR CO. (1929), LTD.—Cap., £200 000. To acquire undertaking of Rushton Tractors, Ltd., and to carry on business of electrical and general engineers and contractors, manufacturers of and dealers in motor and other tractors, omnibuses, etc. Solicitors: Slaughter and May, 18, Austin Friars, London, E.C (Public Co.).

BANDOLUX, LTD.—Cap., £5 000. To adopt agreement with Alois Geisen to manufacture and exploit travelling sign known as "Bandolux," to carry on the business of advertising agents and contractors by signs or by any other means, electricians, dealers in electricity, etc. Solicitors: Woolfe and Woolfe, 13a, Old Burlington Street, London, W.1.

J. W. LONCASTER AND SONS, LTD.—Cap., £5 000. To acquire the business of engineer and shipwright formerly carried on by the late J. W. Loncaster at Madeley Street, Hull, as "J. W. Loncaster and Sons," and to carry on same and business of electrical and general engineers, etc. A director: F. C. Loncaster, 269, Hawthorne Avenue, Hull.

SPEYER SCHWERDT AND CO. (1929), LTD.—Cap., £20 000. To acquire business of general merchants carried on at 5 and 7, Golden Lane, E.C., as Speyer Schwerdt and Co., Ltd., and to carry on the business of manufacturers of and dealers in insulators, etc., telegraphic, telephonic and electrical engineers, etc. Reg. Office: 5 and 7, Golden Lane. London, E.C.2.

ROSE AND PARTRIDGE, LTD.—Cap., £1 000. To acquire business of electrical engineers and dealers in electric novelties and merchants now carried on by A. H. Rose at 6, South Street, London, E.C., as Rose Bros., and the business of electrical engineer and dealer in electric novelties now carried on by S. Partridge at 43a, Barbican, London, E.C., as "S. Partridge," to carry on the business of manufacturers of and dealers in electric batteries, lamps, torches, accumulators, instruments and novelties, wireless installations, loud speakers, etc. Reg. Office: 6, South Street, London, E.C.2.

COMMERCIAL INFORMATION.

County Court Judgments.

[NOTE.—*The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debt. They may be for actions. But the Registry makes no distinction. Judgments are not returned to the Registry if satisfied in the Court books within 21 days.*]

C. A. W. ENGINEERING CO., 41, Parkhouse Street, S.E.5, general electrical engineers. £14 15s. 10d. August 12th.

CURTIS, Mr. J., 247, Stockport Road, Levenshulme, wireless dealer. £20 0s. 10d. July 29th.

DAVENPORT AND CO., 11, King Street West, Manchester, electrical engineers. £21 16s. 10d. July 22nd.

DAVIES BROS., 34, Mill Street, Crewe, wireless agents. £10 5s. 2d. July 17th.

GIFFORD AND GIFFORD, 37, Green Lane, Ilford, radio dealers. £36 2s. 11d. August 7th.

HUSBANDS, Mr. E. C. A., The Old Post Office, Bridgegate, Retford, wireless dealer. £26 3s. 7d. July 16th.

INTERNATIONAL ELECTRICAL CO., LTD., Ashley Road, Tottenham. £26 7s. 11d. July 17th.

NOBLE, J. Hall, 12, High Bridge, Newcastle-on-Tyne, radio engineer. £13 4s. 6d. July 31st.

PARSONS, Ernest M., 57, Paragon Street, Hull, electrical contractor. £25 14s. 10d. August 21st.

SAUNDERS, Cyril Augustus Victor, 87, Cambridge Road, New Malden, electrical accessory factor. £42 14s. 3d. July 18th.

SENIORS WIRELESS STORES, 961, Abbeydale Road, Millhouses, Sheffield, wireless dealers. £20 18s. 3d. July 31st.

SUMMERS, Mr. (trading as SOUTH ESSEX ELECTRICAL CO.), 30, London Road, Romford. £25 10s. 4d. August 2nd.

TUMILTY, Mr. H. G., 55, High Street, Dovercourt, electrical engineer. £19 11s. 6d. July 17th.

VERNON, L. G. W., The Garage Llanymynech, wireless dealer. £20 13s. 7d. July 26th.

Deed of Arrangement.

PARCELL, Ernest, Eastcheap, and Empress Avenue, Letchworth, wireless dealer, electrical and radio engineer. Dated September 11th, filed September 17th. W. A. J. Osborne, 119, Finsbury Pavement, E.C., C.A. Liabilities unsecured, £636; assets, less secured claims, £171.

Receivership.

BAILEY AND INCLEDON, LTD.—E. V. Weller, of 17, Soho Square, W., was appointed receiver and manager on September 14th, 1929, under powers contained in debenture dated November 21st, 1928.

Private Meetings, etc.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

BRITISH ELECTRICAL REPRODUCTION CO., LTD., Lee Valley Road, Ponders End, Middlesex. The creditors were called together on September 18th at the offices of Mr. F. P. Woodcock, solicitor, 5, Holborn, W.C., when a balance sheet was presented as at September 6th last, which showed that the amount due to trade creditors was £2 390, and there were loan creditors for £1 275. There are also debentures and interest amounting to £539, and preferential creditors, salaries, rent, wages, etc., £135. On the assets side the cash at bank was put down at £93; there were sundry debtors, £55; stock estimated at £940; furniture and fittings, £44; and patent rights, £597. There was a debit balance on the profit and loss account of £3,128 and preliminary expenses £35. The authorised capital of the company is £600 in £1 shares, of which 553 shares have been issued. It was stated that the debit balance referred to included research and experimental expenditure. It was reported that on September 5th last the debenture holder appointed a receiver, and that action was taken in the interests of the general body of creditors and the debenture holder intended to defer his claim and was anxious that immediate steps should be taken in order that the company should not go on incurring liabilities. The company was formed in July, 1928, and acquired certain patent rights in connection with sound reproducing instruments. The company first had small premises at Cricklewood, where mostly experimental work was carried on. In May, 1929, arrangements were come to for the company to manufacture radio gramophones for another company, and the Cricklewood premises were then given up and the company carried on at Ponders End. That other company supplied the cash to enable wages to be paid and bought goods for the company. An order was given for a thousand machines, but after materials had been ordered the arrangement was modified so that the machines would be taken when required. The company's business was to fit a radio machine into a gramophone which had been supplied by the other company. One of the directors had also invented a talking film machine, but it could not be developed owing to lack of funds, and it was stated that if it could be developed and sold the creditors would probably get a substantial dividend, if not 20s. in the £. Negotiations had been pending by a syndicate who would form a company and exploit the machine. After some discussion it was decided that the meeting should be adjourned to enable the company to prepare a scheme to submit to the creditors.

SHANNON, William, trading as J. SHANNON AND CO., electrical engineers, New Market Street, Londonderry. The creditors were called together on September 20th at the offices of Colquhon and King, solicitors, Londonderry. A statement of affairs was submitted by J. Howard Wilson and Co., I.A., of Castle Street,

Digitized by Google

Londonderry, showing liabilities of £3 956, of which £1 884 was due to unsecured creditors, and £2 072 to the bank, who claimed £2 722 and held securities consisting of life policies of the surrender value of £650. In addition, a local building society were fully secured creditors for £1 128, holding as security a charge on leasehold premises. There were further secured creditors for £300 in respect of an engine installed under a hire purchase agreement. The assets were estimated to realise £810, from which had to be deducted £187 for preferential claims, leaving net assets of £623, or a deficiency of £3 333. It was stated that the debtor had been in business for a considerable number of years as a finisher to the shirt and collar trade. His brother had for some time carried on an electrical contracting business, and about four years ago he gave it up and the concern was taken over by the debtor. At the time there were liabilities of between £800 and £900. The debtor had since attempted to continue the two businesses, but the electrical contracting one had not been a success. The liabilities and assets of both the businesses were included in the statement of affairs. It was further stated that the shirt and collar section of the business was considerably affected by the coal stoppage, and had also suffered through recent changes in fashion. The turnover in the finishing business was from £400 to £500 a month whilst that of the electrical contracting side had been between £1 500 and £1 700 per annum. During the year to March, 1927, the net profits were £131, and in the following year they fell to £83. The drawings in those two years were £771 and £362 respectively, but these amounts included certain payments to creditors. After some discussion, it was decided to accept an offer of 4s. in the £.

London Gazette, etc.

Winding-up Petition.

ELECTRAMONIC CO., LTD.—A creditor's petition for winding-up has been presented by Celestion, Ltd., Celestion Works, London Road, Kingston-on-Thames, radio manufacturers, and is to be heard at the Royal Courts of Justice, Strand, London, W.C.2, on October 15th.

Bankruptcy Information.

TATTERSALL, John Harold Barlow, 456, Burnley Road, Scout Bottom, Waterfoot, Lancashire, trading as H. TATTERSALL, plumber and electrician. Receiving order September 18th. Debtor's petition.

SAUNDERS, Thomas Alfred, and RIDDALL, William John (trading as TUNBRIDGE WELLS MOTOR RADIATOR CO.), Basinghall Street, Tunbridge Wells, Kent, motor engineers. Receiving order, September 16th. Creditor's petition.

Notice of Intended Dividend.

BROCK, Reginald Lewis, trading as R. L. BROCK AND CO., 5, Bedford Row, Tavistock Road, Plymouth, electrical engineer. Last day for receiving proofs, October 5th. Trustee, J. S. B. Hole, 240, High Holborn, London, W.C.1.

Application for Discharge.

WHEELER, Frederick George, Wynchwood, Broadlands Avenue, Shepperton-on-Thames, Middlesex, electrical engineer. Hearing October 18th, 10.30 a.m., Assize Court, Kingston, Surrey.

Partnership Dissolved.

C. AND P. ELECTRICAL AND PLUG CO. (James COOPER and William Stanley PICKARD), electrical engineers and sparking plug manufacturers, Cottingley Bridge, Bingley, Yorkshire, as from July 24th, 1929, by mutual consent.

HIGGS, J., AND CO. (Joseph Henry HIGGS and William George STEVENS), wireless engineers, 4, Stoney Stanton Road, Coventry, by mutual consent as from August 12th, 1929. Debts received and paid by W. G. Stevens.

MEREDITH AND SIMMS (Ivor Llewellyn MEREDITH and James SIMMS, automobile electrical engineers, Stanley Street, Rotherham, Yorks, by mutual consent as from September 2nd, 1929. Debts received and paid by J. Simms.

Bankruptcy Proceedings.

BRAYSHAW, Durwell, 78, Granby Street, Liverpool, electrician, At his public examination this debtor, whose statement of affairs showed liabilities of £240 and assets of £142, a deficiency of £98, stated that his drawings from his business did not exceed £4 a week. He said he began business on his own account in April of 1927 with £250 savings. Some time after prices began to be "cut" owing to intense competition, and he found himself undertaking contracts at a loss, and at other times unable to obtain work. Asked why other firms could quote less than he could when his own overhead charges were quite small, he replied that they employed boy labour and paid no wages. Debtor admitted that he had not included in his statement of liabilities £60 borrowed from a personal friend, and £97 owing to a moneylender. The examination was closed.

GREEN, William, 3, York Street, Stourport, Worcestershire, wireless dealer, etc. At the first meeting of creditors, held at Kidderminster, the statement of affairs showed liabilities amounting to £91, against assets of £36, less preferential claims of £12, or a deficiency of £67. Debtor attributed his failure to his household expenses exceeding his profits, and to law costs. He stated that early in 1920 he commenced business at his present address as a watch repairer, he then being possessed of tools of trade and a few pounds capital only. In the same year he became entitled to two cottages, household furniture, and a sum of money, representing his interest under his father's will. The cash received was used in the business for the payment of accounts then outstanding and for the purchase of jewellery for sale in his business. His profits then were barely sufficient to meet his necessary expenses, and he was unable to save. In about 1923 he disposed of his two cottages, receiving £80 cash and jewellery to the value of £100. The cash was used to settle accounts then owing and to obtain further supplies for his business. Debtor subsequently introduced to his business that of a wireless dealer, but his takings did not greatly increase, and throughout his profits do not appear to have covered his household expenses. He had been sued on several occasions during the last few years, and judgments have been recorded against him. In May of this year he was taken ill, and for six weeks was unable to attend to his business. After he returned in July several creditors commenced to press for payment of their accounts, and his principal creditors issued a writ, which resulted in an execution being levied on September 3rd, 1929. He then consulted his solicitors, and on their advice filed his petition. The debtor further stated that he had not kept any books of account beyond a record, for a short period, of the repairs executed, and he had never taken any steps to ascertain his financial position or the result of his trading. He admitted that he became aware of his position early in July, 1929, after returning to his business from his illness, but stated that he had contracted two small debts only since that time, as he hoped to pull the business round. The case, being a summary one, was left in the hands of the Official Receiver as trustee of the estate.

WHITTLE, Frank, 41, Mawdsley Street, Bolton, Lancs, electrician. The public examination of this debtor was held on September 17th at the Court House, Mawdsley Street, Bolton, when a statement of affairs was presented showing liabilities of £122, assets estimated to produce £24, and a deficiency of £98. The debtor stated that he had traded since 1912, when he commenced without capital. Prior to September, 1927, the weekly profits had averaged £3, but after that time they fell to about half that amount, due to other similar businesses opening in the town and to the Corporation commencing to do electric light installations on the hire-purchase system. The examination was closed.

WOODHEAD, Titus Ernest, 26, Central Drive, Blackpool, electrical factor. This debtor has attributed his failure to extravagance in living, betting losses, keen trade competition in Blackpool and some bad debts. At his public examination last week he was questioned about his betting losses, and he stated that he lost about £40 at two meetings. The Official Receiver asked for an order for a statement to be made of the race meetings that debtor had attended, and the money he actually won and lost. Debtor was ordered to produce the statement of his betting account within 28 days and the examination was then adjourned.

METAL AND CHEMICAL PRICES.

*** The metal prices are supplied by British Insulated Cables Ltd., and the rubber prices by W. T. Henley's Telegraph Works Co., Ltd.

THE LEAD MARKET.

The market has, according to James Forster and Co., been dull and uninteresting with minor fluctuations. The recent arrivals having been absorbed by consumers, the contango has once more disappeared and been replaced by a small backwardation, while prompt supplies are again rather short. The American price remains unchanged at 6·90 cents.

Closing prices on September 20th were £23 11s. 3d. for September, £23 8s. 9d. for October, and £23 10s. for November and December, 2s. 6d. up to 2s. 6d. lower on the week.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patents Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

315 563 STERLING TELEPHONE AND ELECTRIC CO., LTD., N. BLADES, and J. R. BEARD. Relays and like components of telephone apparatus. (4/7/28.)
293 395 BRITISH THOMSON-HOUSTON CO., LTD. Electric immersion heaters, particularly for type-metal pots. (5/7/27.)

THE street lighting demonstration stand of the General Electric Co., Ltd., at the recent Public Lighting Engineers' Conference at Bournemouth Town Hall.

298 975 ELECTRICAL RESEARCH PRODUCTS, INC. Constant-frequency wave source (18/10/27.)
294 108 H. J. KÖCHENMEISTER. Selenium and like cells. (16/7/27.)
294 574 BRITISH THOMSON-HOUSTON CO., LTD. Electric control systems. (26/7/27.)
315 570 SOC. ITALIANA PIRELLI and L. EMANUELI. Multicore oil-filled high-tension electric cables. (17/7/28.)
315 571 H. DEAN and CHLORIDE ELECTRICAL STORAGE CO., LTD. Electric accumulators. (17/7/28.)
315 578 BRITISH THOMSON-HOUSTON CO., LTD., and L. B. AULT. Diaphragms for acoustic devices. (23/7/28.)
301 886 ELECTROACUSTIC GES. Subaqueous sound apparatus. (8/12/27.)
313 553 O. SCHNEIDER. Positive electrode for electrical accumulators, more particularly for use in miners' lamps. (14/6/28.)
315 583 W. GEIPEL, LTD., and K. S. GEIPEL. Electric switches. (27/7/28.)
315 596 E. ASCH and IDEAL WERKE AKT.-GES. FÜR DRAHTLOSE TELEPHONIE. Electric sound-boxes or pick-ups for talking machines. (13/8/28.)
304 748 SIEMENS-SCHUCKERTWERKE AKT.-GES. Electrodes for contact rectifiers. (27/1/28.)
315 598 GENERAL ELECTRIC CO., LTD., and N. R. CAMPBELL. Photo-electric cell systems. (16/8/28.)
315 613 A. E. SHORT and H. O. SHORT. Electric wiring applicable to metal vehicle construction. (31/8/28.)
297 038 ALLGEMEINE ELEKTRICITÄTS GES. Apparatus for transmitting railway signals to a moving train. (12/9/27.)
315 621 ELECTRO-MECHANICAL BRAKE CO., LTD., and J. H. WILLIAMSON. Trucks for tramway and railway rolling stock. (14/9/28)
297 389 TELEFONAKTIEBOLAGET L. M. ERICSSON. Telephone call bells. (20/9/27.)
315 623 GENERAL ELECTRIC CO., LTD., and E. L. RANDALL. Supports for electric lamps. (19/9/28.)
298 642 FABRIK ELEKTR. APPARATE F. SAUTER AKT.-GES. Motor operated electric switch and valve apparatus. (13/10/27.)
298 905 BRITISH THOMSON-HOUSTON CO., LTD. Apparatus for generating mercury vapour or other vapour having a low heat-conducting characteristic. (14/10/27.)
315 638 R. P. A. ANDERSON. Multiple filament electric incandescent lamps. (16/10/28.)
299 318 ASSOCIATED ELECTRICAL INDUSTRIES, LTD. Systems for automatically paralleling alternating current circuits. (20/10/27.)
306 523 P. ALGRAIN. Rolling stock of railways, tramways, or road transport. (23/2/28.)
299 895 ALLGEMEINE ELEKTRICITÄTS-GES. Device for transmitting signals from the railway track to a moving train. (4/11/27.)
301 902 SIEMENS-SCHUCKERTWERKE AKT.-GES. Gas-proof housing for electrical apparatus. (8/12/27.)
304 324 BRITISH THOMSON-HOUSTON CO., LTD. Systems of electric distribution. (19/1/28.)
283 971 ERICSSON-FATME and A. ROSA. Electric circuits for central telephone offices. (20/1/28.)
315 674 J. FIDDES. Registering and/or recording devices for electromotors. (16/2/28.)
315 893 S. G. S. DICKER (N.V. 'PHILIPS'S GLOEILAMPENFABRIEKEN). Transformer cores and the methods of assembling such cores. (20/2/28.)
302 140 SIEMENS UND HALSKE AKT.-GES. Circuit arrangement for telephone installations with semi-automatic working. (10/12/27.)
299 298 J. Q. MACDONALD and W. M. SCOTT. Electroplating. (22/10/27.)
315 775 R. MAWBY and A. C. HOLT (trading as HOMA ENGINEERING CO.). Electric light and like switches. (10/4/28.)
315 679 G. L. PORTER and FERRANTI, LTD. Electric relay devices. (12/4/28.)
315 735 AUTOMATIC TELEPHONE MANUFACTURING CO., LTD., W. O. PASSMORE and R. TAYLOR. Telephone systems. (16/4/28.)
315 685 N. C. F. JENSEN. Electric igniters for cigarettes and the like. (16/4/28.)
292 530 ELECTRICAL RESEARCH PRODUCTS, INC. Regulators for controlling the speed of electric motors. (21/6/27.)
315 739 V. HOPE. Contacts for electric fuses, switches and the like. (17/4/28.)
315 744 A. REYROLLE AND CO., LTD., and J. A. HARLE. Apparatus for energising potential circuits in accordance with the voltage on the high tension side of a power transformer. (17/4/28.)
291 084 SIEMENS-SCHUCKERTWERKE AKT.-GES. Junction and fuse boxes for multicore cables. (28/5/27.)
315 817 J. LUCAS, LTD., and O. LUCAS. Motor vehicle electric head lights. (19/4/28.)
315 907 J. NEALE. Construction of selenium bridges or cells. (20/4/28.)
315 908 SIR C. A. PARSONS and J. ROSEN. Brush gear for dynamo-electric machines. (20/4/28.)
289 381 SIEMENS UND HALSKE AKT.-GES. Gas-filled discharge vessels, more particularly for use as rectifiers. (25/4/27.)
289 065 ASSOCIATED TELEPHONE AND TELEGRAPH CO. Telephone systems. (22/4/27.)
289 773 ASSOCIATED TELEPHONE AND TELEGRAPH CO. Switches for use in telephone or like systems. (30/4/27.)
298 216 C. A. CAMBAY. Coin-freed telephone apparatus. (6/10/27.)
291 758 SIEMENS-SCHUCKERTWERKE AKT.-GES. Means for transmitting mechanical movements to the interior of vacuum vessels. (8/6/27.)
315 926 PARK ROYAL ENGINEERING CO., LTD., and HOLDER, J. E. D. Electric relays. (30/4/28.)
295 702 BRITISH THOMSON-HOUSTON, CO., LTD. Electrons discharge devices. (19/8/27.)
315 937 J. P. ANNACKER. Watertight electrical switch and fuse cases. (9/5/28.)
297 670 LANDIS AND GYR SOC. ANON. Adjusting device for the driving system of induction measuring instruments. (24/9/27.)
315 938 A. H. MACKLEY and L. W. SLADE. Electric lighting systems. (9/5/28.)
315 940 J. F. GILL, J. N. CHAVIARA and F. J. TEAGO. Commutation of electric currents. (10/5/28.)

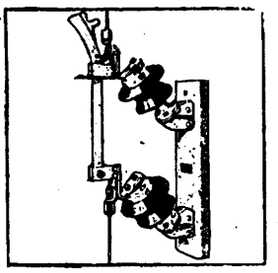
Rural Electrification

'ELECTRIC CONTROL' specialize in switch gear and fuses which are especially suitable for Rural Electrification schemes.

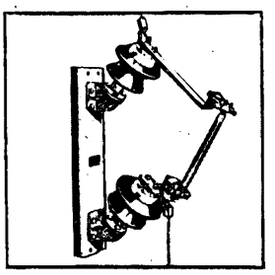
The top photograph shows a vertical disconnecting switch for disconnecting a section of overhead line from an underground cable or from a transformer situated at the foot of a pole or structure. This switch has many special features and has been designed expressly as a vertical switch, thus avoiding the reduction in flash-over value which is inevitable in the adaptation of a horizontal switch to vertical mounting.

Full particulars of these and other 'Electric Control' products will be sent upon application.



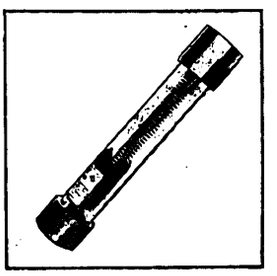
ISOLATING SWITCHES

Made in the horizontal inverted type, the horizontal upright type and the vertical type illustrated.



FUSE MOUNTS.

Robust construction, incorporating typical 'Electrical Control' practice.



FUSES

These fuses are backed by a thirteen years' reputation and carry a three-year free service.

ELECTRIC CONTROL

LIMITED, BRIGHTON.

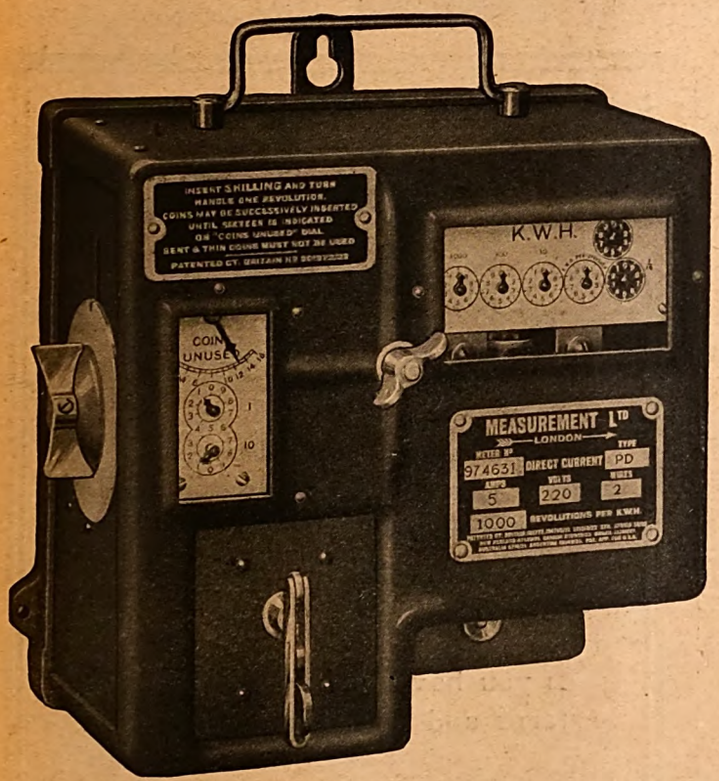
THE ELECTRICIAN

Vol. CIII.—No. 2679. Friday, October 4, 1929. [Registered at the General Post Office.] Sixpence

Your Guardian against Bad Debts, Inaccuracies and Irregularities



THE outstanding advantages and sound British Construction of "Measurement" Meters are an insurance against unreliability and inaccuracy: special attention has been paid to immunity against fraud.

Write for particulars of our A.C. and D.C. prepayment Meters.

OUTSTANDING FEATURES.

i. The coin box is independent of the meter cover.

ii. Price change wheels can be fitted in situ in one minute.

iii. The operation of mechanism is independent of gravity, etc.

iv. The meters are small in bulk and light in weight, the A.C. prepayment meter weighing only 14½ lbs. and the D.C. prepayment meter 19 lbs.

PRICES ARE COMPETITIVE.

Current Topics.

Unfair Propaganda.

In considering the opposition which is being worked up against the Central Electricity Board's grid scheme in South-Eastern England, we can at least appreciate the motives—though we hold them mistaken—of those conservative Britons who object, on principle, to any sort of progress, no matter how beneficial it may be to their fellow countrymen. Living with their heads in the clouds, they picture England as a veritable Arcadia, and resolutely shut their eyes to the fact that the greatness of this country is founded on its capacity to produce and sell goods to the rest of the world. People in this category are entitled to their opinions, even though they show how illogical they are by their unprotesting acceptance of stucco villas, telegraph poles, petrol pumps, hoardings and other signs of a commercial age.

But the motives of the most vociferous of the opponents of this very necessary electrical development are not so disinterested, and their methods of conducting their propaganda are definitely unfair and misleading. We refer of course to the series of photographs of the Sussex Downs which appeared last Friday in a prominent daily paper. These pictures had superimposed upon them some grossly exaggerated drawings of overhead lines which were designed to show the disastrous effect they would have on the charm of the Downs. One picture showed a line of towers stretching some two miles into distant hills, in which not only every tower but practically every conductor was clearly visible throughout its entire length. As a representation of the Forth Bridge it would have passed unnoticed, but as a transmission line it was obviously impossible. Attempts to arrive at the proportions of these supposititious structures gave each of the conductors a diameter of approximately 1 ft. 3 in., instead of an actual ¾ in., and in some cases the thickness of the individual conductors was practically identical with that of the members of the supporting structures, which also showed signs of considerable distortion and exaggeration.

The most effective picture showed a tower dumped down right in the village of Offham, but much of its effectiveness was naturally discounted by the fact that local representations, made before the inquiry, resulted in the abandonment of this particular site.

While the misleading nature of these illustrations was immediately and unmistakeably evident to electrical engineers, the layman would quite naturally accept them at their face value, and nobody with any regard for the amenities of the countryside could have been blamed for being persuaded by such startling evidence to lend his support to the opposition. Fortunately, the newspaper concerned has since reproduced an actual untouched photograph of part of a 132 kV line already erected in Scotland which shows how unobtrusive these lines are, and which should have allayed any reasonable fears aroused by the earlier pictures. The organised opposition, however, is manifestly unwilling to accept this evidence, and though it inferentially admits the inoffensiveness of the portion of the Scottish line shown in the photograph, falls back on the quibble that the line runs at the foot of a low range of hills, and so does not interfere with the skyline.

The Sussex Downs controversy is of direct interest to all electrical engineers concerned with overhead construction, and if allowed to proceed unchecked, may gravely affect future progress of electricity supply in this country. We, therefore, hope that members of the electrical industry, both individually and collectively, will take every possible opportunity to correct the prevailing misconceptions, and indicate the consequences which would inevitably attend an obstructionist victory.

The Electric Homes Campaign.

To give a send-off to the E.D.A. Electric Homes Campaign a series of conferences was held last week in London, Birmingham, Leeds, Manchester, Newcastle, Glasgow, Edinburgh, Cardiff and Bristol. Attendances at these meetings were generally most satisfactory, and excellent discussions followed the addresses given by Col. W. A. Vignoles and Mr. V. W. Dale on the objects and methods of the campaign. Particular emphasis was laid on the need—frequently stressed in these columns—for establishing new E.D.A. Electric Circles and reviving those Circles which have become inoperative. There was universal recognition that in the new campaign the Association had provided the industry in general, and the E.D.A. Circles in particular, with sufficient co-operative publicity work to engage their active attention for a long time to come. It is confidently anticipated at headquarters that the immediate result of these conferences will be seen in a general revival of E.D.A. Electric Circle activities. In this connection we are asked to state that supply engineers and others proposing to convene meetings for that purpose

Digitized by Google

are cordially invited to notify their Area Officer, or the Director at 15, Savoy Street, where, if possible, arrangements will be made for the Area Officer or another E.D.A. Officer to be in attendance at inaugural meetings.

The E.D.A. Conferences.

READERS will find on another page the syllabus for the 1929–30 session of the London E.D.A. Conferences, and will note with interest that at least two out of the four subjects already chosen are directly concerned with selling, while the other two may well be treated from the sales point of view. In emphasising, as we have done frequently during the past few seasons, the need for concentration on selling, we do not overlook the fact that the title of these conferences has been modified by the omission of the word "salesmanship," though why this has been done we are at a loss to discover. There are to-day so many opportunities for electrical men and women to hear the reading of papers on technical subjects and to take part in discussions on these matters. The old E.D.A. Salesmanship Conferences were the one place where one could expect to learn about some of the intricacies of the selling art. Selling is a sphere of activity in which the electrical industry has much to learn. The fact should be recognised, and the E.D.A. Conferences should be made the headquarters for the dissemination of information on the many problems involved. The E.D.A. has provided adequate facilities for sales talks this winter, and it only remains for the speakers at the meetings to remember that reminiscences of the early days of the industry, and involved theoretical descriptions of the design and operation of apparatus, are definitely out of place at an E.D.A. Conference. The future progress of the entire electrical industry directly depends on our attitude to salesmanship. At present we most of us lack a definite sales policy for the domestic market, and though development is certainly proceeding, there is little doubt that it is more due to the growing desire of the public to have certain kinds of electrical apparatus than to the operation of an orderly electrical sales plan.

The Radio Exhibition.

THE Radio Exhibition which closed at Olympia, London, yesterday, has been one of the most successful wireless exhibitions so far held in this country, and from all branches of the industry good business is reported. Attendances have been good, and, in most cases, the daily totals of last year have been easily exceeded, many days recording figures around 20 000. The public interest this year was chiefly centred in the large radio-gramophone equipments which seem to be slowly taking the place of the individual gramophone. These big sets are chiefly of the "all-mains" type, and represent a considerable advance on last year's designs of a similar equipment. The convenience of the "portable" set has long been admitted, and the receiver has been made still more attractive by including in many of this year's models facilities for "all-mains" drive. The operation of loud speakers throughout the exhibition by means of a common supply of music gave to this year's show an atmosphere of liveliness that was sadly missing on earlier occasions. The provision of demonstration rooms was another improvement which the R.M.A. would be wise to extend next year, for, apart from the personal contact with the public which the rooms allowed, in circumstances more attractive than those obtaining on the stands, salesmanship in its most intensive form was made possible by permitting the prospective purchaser to concentrate on the goods offered, without the interruption of passers-by, the noise of the general exhibition and other distractions. The exhibition this year, including over 290 stands, taxed the space of the New Hall to such an extent that we would urge upon the R.M.A. the necessity for making the next show larger, both in overall and in stand area. For example, the stands this year, even the biggest of them, were so small as to give the impression that one was at a local traders' exhibition instead of the biggest annual show of the whole radio industry. There was about the exhibition an appearance of economy which conveyed the impression that the radio industry, though not prosperous was doing its best, and, though for all we know this may be the state of the industry, such an impression is far from desirable at an exhibition.

Radio Television.

A CEREMONY which may perhaps prove to be historical in the progress of television took place on Monday, when the first official tests of radio television were made through 2LO. For the time being similar tests will be made each day between 11.0 and 11.30 a.m., in order that the Baird Television Development Co. may improve and develop this system of transmission. The service is of a purely experimental nature, and at the moment is confined to one wavelength, so that speech and vision cannot be transmitted simultaneously; in the circumstances it is necessary for the speaker to speak first and then change over to television. On the completion of the Brookman's Park station two wavelengths will be allocated, when both television and speech will be transmitted simultaneously in much the same way as was done at the test before the Postmaster-General last March. On that occasion the standby station at Marconi House was used in conjunction with 2LO. For the transmission on Monday, televisors were installed at Savoy Hill, the G.P.O., Boxhill and elsewhere, though no receivers for public use will be available until the experimental period is passed and a satisfactory service can be guaranteed. The studio from which the artists are "televisied" is at the offices of the Baird Company, in London. From there the image is passed over land lines to Savoy Hill, where there is a check receiver, and then over the usual land lines to the transmitter at Oxford Street. The received images on the occasion of Monday's transmission were slightly less clear than those when we last saw television demonstrated over land lines, but since this was the first radio transmission, and neither the Baird Co. nor the B.B.C. had previous knowledge of the amount of distortion which might be introduced over the land lines and other circuits, such errors may be corrected.

British Trade in Argentina.

NO firm wishing to increase its business overseas can afford to overlook the markets of South America, and especially that of Argentina. That the present time is opportune for development of British trade in these Republics is clearly recognised by the appointment of the D'Abernon Mission, and also by the proposed British Empire Trade Exhibition. This project, which was initiated by the British Chamber of Commerce in Argentina, and which has already gained many influential supporters, including Sir CHARLES PARSONS and Mr. VICTOR WALLINGTON, chairman of the B.E.A.M.A., is to be held in Buenos Aires from February 18th to April 2nd, 1931. It should go far towards placing British trade with Argentina more on a par with British purchases and investments there, and if it is wholeheartedly backed by British manufacturers it should demonstrate, not only to Argentina, but also to all South America, that British initiative, British goods and British salesmanship, backed by British credit, are not declining but are preparing to reach higher levels.

Facilities for Visitors.

TAKING advantage of the facilities offered when THE ELECTRICIAN offices were moved to Bouverie House, many of our subscribers from the Provinces and from overseas make free use of our spacious and comfortably appointed reception hall whenever they happen to be in London. Several recent overseas visitors who have called on us had not heard that what is practically the accommodation of a London office was freely at their disposal, and, for the benefit of others who are unaware of this service, we repeat the invitation to use the accommodation specially provided for ELECTRICIAN subscribers.

THE NEW I.E.E. PRESIDENT.

The Career of Sir T. F. Purves—Noteworthy Wartime Work on Special Types of Communication Apparatus—Extending the Employment of Long Distance Telephony—Important International Work.

COL. SIR THOMAS FORTUNE PURVES, who assumed office as President of the Institution of Electrical Engineers on Tuesday, has spent the whole of the forty years of his engineering career in the Post Office, of which he is now engineer-in-chief.

Born at Blackadder Mount, Berwickshire, on December 31st, 1871, and educated at Greenlaw and Duns Academy, he first joined the Post Office in 1889 as a telegraphist at Edinburgh. While there, he studied at the Heriot Watt College and at Edinburgh University to such purpose that, in 1892, he won the first medal of the Heriot Watt College in electricity and telegraphy, an achievement which led to his selection for transfer to a position in the Post Office Engineering Department in Edinburgh.

A departmental examination two years later brought further advancement, with the appointment of mechanical and electrical draughtsman in the Engineer-in-Chief's office in London, where further steps in the ladder of progress were rapidly negotiated.

Success in a further examination led to his appointment in 1900 as technical officer on the headquarters staff of the engineer-in-chief, and a further change in 1905 to the assistant superintending engineer-ship of the London district. A year later, a similar position in the Southern district—at that time staffed by "K" Company of the Royal Engineers, and including all country south of the Thames and Severn—claimed his services for twelve months, after which he reappeared at headquarters as staff engineer in charge of the designs section of the Engineering Department, a position which placed him in control of the technical development and of the supply of all classes of plant and apparatus required for the telegraph and telephone services.

THE NEW I.E.E. PRESIDENT.

A recent photographic study of Col. Sir Thomas Fortune Purves, who, on Tuesday, became President of the Institution of Electrical Engineers. As will be seen from the accompanying biographical notes, he has had a long and distinguished career in the Post Office, of which he has been engineer-in-chief since 1922.

On the outbreak of the war he directed his energies to the development of special types of communication apparatus suitable for trench warfare, and so noteworthy was his work in this direction that he was asked by the Director of Signals in France to investigate conditions at the front. This visit was so appreciated that the offer was made of a commission as major in the Royal Engineers, in order that he might continue his work, and also act as a liaison officer between the Army Signal services and the production side of the Post Office. During the war period he was constantly crossing between England and France, visiting every part of the British front, studying and discussing the constantly increasing needs of the Army Signal Service.

As the result of his observations in France, he was able to design a noteworthy series of new types of electrical signalling and detecting apparatus for the various military requirements. He was also responsible for the manufacture and supply of this apparatus. On the termination of hostilities his services were rewarded by the decoration of the Order of the British Empire and the appointment of Hon. Colonel of the 44th (London Home Counties) Division of the Royal Corps of Signals.

When the position of assistant engineer-in-chief was vacated by Sir William Noble in June, 1919, Col. Purves was given the appointment, and on Sir William's retirement from the post of engineer-in-chief Col. Purves again succeeded him. That such a position is an arduous one may well be imagined when it is remembered that, among other responsibilities, it involves the supervision of many different types of electrical engineering plant valued at well over £100 000 000, the responsibility of an annual expenditure of over £15 000 000 on new construction and maintenance, and also the control of a technical staff numbering over 30 000 men distributed throughout the country.

In the seven years during which Col. Purves has been engineer-in-chief, important developments have been made in the Post Office system of electrical communication, notably in the provision of a complete network of underground trunk telephone cables linking all the important towns of Great Britain.

Equally noteworthy has been the rapid extension of telephonic communication between Great Britain and the other European countries, and the provision of public radio telephone services between Great Britain and the U.S.A., and the extension of these radio links to the national telephone systems of most of the European countries, and to practically the whole of the American Continent. Other notable achievements have included the establishment of the Imperial radio-telegraph services to Canada, South Africa, Australia and India, the design and introduction of an automatic telephone system for London, and the rapid extension of automatic telephony throughout Great Britain.

Apart from his official activities, Col. Purves has rendered valuable services to Great Britain as a member of many important international conferences and special delegations.

It was largely due to him that the International Government Committee on long-distance telephony in Europe was inaugurated, and he has continuously presided over the conferences of that section of the committee which is concerned with the technical and engineering aspects of the subject.

Col. Purves's connection with the Institution of Electrical Engineers dates from 1902, when he became an associate. He was awarded the Fahie Premium, and in 1909 joined the ranks of the associate members, becoming full member in 1912, member of Council in 1923, and Vice-President in 1926.

LIGHTING GENERATING PLANTS AND SUB-STATIONS.

The Choice of Fittings for Power Station Illumination—Formula for Turbine Hall Units—Methods of Lighting Outdoor Equipment.

By DAVIS H. TUCK, M.A.I.E.E.

MUCH attention has rightly been paid to domestic and industrial lighting, but the problem is rarely considered in relation to power stations, with the result that the lighting of some central stations is the reverse of scientific.

Turbine halls in generating stations usually have overhead cranes above which the lighting equipment must be suspended.

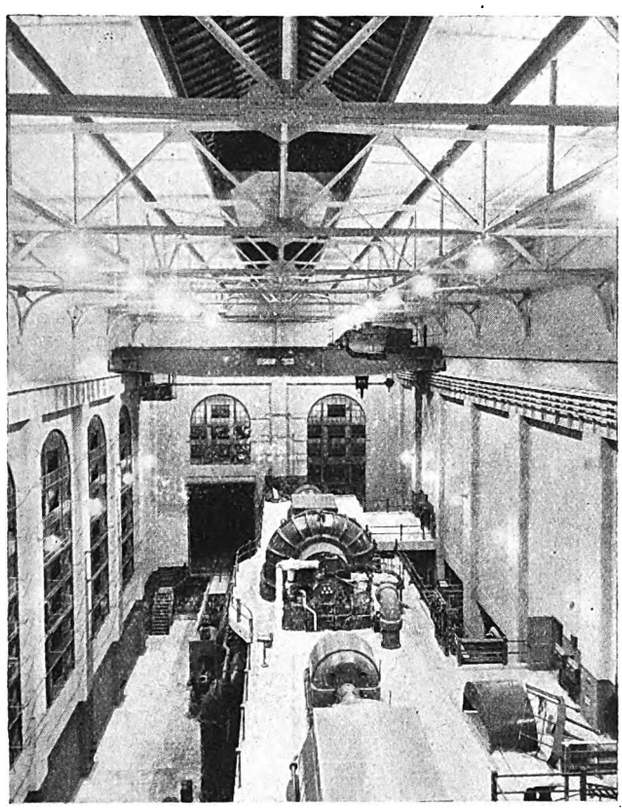

Fig. 1.—Lighting of the turbine hall of the Long Beach Station.

It is therefore necessary for the reflectors to be located at heights of 30 to 60 ft. above the floor. Open condenser wells further increase this distance between the work and the lighting unit. High intensity illumination (15 ft.-candles) is required for the turbine installation work and for repair work. A lower intensity of illumination (approximately 7½ ft.-candles) is required for operating conditions.

Inasmuch as the intensity of illumination varies inversely as the square of the distance from the light source, and directly as the cosine cubed of the angle of incidence, it follows that, for a reflector to be effective in producing illumination from great heights above the floor, the candlepower in the downward directions must be increased, and as great a percentage of the available flux of light from the lamp must be concentrated at angles of incidence whose cosine cubed values are near 1·0.

A reflector to meet these specifications has been developed, an example of which is seen in the lighting unit for suspending over the crane in a turbine hall, illustrated in Fig. 1. With this unit the candlepower of the bare lamp is increased approximately 13 times, and 43 per cent. of the available light flux is concentrated in the 0·30 deg. zone.

In some cases the turbine hall is designed to be a showplace with a visitors' balcony, where interested parties may inspect the machinery. In such stations the walls and steel trusses are often given a decorative treatment. The lighting unit shown in Fig. 3 may then be made decorative to suit the interior.

Fig. 1 shows the turbine hall of the Southern California Edison Co., Long Beach Station, Los Angeles, Cal., U.S.A., illuminated with the lighting units shown in Fig. 3.

For purposes of illumination calculations, the following formula should be used for the turbine hall lighting unit:

$$\text{Foot-candles} = \frac{340 - \text{mounting height in ft.}}{30} + \text{Watts per sq. ft. of floor area.}$$

Outdoor Sub-stations.

In the past, outdoor sub-stations have been lighted by two radically different methods. The first method is the general overhead type of lighting such as is employed extensively for the interior illumination of industrial plants. The second method employs the use of flood-lights focused on the most important parts of the structure. Both of these methods have decided drawbacks.

The general overhead method of illumination is used to light up apparatus in the structure, and the operator must look into the light to see the apparatus. The decrease in the ability to see when a light source against a black background is in the direct line of vision is too well known to comment upon. In short, the overhead method of lighting is incorrectly applied in the case of the outdoor sub-station. Not only is this method of lighting wrong from the illumination standpoint, but from a mechanical standpoint it is difficult and dangerous to maintain the lighting units when they are hung high above the ground close to the high tension parts.

In an effort to eliminate the glare and the danger attendant to maintenance, the flood-lighting system has been tried for illuminating sub-stations. This system of illumination is expensive, produces dense shadows, and does not eliminate glare. Past practice shows that while overhead lighting has the advantage of low cost, it has the disadvantages of glare, difficult and dangerous maintenance, and is deficient in vertical illumination and deficient in horizontal illumination on the

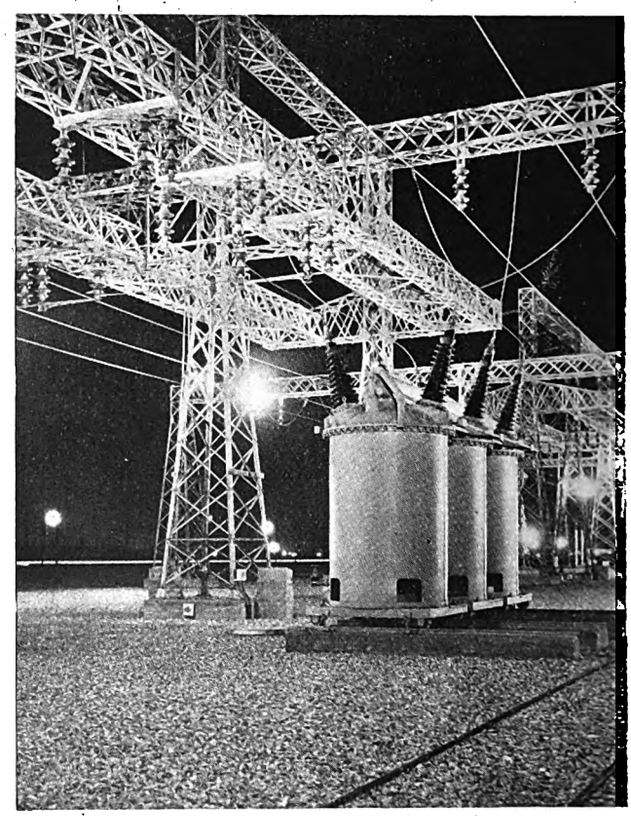

Fig. 2.—Showing even illumination produced by the special fittings for outdoor sub-station lighting.

underside of the apparatus. Flood-lighting, again, though easy to relamp, suffers from the disadvantages of rapid permanent depreciation; glare; and sharp shadows.

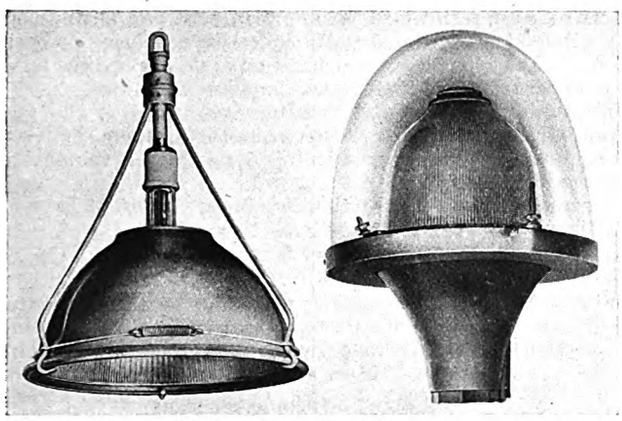
In order to combine the advantages of both the overhead and flood systems, and to eliminate the disadvantages of

Digitized by Google

both in a new system of illuminating outdoor sub-stations, a list of the desirable qualities was drawn up in the relative order of their importance as follows :—

(1).—High vertical component of light.
(2).—High horizontal component of light on under-sides of surfaces.
(3).—Absence of glare.
(4).—Accessibility for relamping.
(5).—Absence of sharp shadows and dark pockets.
(6).—Adequate ground illumination.
(7).—Low permanent depreciation.
(8).—Low initial and maintenance cost.
(9).—Flexible light distribution to suit various conditions of station design.

Fig. 4 shows the lighting unit that has been designed to



Figs. 3 and 4.—The lighting units developed for use in power stations and at outdoor sub-stations respectively.

incorporate the above listed desiderata. The unit is made up of an aluminium alloy housing supporting an adjustable socket, a two-piece refractor and an outer enclosing globe. The socket is adjustable from the outside of the fixture so that the relative position of the lamp filament and refractor can be changed, which in turn varies the vertical angle of maximum candlepower from 10 to 20 deg. above the horizontal. The outer globe is employed to protect the hot refractor globe from the rain.

The units are mounted on brackets or posts at a height of approximately 8 ft. from the ground, and the light is directed up into the structure so that the operator looks along with the light instead of into the light. The exact mounting height above the ground is found by drawing a line from the part to be illuminated to the lighting unit. The height of the unit should be such that the angle formed by this line and the axis of the unit should be between 70 and 80.

Fig. 2 is reproduced from a photo showing how the outdoor sub-station lighting units shown in Fig. 4 illuminate both the under-sides, vertical sides and ground of the sub-station. The picture was taken at the sub-station of the Bureau of Power and Light, Los Angeles, Cal., U.S.A.

INCREASED GENERATING CAPACITY.

Growth of Power Plants in the U.S.A.

DURING the first seven months of 1929 the electric light and power industry of the U.S.A. added 1 150 000 kW to the capacity of its generating plants, according to a statement issued by the Statistical Research Department of the National Electric Light Association.

Of this total increase, 991 000 kW, or 86%, were in steam turbines, 142 000 kW, or 12½%, were in water wheels, and 17 000 kW, or 1½%, were in internal combustion engines. At the present rate of construction, approximately 2 000 000 kW of new electrical generating machinery will go into service during the present year, or substantially the same amount as was added in 1928.

A very marked decrease is noted in the capacity of new waterpower plants constructed this year. The total will probably not exceed 250 000 kW as compared with a figure of 619 000 kW installed during 1928. The bulk of the new construction is in steam generating stations, the first units of two very large new plants having been put into operation this summer. One of these—the State Line plant near Chicago—contains the largest individual turbo-generator so far put into service. This one unit of 208 000 kW accounts for nearly 20% of the year's increase in power plant capacity.

COOLING WATER.

Sterilisation Developments and British Power Station Practice.

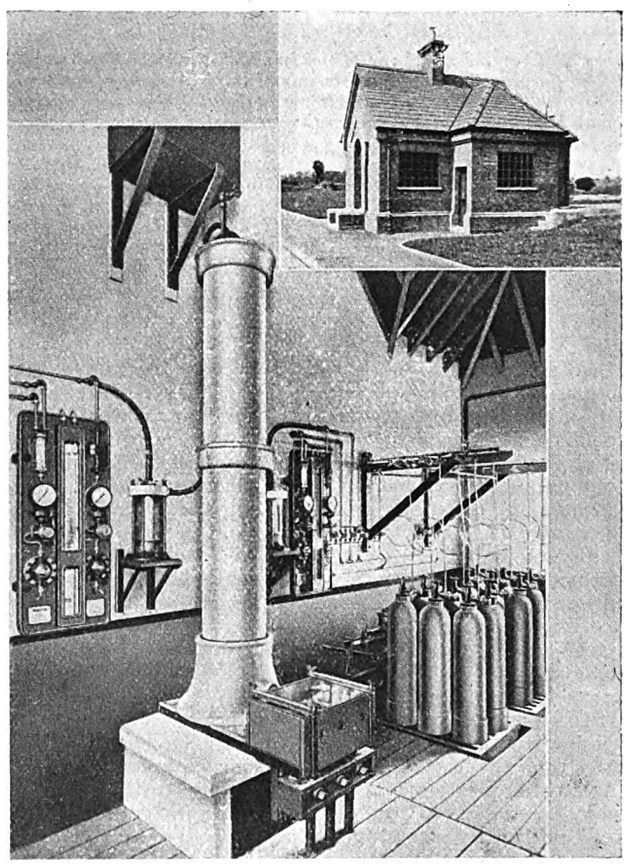
RAPID progress is now being made with the use in power stations of apparatus for sterilising the cooling water with a view to preventing all organic growths on the inside of the condenser tubes and allowing the highest vacuum in the turbines to be maintained continuously.

Generally about one part of chlorine per 2 000 000 parts of water is used for the purpose—that is a mere trace—which is accurately measured without difficulty, and the importance of the matter will be obvious when it is remembered that more or less organic growths take place with all cooling water, and that roughly 0·25 in. drop in the vacuum means an increase of 1% in the steam consumption.

Apart from this, however, there is the further important advantage that the troublesome and costly continual cleaning of the condensers and other plant is eliminated, so that a substantial net economy is obtained. Many sterilising installations are at work dealing with cooling water for power stations up to 100 000 000 gallons per 24 hours, although any amount could easily be treated.

In this connection it is interesting to note that an enlarged edition of the book, " Water Sterilisation by Gaseous Chlorine," has been issued by the Paterson Engineering Co., Ltd., in which is given a comprehensive description, with numerous illustrations and diagrams, of the whole principle of the use of chlorine gas for the sterilisation of cooling water for steam engines and turbines, town's water, swimming baths, sewage and sewage effluents, and many other applications.

The chief value of the use of 100% chlorine gas is that the latter is absolutely stable under all conditions of temperature, allowing of accurate regulation in a manner which is impossible



A typical installation of Chloronomes and (inset) the building in which it is housed.

with bleaching powder or sodium hypochlorite, quite apart from the question of convenience and simplicity. The supply valve on the " Chloronome " panel is merely adjusted to the desired amount, and then the whole arrangement proceeds automatically. A special device is included whereby the chlorine gas is first of all dissolved in a small portion of the water, and this resulting dilute solution then enters the bulk of the water, thus immediately ensuring uniform distribution.

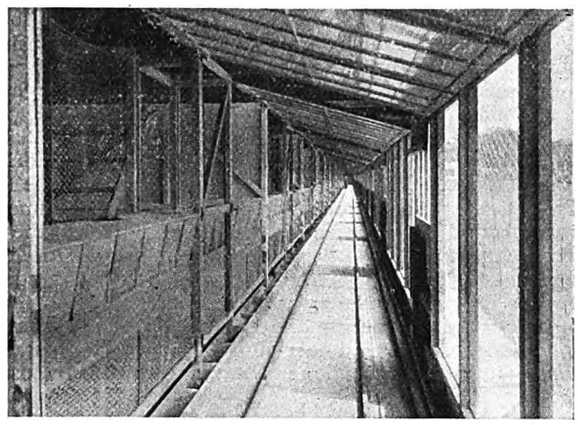
RURAL ELECTRIFICATION.

Value of Analytical Survey of Farm Equipment Market—Selling the Chief Problem—Preliminary Data Required for Sound Development—Calculating the Farmer's Purchasing Power.

By "AGELEC."

THE experience of supply authorities who are in a position to develop electrification in rural areas clearly shows that this new field calls for specialised attention, with specialists to handle it, and also that, though the problems fall under two headings—(1) rural service development; (2) the actual selling of farm electrical equipment—the last-named is the most difficult of solution.

Special interest therefore attaches to an analysis of the electric farm equipment market which was undertaken by a special committee of the National Electric Light Association, New York, the results of which are given in the Association's serial publication No. 289–92.



ELECTRIC POULTRY FARMING.

ONE of the rural industries in which electricity is already playing a useful part in this country is in the operation of poultry farms. This picture, taken at a modern farm at Dunsfold, Surrey, shows the interior of the main laying house, which is 480 ft. long and houses 3 000 birds. Egg production is stimulated by electric lighting. An electric railway runs along the lines shown in the picture, and is used for egg collection, food distribution and for transferring birds from house to house.

Dealing with the selling side the report recommends that the man chosen to make contact with the farmers should have sales ability beyond that of the ordinary salesman. He should be familiar with the company's rules, wiring policies and requirements, and he should understand the fundamentals of the public utility business, for the farmer is surely going to ask him many questions about the company. He should have a general understanding of farming and be able intelligently to discuss improved farm methods. He should be well informed on the practical uses of electricity on the farm, and he should keep up-to-date on this subject by reading the great mass of material that is available. He should remember that he is talking about a new kind of power to a group of people who are not familiar with it, and he should exercise a great deal of patience and diplomacy.

It is appreciated that these are the specifications for a rather high-grade man, but it is believed that such a man is necessary at this time in the selling of farm electric equipment.

As to the question: how many of these rural service men should be employed? the committee recommends that there should be at least one such man for every 500 farm customers. A larger number than this is necessary in the beginning of an intensive rural electrical development programme. It is recommended that eventually there should be such a man in each district office where the company does business in rural territory.

Necessary Information.

Intelligent merchandising of electrically-operated equipment in rural areas involves specific and detailed knowledge regarding types of agriculture, financial resources of the farmer, natural purchasing seasons and buying habits of the prospective customers. Fortunately, there is a large amount of statistical information available which, when digested, analysed and summarised, will yield important information for the merchandise manager and salesman. To be most effective this information should be worked up for the individual company's territory.

Detailed analyses are given for selected areas of distribution of population, number of farms and farm acreage, acreage and production of principal crops, livestock and livestock products on farms, and farm value, farm debt and farm income. With the aid of these analyses an index of purchasing power has been worked out for each county or area, depending on the income per farm and the value of land and buildings.

The index of land and buildings per farm is the ratio, expressed as a percentage, between the average value per farm in each county or area and £1 670, which is the national average in the U.S.A.

Expressed as a formula this becomes: Index of land and buildings

$$\text{Value} = \frac{\text{Value per farm}}{£1\,670} \times 100$$

Similarly the index of farm income is the percentage relationship between the average farm income of the county in question and the average for the nation as a whole, which in the case of the U.S.A. is set at the low figure of £470. Thus

$$\text{Index of income per farm} = \frac{\text{Income per farm}}{£470} \times 100.$$

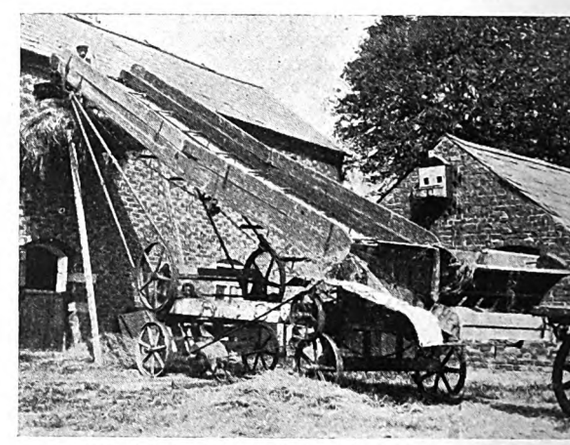
Index of Purchasing Power.

The index of purchasing power is a weighted average of these two index numbers. Since the value of land and buildings represents borrowing power, while the actual income may be more readily used for purchases, the index of farm income is arbitrarily made twice as important as the index of land and buildings value, and is counted twice in making the weighted average.

The formula is:

$$\text{Index of purchasing power} = \frac{(\text{Index of farm income} \times 2) + \text{Index of land and building.}}{3}$$

While the corresponding data permitting the compilation of such indices may be harder to obtain in this country, it seems evident that a considerable amount of investigational work along similar lines is desirable if sales possibilities in this potentially important field are to be thoroughly and soundly exploited.



ELECTRIC MOTORS ON THE FARM.

THIS picture, taken on an English farm, shows one of the many applications of electric motors in the various operations carried on in and around the farm buildings. Considerable savings in time and energy are obtained through the use of electrically-driven unloading equipment.

PLANNING POWER SYSTEMS.*

How to Anticipate the Growth of a Supply Undertaking—Load Density in Residential Districts—Value of Long-Term Estimates.

By A. C. MARSHALL, A.A.I.E.E., and H. A. SNOW.

SYSTEM planning is the general preliminary process of providing for the growth of the system. It should be carefully done, with vision and imagination to foresee and appreciate the future, so as to avoid, if possible, scrapping equipment because of inadequacy before it has served its useful life. A system that grows up without an adequate appreciation of future conditions may reach a stage of development where further expansion cannot be had without tearing down and beginning over again.

The general process of system planning can be divided into two broad divisions, involving, in the first division, the development of a master plan for the arrangement of the system, and, in the second division, the determination of the rate at which construction will be undertaken in carrying out that plan. The master plan should be flexible, it should be capable of adaptation to meet shifting conditions, and it should provide for almost indefinite expansion. Master plans which do not avoid inherent limitations to the growth of a system, such as the presence of excessive short-circuit currents, the lack of adequate quantities of condensing water, or streets choked with conduit runs, etc., are not suitable. There must be a prearranged solution to such foreseen difficulties, which are bound to arise as the system grows, and investment made in accordance with the plan should remain useful for a normal period of life. It should not be rendered obsolete in a few years because an unexpectedly rapid growth has made necessary a complete rearrangement.

The second division of system planning involves the determination of the rate of expansion in accordance with the master plan, so as to avoid, on the one hand, the excessive costs of rush jobs and, on the other, burdensome fixed charges on idle equipment. The solution of the problems of the first division of planning tells the engineer what to do, and the solution of the problems of the second division tells him when to do it.

The engineer must understand the capacities and characteristics of the equipment which is available to his hand; he must foresee limitations and arrange to avoid them; he must dream of far-flung systems, of enormous power plants, of the standards and habits and methods of life twenty and thirty and fifty years from now. And then he must come back to earth and to the sober realisation that additional transformer and cable capacity is needed for next year; to the consideration of just how much and where, and to budgets, time schedules and bills of material.

The inner suburban districts of a great city furnish a concentrated load, which is more regular in its rate of growth and much more dependable as to location than the industrial power load. The business office district, once established, does not move to a new site without notice. Such auxiliary business centres as may develop in a large city are of minor importance, at least for many years. Occasionally, there arises a large and fairly sudden demand for service, such as that occasioned by the installation of air-conditioning equipment in a large departmental store. Transmission and sub-station facilities should be provided for in the master plan which will take care of very high load densities in the heart of the inner suburban district, shading off rapidly at the edges. The exact location of sub-stations is partly determined by the availability of sites. Continuity of service is of particular importance, and very large reserves of throwover capacity are maintained.

Planning in Residential Areas.

With plenty of potential sub-station sites for industrial service along the railway lines, and with the inner suburban sub-station sites tucked away in such odd places adjacent to the load as may be obtained, there remains the residential district to consider. Here planning is especially feasible and may be prettily done. Suitable sites are readily available and load densities per square mile may be determined upon with sufficient certainty that they will not be upset as soon as established. The Detroit Edison Co. is using a tentative figure of 5 000 kVA per square mile as a limit, which should be good for many years to come.

It is only necessary to take a map of the city and arrange the prospective sub-station sites in any symmetrical pattern that seems to make transmission arrangements simple. A diamond pattern permits the interpolation of additional sites at the centres of the diamonds if densities should exceed expectations. With residential sub-stations of 20 000 kVA capacity and a density of 5 000 kW per square mile, one sub-station would serve 4 square miles, and the distance between adjacent sub-stations would be 2 miles. It will be a long time before this load density will be reached.

Prospective Sub-station Sites.

The results of such studies crystallised into definitely located sub-station sites, both present and proposed, are plotted on a map. Such a map permits the purchase of sites well in advance, often at marked savings where land values are rising. It also permits the more intelligent planning of the distribution system, both overhead and underground, particularly when it is considered that this map is based upon load density studies.

The study of prospective sub-station sites makes necessary some ideas as to densities of load which may be planned for in years to come, and suggests a side line of study which is of considerable importance in system planning. This is the study of the performance, the consumption of current and the load characteristics of apparatus and appliances which are coming into use among customers.

In determining the figure of 5 000 kW per square mile for a load density to plan for in residence districts, extensive tests were conducted to determine load characteristics and consumptions in actual service of large current-consuming appliances for residence use, such as electric ranges, electric refrigerators and electrically-driven oil-burning furnaces, and certain assumptions were made as to the probability of the general adoption of these appliances by residence customers. Similar studies of the load characteristics and consumptions of air-conditioning apparatus, electric brass-melting furnaces, electrically heated japanning ovens, etc., furnish a background for the formation of opinions as to possible future industrial loads to be provided for in the master plan.

Almost imperceptibly the discussion of system planning has shifted from the first phase, which is the formulation of the master plan itself, to the second phase, which is the making of decisions as to the rate of building power plants, sub-stations and transmission lines in accordance with the plan. The second phase involves the making of estimates of the probable growth of load. Such estimates may, of course, be extended into the future for considerable periods, say ten years or so, and such long-term estimates are interesting as studies and stimulating to the imagination. But there exists no necessity for estimates of future loads that extend farther into the future than the time required to build the plants and procure the equipment which will be required to carry the estimated loads. Power plants must be planned three or four years ahead, sub-stations a year or two, while a year or even less may be sufficient for transmissions.

Each year the Detroit Co. prepares a general estimate of conditions for the next ten years, including studies of population, sales of current for the several classes of service, peak loads, output, coal consumption, earnings, expenses, investment in fixed capital and rates charged for service. This study is fundamentally an extrapolation, based on records of past performance, but modified by established ideas of probable future trends. The several items comprising the general estimate are very carefully correlated with each other to produce a balanced and uniform study.

In making the ten-year estimate, advantage is taken of the fact that it is easier to form a definite opinion of the probable future values of the ratio between two quantities than it is to estimate the quantities themselves in the abstract. Thus a question as to the total tonnage of coal which will be burned in 1938 meets with only a vague response, while an inquiry as to the probable number of pounds of coal which will be burned per kilowatt-hour of output in 1938 evokes a rather definite opinion. Similarly, ideas of load factors, transmission losses, average wages, cost per ton of coal, kilowatt-hour consumption per customer and customers per thousand

* Based on an address presented to the Power Systems Engineering Committee, Cleveland, Ohio.

Digitized by Google

of population, which are all ratios, are well established, and there is a feeling of confidence in using estimates for such ratios that does not exist when dealing with abstract quantities such as tons of coal, total output, peak loads, total number of customers, etc.

Given a single starting point, which must be an abstract quantity, it is possible to develop the entire study by proceeding from item to item through the use of the ratio figures. The fundamental starting point for the ten-year estimate is the estimate of population; this is linked to the number of customers by a ratio, and this again to the total sales of current by ratios, and so on through the entire study. The last or closing factors in the chain are the rates charged for service.

At the end of each year's business actual figures are substituted for the estimates of that year, and in the light of this knowledge, and of other ideas and facts that have developed during the year, the estimates are reconsidered and revised where necessary, and a new year is added, carrying the estimate one year further ahead.

Estimating the System Peak.

One of the figures developed in the ten-year study is an estimate of the peak load on the system. The first use of the estimate of peak load is in connection with the schedule of additional generating capacity to be installed.

Following the consideration of power plant capacities is a study made of the load on each sub-station at the time of the system peak. The study is based on the load records taken from the sub-station meters. After the load on each sub-station at the time of system peak has been separately estimated, for a period running three years into the future, by extrapolation from the sub-station meter readings, and with corrections for known changes in sub-station areas, the sub-station loads for all sub-stations are added together and checked against the estimated system peaks from the ten-year report, less an allowance for transmission losses. There exists a certain diversity between the load on the sub-stations at the time of the system peak and the non-simultaneous individual peak loads on the several sub-stations, and if this difference is important, a proper correction is made; but in general thess peaks are used in planning transmissions. The ten-year report is used to unify and correlate the estimates arrived at independently for the several sub-stations, and to reveal large errors due to cut-overs and to other abnormal factors affecting sub-station readings.

The above method for studying future sub-station loadings is dependent upon extrapolation from past records of peak loads. Past records, say those which are three or four years old, are apt to have been for areas which are different from the areas now served by the several sub-stations because of cut-overs of distribution circuits to newly constructed sub-stations. Corrections for cut-overs which occurred three or four years ago may be omitted by mistake, and even if remembered, the cut-overs are difficult to evaluate. Besides this, the engineer is dealing with peak loads, which are themselves inherently erratic and poor bases for accurate extrapolation. Furthermore, peak loads cannot be added because they are usually non-simultaneous. Sub-station peak loads are inherently unsatisfactory to work with in estimating the future.

To remedy this unsatisfactory condition the study of the geographical distribution of future loads, for the purpose of planning sub-station sites and capacities, has been attacked from another angle. The metropolitan area has been divided into some 600 small elements of approximately equal size. In the heavily loaded inner suburban district the elemental areas are reduced in size to city blocks. These elements are plotted out on a map and assigned consecutive numbers.

The boundaries of the elements are defined by street and number, so that reference may be made to the customers' billing ledgers, which are so indexed, and statements prepared from the ledgers for each small area of the number of customers and of the kilowatt-hour sales. Customers and sales are divided in the usual way into the several classes of service, residential lighting, commercial lighting, small power, etc., so that there is a complete record of the requirements for electric service of each small area. The power requirements are stated in kilowatt-hours, which are not erratic, and which may be added together; at the proper stage in the calculations they are converted to peak-load figures by the use of normal load factors. Abnormal peaks are taken care of by overload and reserve capacity, and the planning is done for normal peaks.

A field survey is also made of each elemental area. Note is made of the extent to which the area is built up, of the rate at which building is progressing as evidenced by new buildings under construction, and of the character of the district, whether it be residential, commercial or industrial. If apartment houses and flats are beginning to make their appearance this is noted. Factories located in the area are separately studied, and by conference with the sales engineers of the company their future needs are individually considered. The general features of the district are recorded, railways, main thoroughfares, shopping districts, parks, etc. All of the data from the customers' ledgers and from the field survey are concisely recorded and preserved in a file, to be referred to later, when another estimate for the area is to be prepared, so that an idea of the rate of growth and of the character of changes which have occurred since the previous estimate is obtained to assist in making the next estimate.

The next step is to group together the elemental areas which together constitute, or approximately constitute, the territory which is served by the sub-station under consideration. If the result is not satisfactory, the areas may be regrouped to transfer a part of the area to an adjacent sub-station. If a new sub-station is to be built, it is only necessary to add the loads which exist in each of the areas which are to be assigned to the new sub-station to obtain a very accurate idea of the readings on the switchboard meters in the new sub-station when they are put into commission.

This method possesses a number of advantages. Sub-stations may come and sub-stations may go, but the elemental areas remain as they were; there is no confusion of regrouping. The elemental areas may be grouped and regrouped to study new districts and to determine the effect of proposed cut-overs. A third advantage is that the sub-division of the complex problem of load forecasting into 600 smaller problems does much to eliminate confusing complexity.

Having estimated sub-station loads (kilowatt and wattless) for the next three or four years to our satisfaction, the next step is to group the sub-stations into "power areas." The grouping of estimated sub-station loads gives the estimated loads on the source of power for the next three or four years. If the grouped loads exceed the power or the wattless capacity available from the source, the problem becomes interesting. Additional generating capacity may be provided, or sub-stations may be juggled from power area to power area, permanently by re-routing transmissions or temporarily by switching changes in the switching sub-stations. In extreme cases a power area may be split in two and the foundations of a new power plant started, destined to feed the nascent power area.

At times it becomes desirable to "unload" a power area to permit construction work at the power plant. To a limited extent this may be accomplished by switching changes, but at times it is necessary to instal additional transmissions. At other times the power plant men have ideas of their own as to what load they can or cannot carry on cer ain power plants, and they must be consulted before final dispositions are made. They are also inordinately interested in water rates and such like things, and upset otherwise satisfactory loading schedules to further their own ends.

Study of Emergency Conditions.

The next study is the final test of the plans for the next three or four years, which have been based on the assumption of normal operating conditions; it is the study of emergency conditions, especially at the power plants. Proceeding in turn from plant to plant, the assumption is made, one power plant at a time, that the biggest turbine in the power plant goes out of commission. It is a rule that switching changes shall be possible which will immediately care for such a situation if, indeed, any change at all is needed. Then more complex failures are investigated, various combinations of two turbines down, and then of three turbines down at once.

The designs which follow from the study of loads and the decisions as to what additional capacity is called for conform to the master plan. They are incorporated into projects and submitted to the management for executive approval. The collection of approved projects constitutes the construction budget.

To aid the management in the choice of projects for approval, the project sheets are divided into five classes, as follows: Class A, to care for increased load; class B, to increase reliability or safety; class C, to reduce operating costs; class D, to improve appearance of property; class E, miscellaneous.

The budget is the climax of the whole series of studies that began with the consideration of the progress of the art of

Digitized by Google

central-station service and of changes in the habits and methods of living of the people who will be customers of the electrical utility undertaking ten or twenty years from now, and that terminated in the project sheets for new items to be added to the construction programme. Before the project suggested by the engineers is admitted to the budget it must have qualified as being, in the opinion of the management of the company, commercially feasible and advisable. The consideration of general commercial and financial advisability is the last test of the soundness of the proposed project.

A Flexible Budget.

While projects should be approved and added to the budget as early as possible, this cannot, and does not, force the company into rigid and unreasoning adherence to plans which newly arisen circumstances may have rendered inadvisable. The budget itself is flexible and may be changed at any time by adding new projects or deleting old ones. Furthermore, the execution of the projects may be accelerated or retarded as desired. The budget bureau reports to the management that approved plans on file will result in capital expenditures of so much in each month of the next six months or year. If this is not satisfactory the proper executive proceeds to change the plans, and the budget accordingly, and the control department revises the estimates of monthly expenditures. Further than this, the budget bureau of the control department sees to it that, after the executive has approved the plans and turned his attention elsewhere, they are carried out substantially in accordance with his recorded wishes.

THE BATTI-WALLAHS.

Mr. George Balfour Dispels Fallacies at Society's First Luncheon.

OVER 150 members of the Batti-Wallahs Society and their guests met at a luncheon at the Hotel Cecil, London, on Tuesday, when Mr. George Balfour, M.P., was the principal guest, with Mr. H. L. Howard, the president, in the chair.

Mr. Balfour said that constant repetition of the misconception that Great Britain was backward in the development of electricity had so taken hold of the public mind that it was time for the industry to controvert it in unequivocal terms. It was an estimate with which he was in profound disagreement.

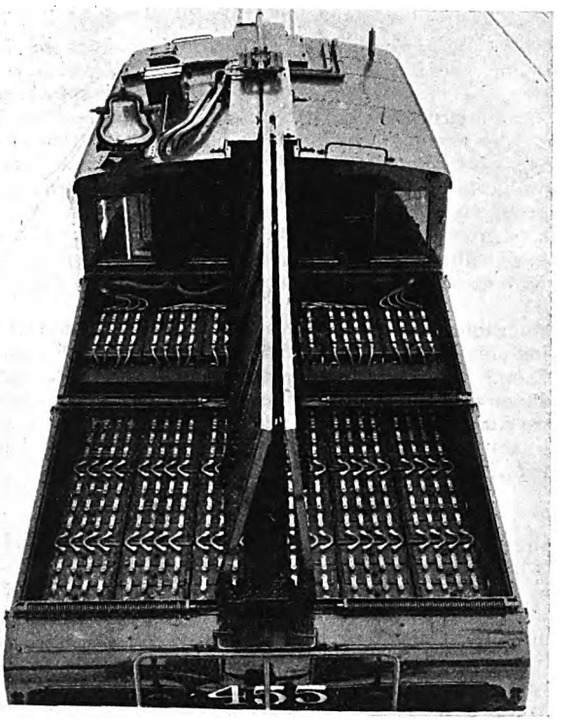
Right in the early days of electrical enterprise this country (Great Britain) led the world electrically, and this continued to be the case until the end of last century.

Efforts to find the basis of the popular idea that we " lagged behind " showed that it was due to a comparison made between countries in which the conditions were vitally different. In the case of the United States, for example, the population in 1880 was only about 50 millions and this comparatively small population not only had a vast territory in which to develop, but also practically an illimitable wealth of natural resources. In this country, on the other hand, we had a population rapidly approaching the saturation point, with its comparatively meagre natural resources largely developed and an old and matured civilisation provided with services which were in competition with electricity. Against this, electricity started in the new country of America without any real competition.

In view of these facts it was dishonest for those who knew them to pretend that we were lagging behind in electrical development.

The allegation that electrically we had no vision also called for denial, for no other country had displayed greater foresight. If only the British industry had been allowed to develop under the recommendations of the Cross Committee we should have gone right ahead. Following the report of this Committee a number of Power Acts were put on the statute book, mostly between 1900 and 1903. The reason why we did not develop rapidly from this point was that we were ahead of the times, and not behind. We were tied down by reciprocating sets and other technical disadvantages, and, in addition, endeavours were made to supply electricity over considerable distances at prices which were quite uneconomic. The three chief factors militating against electrical progress at that time were the use of small power units and reciprocating sets; the fact that nearly every big centre for the supply of electricity was taken over by a municipality and was cut right away from the individual methods of private enterprise; and the availability of cheap fuel, which favoured the use of individual power plants.

At the time of the outbreak of war nearly all the larger municipalities and companies were about to replace their reciprocating sets by turbine units. These projects were all swept aside and at the termination of the war the industry suffered the infliction of committees and officials inspired with all sorts of reforms designed to recondition the electrical industry. The consequence was that we had the crazy legislation that was introduced in 1919, founded on the theory of a cheap and abundant supply of electricity for all. Some of the most vicious principles of this Bill were killed on the spot, but efforts were still being made even now to obtain the cheap and abundant supply.



NOVEL ELECTRIC LOCOMOTIVE.

AN unusual view of a novel type of combined trolley-battery electric locomotive put into service on the Chicago North Shore and Milwaukee Railway. The picture shows the battery compartment and the top of the driver's cab.

It was obvious that the obstacle was not primarily the cost of production, but the cost of distribution and the small density of population in many of the supply areas.

Referring to our hydro-electric resources, Mr. Balfour said we had between 200 000 and 300 000 kW easily available. Considerable hydro-electric development was proceeding in North Wales, and in Lanark, and another interesting project was at Lochaber, where the final development would reach nearly 100 000 kW. This scheme employed the largest cubic content tunnel in the world to take water to Fort William for the manufacture of aluminium. This enterprise, which gave no public supply, would eventually be recorded as the biggest thing of its kind in the world.

If we went ahead and developed our hydro-electric resources so that large blocks of power would be readily available we could attract new electro-chemical and similar industries to this country.

On the proposition of Mr. F. Pooley, a hearty vote of thanks was accorded to Mr. Balfour. Mr. W. Whitgift, the hon. secretary, announced that the next luncheon would be held on November 7th, when Mr. Frank Hodges would give an address.

A photograph appears on page 413.

The Germans and Americans are already realising the possibilities offered by Ireland.—*Mr. William T. Cosgrave.*

MARINE ELECTRICITY.

Four Big Electric Ships Building and Planned in this Country—Electric Propulsion for the Highest Powers—Electricity and its Uses in Navigation—The Supply and Control of Emergency Power.

By A. C. HARDY, B.Sc., A.M.I.Mar.E. (Author of "Merchant Ship Types," etc.).

A RUMOUR is now afloat, which, in fact, is more than a rumour, because it has been substantiated on very good authority, that the P. & O. Company has issued specifications for the construction of two new large passenger liners of first-class type, and owing to the success with which the "Viceroy of India" has operated in service, it seems more than probable that if and when the contracts for these ships are placed, they will be electrically driven.

This is interesting as well as important, because it seems that there will then be building in this country four important ships with electric propulsion, two tankers and two passenger liners.

At the same time comes news from America that a Government loan has been granted to the Dollar Line for the construction of some fast liners, which are to be of the electrical type, in accordance with the details which I have previously discussed in these notes. Therefore it would seem that the era of the electric ship, which has been so consistently preached in the columns of THE ELECTRICIAN, is at last at hand.

An Italian View.

It should here be emphasised, however, that the electric ship is by no means the universal solution to the problem of marine propulsion. It is always a special case, and will have special applications, not the least important of which are passenger liners with high auxiliary power, and passenger liners of extremely high power. In this connection it is interesting to note that at the recent meeting of the Institution of Naval Architects in Italy, a prominent Italian ship constructor, General E. de Vito, devoted quite a considerable portion of an excellent paper which he gave on Atlantic liners, to the question of electric propulsion. He cited two cases in which plans had been prepared for large vessels of the 180 000 shaft horse power type with turbo-electric propulsion, and also mentioned a vessel of smaller type with Diesel-electric propulsion. These examples, coming from so eminent an authority, would appear to indicate that, while one cannot say definitely that either turbo- or Diesel-electricity is the one and only system of electric propulsion to be used in ships of this kind, there are great advantages in both ways of generating the current; and if Diesel-electric propulsion has occasionally been criticised on the grounds of multiplication of prime movers, and of super-multiplication of moving reciprocating parts, then it is also evident that at least there are compensations for these so-called disadvantages.

In particular it should always be remembered that Diesel-electricity gives a power flexibility which is unattainable to such a fine degree with any form of turbo-electricity, for the load can be so finely adjusted by starting up or stopping one, two, three or four generator sets at a time; whereas in the majority of turbo-electric sets so much power is locked up in each individual turbo-generator that a finely divided power gradation is impossible. It is disappointing to note that construction has been held up on the 1 000 ft. design for the White Star Line, which, according to a statement by Lord Kylsant, is to be propelled electrically. It would seem here that the builders and owners cannot arrive in their own minds at a satisfactory solution to this elementary problem of electric powering, and indeed the problem to be solved is no light one, when it comes to a matter of considering powers of 150 000 H.P. and over.

Olympia and Electricity.

Meanwhile, those of us who are interested in the furthering of electrical developments on shipboard have naturally been anxious to see in the recent Shipping and Machinery Exhibition at Olympia just what firms doing business with the marine industry would be showing, and, frankly, it must be said that from this point of view the Shipping Exhibition has been disappointing. One would have expected, with all the developments which have recently been taking place, at least on the part of big firms such as, for example, the British Thomson-Houston Co. and the Metropolitan-Vickers Electrical Co., a display of what they had done, could do, and were interested in doing, in the field of electric propulsion.

Such marine electrical developments as were shown were mainly of the auxiliary nature, and perhaps if we are to judge the trend of an industry by its exhibitions, we may assume that marine electrical firms reckon on obtaining a greater revenue from their auxiliary activities than from the main propulsion business.

Even in these auxiliary activities one did not sense any particular prominence given to the pushing of marine electricity, although, of course, such firms as Laurence Scott, Sunderland Forge, Metro-Vickers, and many others prominent in this trade were well represented.

As I have remarked elsewhere, a feature of development which struck me particularly, and which has not hitherto obtained the prominence it deserves, was the suggestion mooted on the stand of the Premier Gas Engine Co. for the driving of electric generators by means of horizontal airless injection 4-cycle Diesel engines; for here is an advance of such an important nature that it virtually tends to become revolutionary as far as electric propulsion, or even as far as electricity generation, on shipboard is concerned.

The idea of driving a generator by horizontal Diesel engines is not so strange on land as it is at sea, where, with the exception of refrigerating compressors, no horizontal prime movers of any importance are used. Here, however, is a company which is suggesting that generating sets on shipboard should not be driven by vertical prime movers, which take up valuable space, but by horizontal prime movers which absorb only tank top space.

Horizontal Generator Sets.

Assuming this applied to electrically-driven ships of, say, 10 000-15 000 H.P., it is easy to imagine what a revolutionary effect would result upon the interior design of the ship. Decks which formerly had to be broken into for high vertical reciprocating prime movers could now be extended, with the exception of a small escape-way trunk right across the ship, and even in auxiliary engine rooms considerable space saving could be effected.

It is known that at least one shipping company is very seriously interested in this form of generating electricity on shipboard, and while from the point of view of marine electricity one welcomes such development, it is questionable

THE HIGHEST-POWERED ELECTRIC PROPULSION LAYOUTS.

Total Power at Shafts	No. of Shafts.	Type of Drive.	No. of Generators.	Type of Engines.	Remarks.
100 000	4	Diesel	16	2-cycle opposed piston	Each generator develops 4 300 kW.
120 000	4	Diesel	20	2-cycle double-acting	Fuel consumption 0·5 per S.H.P. per hour.
180 000	4	Diesel	8	2-cycle double-acting	Two Diesel engines to each generator. Generators in separate watertight compartments. Weight 55 lb. per H.P.
200 000	4	Turbine	—	500 lb. steam pressure at turbine stop-valve superheat 750 deg. F.	R.p.m. of shafts, 250. Fuel oil consumption 0·65 – 0·7 per S.H.P. per hour.

Digitized by Google

whether the ship-owner himself will be so enthusiatic, because it gives him one more problem to solve in his choice of a prime mover. As has been suggested, these horizontal prime movers can be used either for auxiliary drive or for main propulsion work. They are specially interesting from a point of view of auxiliary drive because it is here that so much development has taken place. This development is now proceeding along the lines of improvements in control.

Hitherto it has been the fashion to arrange heavy, clumsy control boxes near each electric motor. The advantages accruing from the use of push-button start and stop systems have hitherto remained largely untouched. This, after all, is natural, because it is only within recent months, one might almost say, that the electric auxiliary has come to be recognised as superior on all counts to the steam auxiliary for engine room work. And it is only within the last year or so that the electric motor has been recognised as part of the auxiliary which it drives. How otherwise can we explain the clumsy pumps with ungainly motors, operating from noisy spur-gears which have characterised, and still characterise, many so-called modern engine rooms?

To-day the pump maker recognises that the motor is as essential and integral a part of his complete product as was the steam cylinder in the old days, and thus, as too in the old days, he used the best and most compact type of valve to control the operation of his pump, so to-day he is beginning to seek the best and most compact type of switchgear to control his motor. Of particular interest, therefore, was the "Uni-Start" control system exhibited at the Shipping Exhibition by the Sunderland Forge Co., which permits of start and stop push-button control for constant or variable speed motors; the actual control boxes being built by Brookhirst Switchgear, Ltd., of Chester.

Push-Button Control.

While there is, as a matter of fact, nothing particularly novel in the idea of push-button controls for electric auxiliaries, this particular method is of sufficient interest to warrant further discussion. It pre-supposes control of each motor at the motor itself and not at the switchboard, as is becoming the practice in a number of ships—particularly in modern Dutch motor liners, where the standard and technique are said to surpass corresponding British practice. One starting resistance only is fitted for the whole of the equipment, except in cases where there is a big power difference between larger and smaller motor units. There is normally only one starting mechanism for the whole of the machinery. This is the starting resistance controlled by an automatic contactor type starter on the switchboard itself, and is operated by the start and stop pushes on or near to each machine. The push button controls are so interlocked that it is impossible to start more than one motor at a time, and each machine is protected by contactors on the main switchboard fitted with an overload relay, which takes the place of the usual switch and fuses or circuit breakers nominally required, and effects a material saving in space. For constant speed motors, an ordinary push button control is fitted, but on motors which run at variable speeds a suitable regulator for speed is fitted on the starting panel.

It is unquestionable that this system marks an important advance in marine electrical technique, as the advantage of being able to control each auxiliary from the auxiliary itself is no small one. The compactness of the equipment, too, is a point well worth emphasising. It has been mentioned that there is one school of thought (in Holland particularly) which prefers to control all the auxiliary motors from the switchboard itself, and this is quite feasible. Other people consider that it is a safer arrangement to make each unit separately controllable at the unit itself. The idea has hitherto been used very little in British ships, but it is interesting to note that in Henry Ford's big motorship "East Indian," control for individual electrically-driven pumps was arranged at the pumps themselves.

Another important section at the Shipping Exhibition was to be found in those stands which specially concentrated on the application of electricity to the science of controlling and navigating ships, and here of course the gyro-compass stands out as extremely prominent, although in this connection mention should be made of a particularly ingenious American invention marketed in this country by Henry Hughes and Son, of Fenchurch Street, whereby repeaters showing the exact course steered, or to be steered, can be arranged for ordinary standard compasses. Repeater compasses, of course, have long been a feature of gyro-compass navigation; in fact they are one of the great advantages of such navigation, in that master compasses can be tucked away conveniently down in the bowels of the ship, whereas repeaters, as many as are required, can be arranged in the pilot house; on top of the pilot house; and in the wings of the bridge. So far this has been impossible with the standard compass; in fact it is questionable whether anyone has even thought it necessary, but it represents an important little application of electricity which should do much to increase the scope and utility of an instrument which is already a well-tried friend of the ship master.

On two stands in the exhibition, all phases of gyro-electrical navigation were thoroughly exhibited. This has reached its most advanced stage in the Sperry gyro-automatic steering and motor control pedestals, specially designed for a complete fleet of electrically-propelled tankers of the Atlantic Refining Co. One has many times put these ships forward as the complete examples of the electrical era at sea, for in one pedestal about 4 ft. 6 in. high and 18 in. square in horizontal section are situated the control gears for steering (by hand or by gyro), the gyro-compass repeater (which has entirely replaced the ordinary binnacle) and the "throttles" for the main propelling motor. This all represents very advanced thought and I have heard it roundly and soundly condemned by people who have never seen the ships in action.

All-Electric Steering.

On the other hand, the proof of the pudding is in the eating, and it is believed that in no case has any of these "advanced" electric ships been seriously in the casualty list because of lack of manœuvrability or "steerability" at a critical time.

A look round the Sperry, S. G. Brown, Siemens, and Laurence Scott stands at the recent exhibition has really been worth while from the point of view of discovering what electricity is now doing for navigation. Of particular interest to all those who are genuinely concerned with the progress of electricity on shipboard is the fact that, for the first time in a European-built and owned ship, a true Sperry "metal-mike" is to be fitted to the Rotterdam Lloyd motor liners "Baloeran" and "Dempo." Hitherto a gyro-compass repeater and automatic steering gear have been arranged in one pedestal, but placed alongside and directly connected up with the ordinary telemotor steering wheel. The more advanced type cuts out the telemotor link altogether, and does everything electrically. The steering wheel is incorporated in the pedestal, and, by means of a hand lever on the left-hand side, control of the rudder may be switched from "hand" to "gyro" as required. This type of pedestal is practically standard in all American ships with any pretentions to modernity, and has been so for a number of years in cargo ships and liners alike. It was fitted, for example, to every unit in the U.S. Shipping Board's Diesel conversion programme, and in the chart rooms of the majority of these vessels the pedestal is the only piece of navigational apparatus present, with the exception of the engine room telegraphs, which, curiously enough, are of the old chain type.

In Europe the natural field for this type of pedestal has been held closed to a great extent by the suspicion with which seamen still seem to regard all-electric steering. The electrically-operated oil ram steering gear is practically standard in modern European ships to-day, but in this case the pumps, and therefore the motors, are of constant speed and of unidirectional type. The delivery is the only variant, and this is controlled by the reliable old telemotor gear.

The Marine Storage Battery.

A further feature of the Shipping Exhibition was the prominence which was being given to the question of storage batteries. Firms which have hitherto not regarded shipping, beside the submarine field, as anything worth bothering about, are now definitely coming out into the open with the avowed intention of persuading shipping people to use batteries, not only as mere standby devices for wireless telegraphy, but also for use in conjunction with auxiliary Diesel generator sets, to work cargo handling appliances, to run steering gears should the current fail completely, and to operate the whole of the deck lighting and boat control system, assuming that the main engine room, for some reason or other, goes out of control.

There is a growing tendency now on modern ships to arrange for a complete power plant on some upper deck, away from and separate from the whole of the power arrangements in the engine room; and this again seems wise. It would have been entirely impossible in the old days of steam, because electricity can be led and used where steam could never be

Digitized by Google

used. The difference between a carefully insulated cable, and a carefully lagged steam pipe is too obvious to need any elaboration here.

We have suggested before in these notes what might have been possible in the case of the stranded "Celtic," had that vessel been fitted with an auxiliary deck electrical power plant. It is to be hoped that ship-owners will learn something from the fate of the "Celtic," and that underwriters may even insist that legislation should be brought into force whereby complete electrical installation is necessary, not only for emergency purposes, but for general control purposes of all deck gear. It is first and last the extreme flexibility of electricity, combined of course with its economy, that makes it so obviously desirable for marine duties.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

"The Economic Choice of Engineering Plant."

[TO THE EDITOR.]

SIR,—I regret that in my article on the above subject, published in your issue of September 20th, there are two omissions.

The expression for the sum of the geometrical progression near the top of the second column on page 323 requires another bracket, and should read as follows:—

$$\text{Amount at the end of } n \text{ years } = \frac{A\{(1+r)^n - 1\}}{r}.$$

In the list of symbols a little lower down no explanation was given of the symbol G. This is defined as follows:—

G = output of the plant in kW.—I am, etc.,

A. S. FENEMORE.

Stafford.

September 24th.

"Concrete Pole Designs and Costs."

[TO THE EDITOR.]

SIR,—All your readers will, like myself, be pleased to see, from the photos published last week, that Mr. Taylor or some friends of his have made at least one pole in situ; even the men at the top appear to be pleased. We would like to see the cost sheets for the job.

With regard to Mr. Taylor's challenge, he has a ringside manner which is overwhelming. My complete belief in Mr. Taylor's veracity is not to be shaken by an offer of even £1 000 plus 6%, plus £250, plus the usual tolerances for the estimated railway and steamboat fares and subsistence allowances from England to "Dead Man's Gulch" or other obviously distant site of this pole, to confirm Mr. Taylor's rectitude. Besides, as Mr. Taylor declares, I have to stay here to look after Mid-Cheshire, while he "scopes the whole world." Moreover, it would be cheaper to put up a few poles here, and I think it possible that, if Mr. Taylor is willing, a sample line could be arranged for by one or other of the members of the Overhead Lines Association.

For the rest, Mr. Taylor and I are in agreement to this extent:—(1) He scopes the whole world; (2) I cannot; (3) wood lasts well in some places and particularly well in England; (4) ferro-concrete resists white ants, but we have none here.

We do not agree that ferro-concrete deserves a less factor of safety than wood, in England at any rate. In both cases I claim that there is a doubtful quality factor—one due to *nature* and the other to *human nature* which calls for a fairly high "factor of ignorance."

Take that man on the pole on the right—he may be careless when tipping in his concrete, he may forget to ram it or may drop his ramrod and think it too far to go down for it before dinner, and he may start work one day without wetting the surface of yesterday's finish. If, therefore, a factor of safety of 2½ on the elastic limit basis is correct for steel construction, I think 3½ is warranted for wood and ferro-concrete. A pole, whether of wood, concrete or steel, can be made to comply with the Regulations for any span—even 500 yards—and Mr. Taylor's insistence that wood shall be restricted to short span work is ridiculous.

While it is very clear that ferro-concrete and steel are both impossible on short span rural work solely on account of cost, it is clear that wood is as safe as either steel or ferro-concrete for long span work if constructed to the Regulations, and it may be considerably cheaper, which is what we need. Its safety is taken care of by the high factor of safety required by the Electricity Commissioners.

While I am just as pleased to construct a long span wood "A" pole rural line, as I was to try out the long span lattice pole rural line, I am not ready yet to put forward a similar ferro-concrete pole line, because so far I have no real idea as to where to buy or how to construct the poles to comply with Regulations. If Mr. Taylor knows, it is up to him to tell us.

It is his air of mystery which makes us cautious. If he can induce one or two of the well-known construction companies to offer to construct ferro-concrete poles of guaranteed strengths in situ, at competitive prices, to the Regulations and to his designs, we would feel more satisfied that the scheme is practicable in England.—I am, etc.,

W. FENNELL,
General Manager and Engineer,
The Mid-Cheshire Electricity Supply Co., Ltd.

Northwich, Cheshire.
September 30th.

"Where *Is* That Battery?"

[TO THE EDITOR.]

SIR,—"Cynicus" justifies his name by the little joke he makes upon lowering by 10 m.p.h. the average speed of petrol-driven vehicular traffic in large cities. But do not let us confuse the vehicle with the battery; it is the battery which must be kept in mind. I want to assist the discussion by clearing some of the ground.

Let me first remark upon the patent fact that the entire electrical industry is to-day paying heavily for its early technical mistakes. Happily these have been recognised, and their ill-effects are steadily being removed. For instance, vast sums were spent upon the improvement of the reciprocating engine in order to connect it to the high speed dynamo, but the steam turbine has completely clouded the pioneer efforts of Willans, Raworth, Peache, Belliss, Howden and Ferranti. Single-phase supply has given place to three-phase. The baneful influences of bumbledon, which gave us a multitude of voltages, are in process of elimination, and even the railways are becoming resigned to the prospects of a standard system of electrification. These are a few of the chief sections of the industry which have decided to make up for the errors of the past.

Now, I make bold to submit that *in the field of battery traction* the lead-acid accumulator belongs to the failures of the industry, and that this fact calls for immediate recognition and action. Faure and Plante never intended that huge masses of their pet inventions should be moved about; they would perhaps have tolerated their use on petrol cars and for radio sets, but on battery-driven commercial vehicles never!

The battery situation to-day can be summed up in one sentence: "The right battery for the right job."

And this brings me to the next bold statement, namely, let the industry concentrate on the steel alkaline storage battery for all traction services! This type of storage battery has proved its case in a score of years from the construction point of view. Compared with the lead cell which is cast in a foundry it is the product of precision machine tools, and its constituent parts are nickel-plated steel, with an electrolyte which is actually the preservative, rather than the destroyer, of the positive and negative elements. It has a good record in traction service, but it has not had a fair chance to prove its merit in a very wide field. The reasons for this I will not discuss here, because they do not alter one primary fact, which is that the steel alkaline storage battery to-day is an engineering product worthy of the closest attention of the electrical industry.

Now, "Cynicus," it's your turn!—I am, etc.,

"BATTERY ELECTRIC."

October 1st.

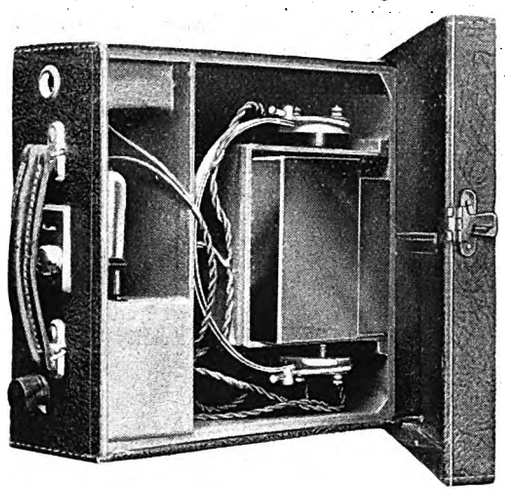
THE NATIONAL RADIO EXHIBITION.

Further Particulars of Some of the Outstanding Exhibits at the Olympia Show—Many Interesting Receiver Designs.

(*Concluded from page* 369.)

THE National Radio Exhibition which closed yesterday, Thursday, was one of the most successful and no less than 297 stands were staged. Although the new scheme of decoration made Olympia's New Hall seem unusually large, even when viewed in comparison with the Shipping, Engineering and Machinery Exhibition in the main building, the site of the Radio Exhibition was only just big enough, and it appears likely that extended quarters will have to be arranged for it next year.



One of the new "Adey" portable sets shown for the first time at Olympia.

The first exhibit to catch the eye was the double stand of GRAHAM AMPLION, LTD. This firm, which will always be remembered best by pioneer radio enthusiasts for their loud speakers, has entered the field of set production this year for the first time, and various models were exhibited. Among these may be mentioned the standard receiver, available for all-mains or for battery operation. The cabinet is of pressed metal with a dull gold finish. The circuit comprises screened grid h.f., detector and two l.f. stages (last stage two super-power valves in parallel). The last stand—by number—in the Exhibition, number 297, contained what was probably the newest production in the show. This stand was occupied by ADEY RADIO, LTD., of 99, Mortimer Street, Regent Street, London, W.1, whose 2-valve portable receiver was recently demonstrated to our representative in the showrooms of the company. This receiver brought in Brookman's Park with excellent volume during the forenoon transmission on the cone speaker incorporated in the set—this despite the fact that there are only two (ordinary) valves, and no aerial outside the set. These results are made possible by the Adey "contact appliance," the design of which has not been disclosed. It appears, however, to consist of a removable key—similar in appearance to a telephone plug—with a "handle" comprising (in its present form) a ring-shaped device, about two inches in diameter, which presumably contains one or more coils. In future models this handle will, we are told, be made square, so that in appearance it will resemble a miniature frame aerial with enclosed wiring. The set will not operate until this switch-key is inserted into its socket, so that the most obvious use of the key is to prevent tampering with the receiver by unauthorised persons. As soon, however, as the key is in place, and its application as a master switch temporarily completed, it fulfils another purpose. The slightest rotation of the key has a marked effect on the volume and sensitivity of the receiver—indeed the key and a tuning dial of the normal pattern appear to be the only controls necessary. We understand that patents for this device are either in existence or pending in almost all countries. All that is stated concerning the key is that "it has an induction effect transmitted to the aerial by the least movement one way or the other." These methods, it is stated, enable the set "to receive stations under almost any wave length." The models about to be put on the market do not appear to be suitable for reception of stations on long waves, but we understand they are shortly to be adopted.

An advantage of the "Adey" portable is its light weight. The model demonstrated (two valves), not only has its weight markedly reduced by the small size of the batteries employed, but also is able to be constructed with overall dimensions giving a cubic content much less than that of the average 3-valve portable. As regards current consumption, the firm states that the 2-valve portable "can be regulated . . . to be of clear tone and quality, with little more tax on the h.t. battery than the average shelf life."

The most interesting exhibit on the stand of S. G. BROWN, LTD., Western Avenue, North Acton, London, W.3, was the "Vee" loud speaker unit. An extra large permanent magnet is used, in connection with a V-shaped reed. There was also a new "Brown" set for home construction, employing a "screened-grid three" circuit. This receiver can be purchased for batteries or all-mains drive, and with or without a built-in speaker. The control panel is ready mounted, and the scheme of assembling is quite simple.

THE RADIO-GRAMOPHONE DEVELOPMENT CO., 7, St. Peter's Place, Broad Street, Birmingham, was one of the few exhibitors showing radio-gramophones only. The set we examined had a particularly good appearance, and is available in oak or mahogany. A diode rectifier is used on the radio side. The firm's electrical pick-up is sold separately, under the name of "R.G.D."

The Chinese lacquering used for some of the cabinet receivers of the GRAMO-RADIO AMPLIFIERS, LTD., of 1A, New London Street, London, E.C.3, attracted considerable attention. One 5-valve instrument has a.c. valves for all-mains drive while an automatic stopping device is fitted to the turntable, which is driven by a G.E.C. electric motor. The speaker is a "Magnavox" moving coil and provision is made for feeding external speakers. This model, which is known by the title of "Olympic" radio-gramophone de-luxe is also available for battery drive, and with a hand-wound motor. In all sets the circuit comprises one-stage screened-grid, h.f., detector and a three-stage l.f. amplifier. A B.T.H. pick-up and "Celestion" loud speaker are standard. There are also "Hercules" models suitable either for batteries or mains, with 4- or 5-valve circuits. Cabinets can be had in oak, walnut or mahogany, with Chinese lacquer if desired.

A novel feature which attracted many visitors to the stand of TRUPHONIC RADIO, LTD., Truphonic House, Hanover Park, Peckham, London, S.E.15, and 137, Regent Street, W., was the control of a 4-valve receiver by means of a Post Office line switch. An ordinary automatic telephone type dial was used to select any one of six broadcasting stations. In the model on view, whose action was demonstrated on the stand by illuminating different points on a glass panel bearing the names of the stations which would ordinarily be brought in, operating the figures 1, 2, 3, 4, 5 and 6 respectively, set the receiver for the following stations: 2LO, 5GB, Manchester, Paris (CFR), Hilversum and 5XX. Dialling "O" switched off the set. The receiver with this system of control is known as the "Truphonic-Pearson-Rendell" automatic receiver. Tuning can, of course, be effected in the ordinary way, if desired.

The "Vee" loud speaker unit of S. G. Brown & Co., Ltd.

Digitized by Google

Among the radio-gramophones at the Exhibition should be mentioned that of the ROYAL RADIO CO., 4-5, Dorset Mews North, Upper Gloucester Place, London, N.W.1. This instrument has an S.G.3 circuit, an "air chrome" loud speaker, and a pilot lamp to give warning when the set is inadvertently left "on." Mains drive is provided for, while a battery model, with a pentode in the output stage, is also available. The Royal Radio Co. also produces portable sets, and one of the most interesting of these is the "straight five" which has drum-control tuning and a built-in wave-trap. There is a choice of materials—including leather, leather cloth and "fabripoid."

An excellent feature of this year's Exhibition was the large number of sound-proof demonstration rooms, and in room "O" were shown the "super-radio"—gramophones of M.P.A. WIRELESS, LTD. (62, Conduit Street, London, W.1.) The "Ethatrope Radio Exchange," as it is called, has two turntables, so that gramophone reproduction may be uninterrupted. The term "radio exchange" is due to the arrangement by which four programmes (British and Continental) may be brought in by simply depressing switches. Illuminated indicators automatically show which station is being received or which gramophone turntable is operating. A separate moving coil speaker can be fitted, in which case an additional amplifier, incorporated in the cabinet, is brought into operation. The frame aerial is within the cabinet, but mounted on a turntable.

Another striking set was that manufactured by BOWYER-LOWE AND CO., LTD., of Letchworth, available for either a.c. or d.c. mains operation. Another cabinet model was the "A.C. Screened Seven" of BURNDEPT WIRELESS (1928), LTD., whose London address is Eastnor House, Blackheath, S.E.3. This set is equipped with two screened-grid h.f. valves, an anode bend detector, one l.f. and two push-pull super-power valves. The "Ethogram" of the same firm is similar on its radio side to the model above described, but has an electric gramophone added.

LEGAL INTELLIGENCE.

Edison Storage Batteries and the Shipping, Engineering and Machinery Exhibition.

IN the Vacation Court, on Wednesday, Mr. Justice Macnaghten heard a motion by Edison Accumulators, Ltd., for a writ of sequestration of the property of New Distributors of Edison Storage Batteries, Ltd., for alleged breach of an order made by Mr. Justice Clauson last July, restraining the defendants from carrying on business in the name of Edison Storage Batteries, Ltd., or any name so resembling that of the plaintiffs as to cause confusion between the two companies.

Mr. Croom Johnson, K.C., for the plaintiffs, stated that in compliance with the order the defendants changed their name to "New Distributors of Edison Storage Batteries, Ltd.," but it was now complained that in breach of the injunction they had advertised their goods at the Shipping, Engineering and Machinery Exhibition, Olympia, under the name "Edison Storage Batteries," without the word "Ltd.," but with the addition of their address, Victoria House, Southampton Row.

Mr. Bray, for the defendants, said that what happened was done without their knowledge or approval. The exhibition authorities, in accordance with the usual custom, asked for their name and address to put over their stall, but were told that this could not be done, as litigation was then pending over the name. Mr. Perrin, the exhibition manager, said that in that case they would put up words indicating the goods to be sold, "Edison Storage Batteries," and without defendants' knowledge added their address.

Mr. Croom Johnson stated that since the motion was launched the address of the defendants was removed from the advertisement, and the exhibition having come to a close, he did not ask for sequestration, but did ask for costs.

Mr. Bray contended that the plaintiffs were not entitled to costs, as there had been no wilful disobedience of the order. The defendants did not put up the advertisement and had no control over the exhibition authorities.

Mr. Justice Macnaghten said that in his view there had been a clear breach of the injunction. It must be understood that when the Court made an order it must be obeyed, but as the address had been removed and the exhibition had come to an end, he would make no order on the motion except that the defendants pay the costs.

Leave to appeal was given.

BRIGHTON EXHIBITION.

Preliminary Details of the Electrical Exhibition to be Opened Next Week.

THE Brighton Electrical Exhibition, organised jointly by the Brighton Electricity Department and the E.D.A., will be opened by the Mayor (Ald. H. J. Galliers) on October 10th. The exhibition will be open to the public from 5 p.m.

THE "Mullard" stand attendants arriving at the National Radio Exhibition by omnibus. In contrast to last year's uniform this year's colour scheme was blue, white, and "sunburn brown."

to 10 p.m. on the first day, and 11 a.m. to 10 p.m. daily from October 11th to 19th inclusive. The exhibition is being held in the Corn Exchange and Dome Buildings. The Corn Exchange is divided into three main sections:—(1) water heating; (2) cooking and heavy appliances; and (3) a fully equipped hotel and restaurant kitchen. The water heating exhibit will be the most comprehensive in electric water heating display yet seen in this country, and the firms exhibiting will be the Credenda Conduits Co., Ltd., Drake and Gorham Wholesale, Ltd., Electric Fires (Norwich), Ltd.; Messrs. E. E. Fellingham, Ferranti, Ltd., the General Electric Co., Ltd., the Hotpoint Electric Appliance Co, Sadia, Ltd., Stott (Engineers) and Co., Ltd., Santon, Ltd., Reyrolle and Co., Ltd., Electrolux, Ltd. Firms exhibiting and demonstrating in the cooking section will be Belling and Co., Berry's Electric, Ltd., Carron Company, the Credenda Conduits Co., Ltd., Electric Fires (Norwich), Ltd., the General Electric Co., Ltd., the Jackson Electric Stove Co., Ltd., Metro-Vick Supplies, Moffats, Ltd., the Hotpoint Electric Appliance Co., the Revo Electric Co., Ltd., Siemens Electric Lamps and Supplies, Ltd., and the Edison Swan Electric Co., Ltd.

The exhibits in the Dome, comprising fittings, fires, refrigerators and miscellaneous appliances, will be provided by Berry's Electric, Ltd., Messrs. E. E. Fellingham, Ferranti, Ltd., Koldah Cooling Machines, Ltd., Messrs. H. J. Galliers, the General Electric Co., Ltd., Metro-Vick Supplies, Page and Miles, Ltd., the Revo Electric Co., Ltd., Siemens Electric Lamps and Supplies, Ltd., Young, Osmond and Young, Ltd., the Brighton Corporation Electricity Department, the E.L.M.A., and the E.D.A.

E.D.A. SALES CONFERENCES.

We give below the programme of the E.D.A. Sales Conferences in the London area for the coming season. Meetings will be held at the Royal Society of Arts, John Street, Adelphi, London, W.C.2, on the third Friday of each month and will commence at 7.30 p.m.

October 18th—"Personal Salesmanship in the Electrical Industry," by Miss G. Burlton, with Sir Andrew R. Duncan in the chair. November 15th—"Selling Time Switches," by Mr. E. E. Sharp; chairman, Sir John R. Brooke. December 20th—Display of electrical cinematograph films. January 17th, 1930—"Domestic Hot Water," by Mr. C. H. Smith, with Sir Hugo Hirst as chairman. February 21st—"The Electrical Industry and the Architect," by Mr. C. H. Flower; chairman, Mr. Ll. B. Atkinson. A meeting will also be held on March 2nd on a subject to be decided by the Conference.

NEWS IN BRIEF.

Poland's Electrical Trade—E.P.E.A. Whist Drive and Dance—Electrical Women in Wales—Annual General Meeting of the Overhead Lines Association—Wolverhampton's Engineer.

MR. J. R. CLYNES, the Home Secretary, will open the Manchester wireless exhibition on October 16th.

An all electric exhibition, arranged by the Northern Counties Electricity Supply Co., was held last week in the Parochial Hall, Saltburn.

Dr. C. C. Garrard lectured to members of the Birmingham Electric Club on September 27th on "Development in Electric Power Control."

A proposal to floodlight the Church of Scotland Assembly Hall and the United Free Church Assembly Hall on the occasion of the union of the churches, at an estimated cost of £200, has been adopted by Edinburgh T.C.

Falmouth T.C. is considering a proposal to light the town electrically.

Princess Mary Viscountess Lascelles is to open the new wing of the Battersea Polytechnic on November 6th.

During July last Poland imported "apparatus, conductors and other electro-technical materials" valued at 8 638 000 zloty (£199 676) and exports of the same classes of goods were valued at 86 000 zloty (£1 987).

The first electrically controlled bridge on the Cheshire side of the Birkenhead Dock Board's estate is expected to be opened early in next summer. It is to be of the bascule type, a single span of 100 ft. being raised and lowered by two 45 H.P. electric motors.

At the Glasgow Housing and Health Exhibition, which was opened on September 26th, there are some interesting electrical exhibits. The Corporation has on view "Magicoal" fires, vacuum cleaners, electric cookers, etc., and an electric kitchen in which daily demonstrations are given of electric cooking, the use of electric washers and wringers, etc., the Falkirk Iron Co., Ltd., shows electric fires and cookers, and Archibald Low and Sons, Ltd., electric hot water storage tanks.

The electric light installation in the Bodleian Library, Oxford, is expected to be completed in readiness for the beginning of the Michaelmas term, on October 12th. The supply is to be cut off when the staff leave in the evenings.

The transfer to Imperial and International Communications, Ltd., of the overseas wireless and cable services of the Post Office, the Pacific Cable Board, the Eastern and Associated Telegraph Companies and Marconi's Wireless Telegraph Co., Ltd., was carried out over the week-end.

A whist drive and dance will be held by the Manchester Section of the Electrical Power Engineers' Association on October 12th in the Cheetham Town Hall. Tickets are 2s. 6d. each and may be obtained from Sectional T.R.'s, members of the Section Committee, and the E.P.E.A., 196, Deansgate, Manchester, and Mr. F. Killeen, "Roche Vale," 269, Rochdale Road, Bury.

The autumn session of the South Wales and Monmouthshire branch of the Electrical Association for Women began on September 24th with a visit to the power station of the South Wales Electrical Power Distribution Co. at Upper Boat. The fixtures include a visit to the City Lodge, Cardiff, where electrical apparatus for treating patients will be inspected, on November 5th; a lecture by Mr. T. Catten, of the E.L.M.A., on "Furnishing your Home with Light," at the South Wales Institute of Engineers, Cardiff, on November 20th; and a cookery demonstration at the G.E.C. showrooms, Womanby Street, Cardiff, on December 3rd.

The annual general meeting of the Institute of Wireless Technology will be held on October 9th at the Engineers Club, London, at 7 p.m.

The annual general meeting of the Overhead Lines Association will be held at the Institution of Electrical Engineers on October 16th, at 5.30 p.m.

Wolverhampton T.C. has received 44 applications for the position of borough electrical engineer, but the Electricity Committee does not consider any of the applicants suitable. The post has been advertised at a salary of £850, and the Council adopted on Monday the Committee's proposal to re-advertise it at £1 000.

LOOKING BACKWARD.

FIFTY years ago THE ELECTRICIAN *of October 4th, 1879, recorded that a demonstration was given in London of an electric miners' lamp.*

The running expenses for one light for one hour with the Gramme A and the Siemens' medium machines were given respectively at 1s. 6d., and 1s. 7½d.

Blackpool was experimenting with the decorative use of electric lighting to attract holiday visitors.

* * *

TWENTY-FIVE years ago, according to, THE ELECTRICIAN *dated October 7th, 1904:—*

An electric lift was to be fitted in the Statue of Liberty in New York Harbour.

Mr. W. Dalby proposed to establish an Electric Club for Birmingham and district.

* * *

FIFTEEN years ago THE ELECTRICIAN *dated October 2nd, 1914, recorded that:—*

"The Point Fives" had twenty members.

Electric taxicabs were in common use in Berlin.

One of the special constable stories then current concerned the sudden emergence from the fog of a cyclist. Having no time to challenge him verbally, the "special" knocked the rider from the machine, knelt on his chest, and asked him where he was going. A censored abstract of the reply disclosed that the cyclist had come to relieve his fellow "special." The operator was the first shift engineer and the victim the chairman of the Electricity Committee.

The new buildings of the Polytechnic in Great Portland Street, London, will be opened by the Queen on October 10th.

The Post Office has decided to make dial telephoning easier for blind persons by making small cuts opposite the figures 4 and seven. The figures 1 and 0 are easy to find, and the new notches will facilitate the finding of the intervening figures.

The Council of the British Engineers' Association has passed a resolution supporting a demand for an inquiry into the national financial policy, the banking system, and the control of credit and currency, with the object of ascertaining what changes are necessary to meet the national and international requirements and conditions of the present day.

Smethwick Education Committee has decided to have the proposed new school at the Uplands heated electrically. Coun. Perry, chairman of the General Purposes Committee, recently informed the Education Committee that the cost of the electrical system was estimated at £4 000, a saving of £1 000 to £1 600 compared with a hot water system apart from a saving in redecoration costs.

The first ordinary meeting of the 1929–1930 session of the Institute of Transport will take place at the Institution of Electrical Engineers, London, on October 14th, at 5.30 p.m., when Sir Josiah C. Stamp will deliver his presidential address Amongst the medals awarded by the Council in respect of the 1928–1929 session is the Institute Graduate Silver Medal, awarded to Mr. A. H. Jackson for his essay on "The Sphere of the Railless Trolley Vehicle System."

The sub-committee appointed by the National Federated Electrical Association and the Electrical Trades Union to give effect to the National wages agreements entered into by those societies on August 7th, 1920, and September 22nd, 1921, declared on September 26th that the variation in cost of living justifies a 29% reduction in the basic rates of wages (April, 1921) and that the hourly rates of pay applicable to the respective grades of the agreements are:—Grade B, 1s. 7¼d.; grade C, 1s. 5¾d.; grade D, 1s. 4¼d.; a reduction of ¼d. in each case.

Applications are invited for the following appointments:—Assistant professor of electrical engineering at the City and Guilds (Engineering) College, London; wireless engineer, for Nigerian Posts and Telegraphs (Crown Agents for the Colonies; ref. M. 1267); assistant electrical engineer for Federated Malay States Government Service (Crown Agents for the Colonies; ref. M. 1734); borough electrical engineer and manager for Loughborough electricity department; electrical engineer to Louth Corporation.

Digitized by Google

PERSONAL.

MR. P. J. Pybus, a director of the English Electric Co., Ltd., is among those appointed to form a Royal Commission to inquire into and report on the conditions of service in the Civil Service.

Mr. G. J. Hollyer, borough electrical engineer of Loughborough, has been appointed electrical engineer and manager to the Torquay T.C.

Col. T. W. Pragnell has been appointed a director of the Westminster Electric Supply Corporation, Ltd., in place of the late Sir Henry O. Bax-Ironside.

Mr. Alan Kirk has been released from his engagement with Troughton and Young, Ltd., in order that he may accept the post of electrical engineer to the headquarters staff of Northcliffe Newspapers, Ltd.

Mr. F. E. Smith, F.R.S., Director of Scientific Research at the Admiralty, has been appointed Secretary to the Committee of the Privy Council for Scientific and Industrial Research, with effect from October 1st, on the resignation of Mr. H. T. Tizard, F.R.S.

Mr. J. W. J. Townley took over the duties of the engineer and manager of the West Ham Electricity Department on October 1st, and the address of Mr. F. W. Purse is now London and Home Counties Joint Electricity Authority, 5, Millbank, Westminster, S.W.1.

The marriage of Mr. E. E. Hoadley, borough electrical engineer, Maidstone, and Miss Helena Nora Smith, was solemnised at St. Paul's Church, Maidstone, on September 17th. The presents included a silver teapot from the Corporation Electricity Committee, and a silver sugar bowl and cream jug to match from the staff of the Electricity Department.

Mr. C. C. Rattey, chairman of the Alton Battery Co., Ltd., left in the "Berengaria" on September 28th en route for the United States, Canada, and the Far East. He will return to this country about the end of February next, via the Straits Settlements, Ceylon and India. Mr. W. R. Montgomery, a director and manager, will be in control of the company's interests during Mr. Rattey's absence.

Sir Ernest Benn, Bt., chairman of Benn Brothers, Ltd., proprietors of THE ELECTRICIAN and allied publications, left London on September 20th, for a trip through Northern Europe. He arrived at Hamburg on September 21st, reaching Copenhagen on the following day. On Monday, Sir Ernest visited Gothenburg, where he addressed the Anglo-Swedish Society on "Politics and Economics," afterwards proceeding to Oslo to address the Anglo-Norse Society on "The Case for Capitalism." Stockholm, Helsingfors, Riga, and Warsaw will be visited in turn, and the return journey will be made via Berlin. In all of these places Chambers of Commerce, trade federations and various economic societies have arranged to entertain him.

An interesting ceremony which took place on September 20th at the London offices of Metro-Vick Supplies, at which Mr. C. McKinlay, who recently resigned his position in the company, was officially presented by Mr. P. F. Crinks, the general manager, with a gold watch suitably engraved, which had been subscribed for by his many friends throughout the organisation. Mr. Crinks, previous to making the actual presentation, paid suitable tribute to the service which Mr. McKinlay had rendered to the company during the eight years he was associated with the foundation and development of the electrical light fittings department, which tribute Mr. McKinlay, in expressing his thanks, acknowledged in appropriate terms. It will be remembered that Mr. McKinlay left Metro-Vick Supplies to join the electrical department of Lane and Girvan, Ltd., as representative for the sale of cooking and heating appliances in England, Wales and Ireland.

Obituary.

MR. HERBERT COLLINSON, on September 27th, aged 47 years. He was a partner in Collinson Bros., electrical engineers and contractors, Aldermanbury, Bradford, a prominent local member of the E.C.A., and a delegate to the Northern Section. For many years he was a teacher of electrical subjects at the technical college evening classes and took a prominent part locally in the question of apprenticeship training.

MR. GEORGE JAMES ALDERMAN, on September 25th, aged 73 years. Mr. Alderman was for many years in business as an electrician in Minster Street, Winchester. Since his retirement about five years ago the business has been conducted by Messrs. Shiner and Cooper.

A HATRY FUSE.

Novel Device for Indicating by Sight when a Fuse has Blown.

IN connection with the publicity given to the name of Clarence C. Hatry, it is interesting to note that Mr. Hatry was the managing director of the one-time Clarence Engineering Co., Ltd., electrical and general engineers, of 3, Cherry Tree Court, Aldersgate Street, London, E.C., while two electrical patents were lodged in his name and accepted. The specifications contained the following information:—

Patent Specification No. 2 353 of 1909 relates to fuses in circuits for lighting and power purposes. The bridge of the fuse is of porcelain or other non-conductive material, and is a hollow box with a lid attached and having at each end a lug carrying the ordinary contact plates and terminals. Inside the bridge is an arm of suitable metal or material hinged at one end and acted upon by a spring underneath, or the arm may be in itself a spring of any suitable shape or design. The other end of the hinge has a hook attached pointing downwards, so that when this end of the arm is depressed the hook protrudes through a hole in the base of the bridge, and the hook is engaged, and thus keeps the arm depressed and the spring in compression. To this depressed end of the arm is attached an indicator of any suitable or attractive design or colour (or the indicator may be in one piece with the arm), which indicator is not visible while the arm is depressed and the wire is intact. When the fuse wire breaks the hook is released and the compressed spring, coming into play, forces the arm and the indicator upwards.

Mr. Hatry also secured a patent (specification No. 11 954 of 1909) for an improved construction whereby a blown fuse may be immediately and automatically replaced. A drum carrying a supply of fuse wire makes a partial revolution as the result of the action of a spring, and the next wire is brought into working position.

BRITISH INDUSTRIES FAIR.

Extensive Additions to the Heavy Industries Section, Birmingham.

THE growth of the Heavy Section of the British Industries Fair which will be opened at Castle Bromwich, Birmingham, on February 17th next continues, and among the developments is an entirely new building, now in course of construction, on the north side of the present 11 acre fair building. This will comprise a dining-room for exhibitors, another for trade buyers, a large conference hall, and a series of private dining-rooms for the use of the numerous trade and professional societies and institutions which have made it their practice for many years to foregather at the Birmingham Fair. Two spacious passages, each 72 ft. by 40 ft., connecting the new block with the main building, will be arranged and furnished as lounges for exhibitors and their visitors, the whole occupying over an acre. The plan of rearrangement has the further advantage of solving—for the present, at any rate—the problem of the ever-increasing demands for space made by exhibitors in the engineering section. The Electrical Section, too, whose rapid growth since its inauguration as a comprehensive display a few years ago has severely taxed the resources of the management, will share the benefit of the general extension scheme.

Negotiations are practically completed for the acquisition of a further 15 acres of land immediately adjoining the present site—an enterprise which will permit of expansions year by year, as circumstances demand, to an aggregate of nearly one-and-a-half times the present size.

Stand lettings in Birmingham for 1930 already beat all previous records, nearly the whole of the accommodation, including the year's extensions, having been booked six months in advance of the opening date.

TRADE INFORMATION.

Many manufacturers are desirous of ascertaining the number of firms engaged in the various trades and professions of the United Kingdom, and electrical contractors and others frequently require information as to the number of the residential classes in different counties. Messrs. SMITH DALBY-WELCH, LTD., of Gresham House, Old Broad Street, London, E.C.2, offer to send a copy of their house organ containing this information to any reader mentioning THE ELECTRICIAN when making application.

BUSINESS ITEMS.

MESSRS. PHILIPS LAMPS, LTD., have opened premises at 62, Union Street Plymouth.

MESSRS. G. ELLAM, electrical wholesalers, have removed to 49, Gartside Street, Bridge Street, Manchester.

The stand of the New Distributors of Edison Storage Batteries, Ltd., at the Shipping, Engineering and Machinery Exhibition which concluded at Olympia, on September 28th.

The LISENIN WIRELESS CO. has removed to 5, Central Buildings, High Street, Slough. The new telephone number is Slough 652.

Mr. A. R. Munday has been appointed the Scotch agent for wood electric fittings of WOODFYT SALES, LTD., and a display of goods will be shown at 190, West Regent Street, Glasgow.

A French firm of agents in Paris desires to secure the representation of British manufacturers of electrical machinery, small tools, etc. Further details from the Department of Overseas Trade. (Reference No. 333.)

A firm in Helsingfors desires to secure the representation for Finland of British manufacturers of cables, wires and open and ironclad h.t. switchgear. The Department of Overseas Trade has further particulars. (Reference No. 332.)

To signalise the opening of new premises at 106, Tavistock Road, Plymouth, W. H. AXWORTHY AND CO., electrical engineers, recently gave an electric lamp free to each purchaser of shades and fittings to the value of ten shillings or more.

Owing to a dissolution of partnership, the business of CONNAL, HODGSON AND CO., electrical and wireless engineers, of the Smelt, Port St. Mary, Isle of Man, will in future be carried on by Mr. Cyril Hodgson, who has purchased the goodwill.

Mr. Austin Tarrant has severed his connection with GRIFFIN, HARDING AND BRYANT, LTD., electrical engineers, of Park Lane, Swindon, Wilts, and has commenced business as an electrical and radio engineer at 125, Rodbourne Road, at that town.

PETTERS, LTD., of Yeovil, have received an order for two 120 B.H.P. Atomic Diesel engines from the Holden Co., Ltd. Montreal. These engines are required for the Canadian National Railways at Nakina, Ontario, for direct coupling to alternators.

A radio and electrical exhibition was held at the Corn Exchange, Spalding, on September 26th, 27th, and 28th, by Mr. W. H. STANGER, electrical and radio engineer, 18, New Road. There were demonstrations with electric cookers, washers, cleaners, and irons, in addition to a display of the latest wireless products.

R. A. LISTER AND CO., LTD., of Dursley, in Gloucestershire, have decided to erect a new foundry on the latest mass-production lines to supplement their existing production. Several new machine shops are also to be built. The new works, which are to cost over £100 000, will cover an area of 100 000 sq. ft., and will enable the firm to double its output.

GABRIEL, WADE AND ENGLISH, LTD., announce that while they have transferred their wholesale sawn wood business in Hull and West Hartlepool to RICHD. WADE, SONS AND CO., LTD., they will continue their business in creosoted poles for overhead transmission lines, etc., without any alteration, at Staddlethorpe (Hull) and Ellesmere Port, under the same management as heretofore.

Messrs. SPOONERS, of Plymouth, on September 16th, signalised the opening of a new and enlarged electrical department by special displays and demonstrations of electrical labour-saving devices, radiators, irons, etc. Throughout the week a representative of Metro-Vick Supplies demonstrated electric cooking, and Hoover, Ltd., demonstrated vacuum cleaners. Electric irons were offered on 14 days' free trial at special exhibition prices.

At a Trades Exhibition held at the Dewsbury Town Hall from September 28th to October 5th, stands were displayed by WARD AND CO., LTD., electrical engineers, of Northgate, Dewsbury, and BEAUMONT AND BLACKBURN, electrical engineers, of 2, Tithe Barn Street, Dewsbury. The former showed a large variety of domestic electric fittings and utensils, and the latter made a special display of "Sandon" electric water heaters and "Oldham" wireless batteries.

H.M. Trade Commissioner at Wellington has forwarded to the Department of Overseas Trade reprints of (1) the schedule of amendments of the New Zealand Government Electrical Supply Regulations, 1927; and (2) the schedule of amendments of the Electrical Wiring Regulations, 1927, which were published in the New Zealand Gazette July 4th, 1929. These reprints are available for loan to British firms on application to the Department. (Reference B. 5 701.)

Mr. T. M. Ainscough, H.M. Senior Trade Commissioner in India, is in this country on an official visit. He will be available at the offices of the Department of Overseas Trade until October 11th to interview manufacturers and merchants interested in the export of British goods to India and will later visit a number of industrial centres in the provinces. Firms desiring interviews with Mr. Ainscough should apply at once to the Comptroller-General, of the Department, quoting reference 832/1/29.

The MARCONI'S WIRELESS TELEGRAPH CO., LTD., has obtained from the Iceland Government a contract for the erection of a broadcasting station. This will be situated at Reykjavic, and is to be completed in time for the thousand years' anniversary of the discovery of the island which will be celebrated in June next year. The transmitter, which will be of a new design, will have a power of 15 kW in the aerial and will work on a wavelength of about 1 200 metres. Special circuits will be incorporated to enable it to be used for telegraphic transmission as well as broadcasting. This will enable the station to be used for meteorological services.

The MARCONI'S WIRELESS TELEGRAPH CO., LTD., has also obtained an order for an extension of the Polish broadcasting organisation which, following the English example, is to be remodelled so as to provide alternative programmes for the greater part of the country. The new equipment will comprise one 120 kW aerial-input broadcasting transmitter with full modulation, two high-power regional stations with 16 kW aerial-input, and three local relay stations. The 120 kW station will be situated near Warsaw and will be used in addition to the 12 kW station which has been in operation there since 1927. The new station will take the wavelength of the present 12 kW station, which is 1 111 metres, and the 12 kW station will work on a lower wavelength. The two stations will be employed simultaneously for the transmission of alternative programmes. The two new 16 kW stations will be situated at Lemberg and Vilna to provide programmes for the areas outside the range of the lower powered station at Warsaw. Of the three local relay stations one will be situated at Lodz, for the definite purpose of providing an alternative "crystal set" programme for the working class district around Warsaw.

THE INDIVIDUALIST MOVEMENT.

The directors of the Individualist Movement call attention to the change of address of the Individualist Bookshop, Ltd., to 53, Victoria Street, London, S.W.1, and ask for help in the formation of Local Study Groups in connection with the Reading Circle. The list of distinguished speakers for the monthly luncheons from October to June next includes Coun. Miss Bright Ashford, the Rt. Hon. Sir J. Tudor Walters, the Marquis of Zetland, the Rt. Hon. Sir Donald Maclean, Sir Charles Grant Robertson, Lord Brentford, the Duchess of Atholl, Dr. E. Graham Little, and the Bishop of Durham. A new feature is a series of Monday lectures on the first and third Mondays of each month at Caxton Hall, Westminster. A leaflet containing particulars of the Reading Circle and Study Group organisations, books of requisition forms for monthly luncheon tickets, and any further information regarding the movement can be obtained from the Secretary, at the Individualist Bookshop.

NEW PREPAYMENT METER.

THE fixed charge automatic collector and prepayment meter put on the market by Messrs. Thomson and Co., 1-3, Old Swan Lane, London, E.C., has been designed and introduced to meet the needs of the small consumer.

The new meter provides for the automatic collection of fixed or basic charges by instalments in addition to the payment for current consumption. Apparatus designed to automatically collect the fixed charge in such a way that the supply is not available until the full amount of the fixed charge has been inserted, possesses the drawback that the consumer has to find the full amount of the fixed charge before he can use any current, and small though these amounts usually are, they are even then an appreciable amount to the person of very modest means and weekly budget.

The fixed charge indicator claims to meet the difficulty, and the amount to be collected as fixed charge can be varied from time to time without the necessity of fitting any change wheels or such-like. This provides a very simple means of collecting any payment that has to be made. In the same way, should it happen that the amount to be collected during the light quarter is not reached, it can be dealt with in one of three ways: (1) The balance due can be carried forward and added to the amount to be collected in the next quarter. (2) The system which has already been adopted by some supply authorities could be utilised, i.e., the fixed charge for the whole year to be divided into two amounts, and these be collected in the winter quarters. (3) In cases where the consumer might be a doubtful payer, the collector could trip the switch and ask for the payment of the balance of fixed charge in cash.

The general operation is that the fixed charge indicator dial (15, Fig. 1) is set to the figure representing the amount to be collected. This is done by means of a small screw key which is inserted into an aperture (17) in the cover, which is opened when the coin box (19) is removed from the meter. Thus the rest of the meter mechanism is still inside the sealed cover, and cannot be tampered with. The dial (16) having been rotated by means of the key in a backward direction until the figure required is opposite the pointer (28), the coin box is then replaced, which automatically closes the aperture (29 and 25). The figure and pointer indicating the amount owing on fixed charge account at any time is visible through a small window in the cover. So long as the fixed charge indicator shows a figure, each coin inserted advances the differential gearing (5) only half the full value, consequently the consumer gets half the value of the coin in current and the other half goes as an instalment off the fixed charge. When the fixed charge is completely liquidated, the meter automatically disengages the half and half gearing (7, 8, 9, 10), and for each subsequent coin inserted the full value of units is given. The actual kWh consumed are registered on the meter dials, and there is a reserve coin counter showing coins unconsumed (27), and up to thirty coins may be inserted at any one time.

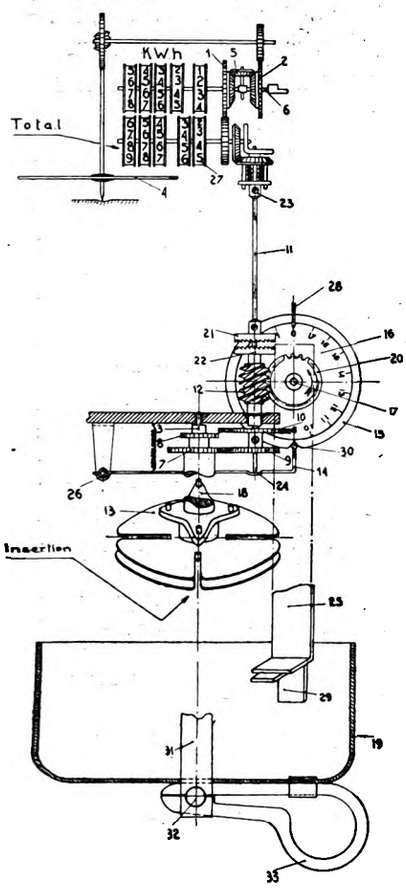

Fig. 1.—The theoretical arrangement of the new meter.

In principle the apparatus operates the two sets of gears marked (7, 8, 9 and 10), these are so arranged that the differential gears (1 and 5) advance only a proportion of the value of the inserted coin, the remainder being arranged to automatically go towards liquidating the amount of the fixed charge. The price per unit is decided by the two change wheels of which a wide range of combinations are standardised.

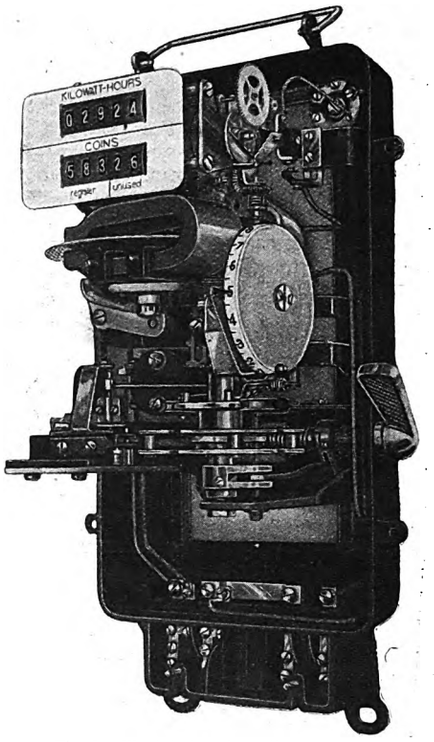

Fig. 2.—The interior of the "Rex" meter.

The prepayment and switching and tripping mechanisms are also interesting. The coin when inserted passes through a guiding channel and takes its position in the radial groove of the insertion discs, the spindle of which is vertical; a curved sector acts as a guide for the coin, and should it not be of correct value the coin drops into a separate compartment of the till without operating the meter. By pushing a handle two special cams are set in motion, and a quadrant carrier placed between the insertion discs is made to rotate, thus moving the coin one-eighth of a revolution and the two rollers engaging with a four-limbed star brings into action a strong spring which carries the coin a further eighth of a revolution. The coin, guided by the curved sector, falls into the coin box. A vertical spindle geared to the insertion disc spindle makes a quarter of a revolution, and acts on a differential gear, and moves the coin register and the reserve coin counter forward one in each case. A small auxiliary contact is lifted by a cam fitted to the end of the differential gear; this opens the auxiliary circuit and the end of the lever rests on the slope of the cam. After eight revolutions of the cam, the lever falls again into the notch of the first cam if the second cam, which revolves four times slower, does not prevent it. This provides a high standard of accuracy for the opening of the switch, so that the impossibility of the current value per coin being exceeded is made quite certain. A switch is tripped into position by the action of one of the four pins on the four-limbed star piece acting on the long switch arm or lever, which is held in the on-position by the edge of a pawl mounted on the relay spindle, and this remains in position until the current circuit of the relay is energised and the switch tripped. On the insertion of further coins, the insertion disc moves a quarter of a revolution; the coins fall into the till or coin box, and their number is registered on both counter dials, and as the current is used the kWh register at the top advances accordingly. A reserve coin counter working through the differential counts off in proportion to the rate per unit, which value can be adjusted by the change wheels. These wheels act on the differential gear, thus moving the small cam until it reaches the position which corresponds with the zero of the coin register, the lever of the contact falls, makes contact, energises the relay and trips the pawl and releases the main switch.

In addition to the fixed charge collector attachment there are other attachments which can be supplied on this meter if required. The first is a "fraud proof" device, by which any fraudulent manipulation of the coin mechanism by the insertion of a piece of wire, thin strips of metal or cardboard, is prevented. This device is most effective in operation, switching off the current and preventing the person getting a supply even though a coin be inserted afterwards. The second is a small tripping arrangement brought outside the case, by which means the reserve coin dials can be re-set to zero. The special use for this is in hotels, etc., where a supply of current is available to temporary residents for heating, ironing, etc.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, where available.

DEAL CORPORATION.—Electric light installation at Town Hall. Particulars from the Borough Surveyor.

SOUTHEND-ON-SEA CORPORATION.—Supply of 2 000 pairs of house service fuse boxes. Full particulars from Mr. A. C. Johnson, acting borough electrical engineer, Electricity Works, London Road, Southend-on-Sea.

WEST RIDING EDUCATION AUTHORITY.—Electric light installation in Silkstone Common School. Specifications from Mr. J. H. Crabtree, Town Hall, Penistone.

Annual Supply of Cables.

GRIMSBY CORPORATION, October 4th.—One year's supply (about 25 000 yds.) of paper insulated, lead covered, low pressure cables. Specification (No. 269) from Mr. S. R. Windle, borough electrical engineer, Electricity Works, Grimsby.

LEEDS GUARDIANS, October 4th.—Electric lighting installation at the two children's homes, Roundhay. Particulars from the clerk, Mr. J. H. Ford, 11, South Parade, Leeds.

CLEETHORPES URBAN DISTRICT COUNCIL, October 5th.—Six months' supply of four-core cable and twin service cable, to B.E.S.A. specification No. 7 (revised), and suitable for working pressures up to 660 V. Further particulars from the clerk, Mr. A. S. Barter.

EDINBURGH EDUCATION AUTHORITY, October 7th.—Electric lighting and heating installations, in connection with Portobello Secondary School enlargement. Specifications, etc., from Mr. J. A. Carfrae, 3, Queen Street, Edinburgh.

HALIFAX CORPORATION, October 7th.—Electrician's work in connection with erection of filter house, etc., for the waterworks department. Specifications, etc., from the Borough Engineer; deposit £2 2s.

SIDMOUTH URBAN DISTRICT COUNCIL, October 7th.—Supply, laying and erection of (*a*) 0·2, 0·2, 0·2, 0·1 sq. in., l.t., paper insulated feeder and additional overhead l.t. mains; (*b*) 0·12 sq. in., four core, l.t., paper insulated feeder and additional overhead mains. Specifications, etc., from Mr. P. C. Tracy, Electricity Works, Sidmouth.

GLASGOW CORPORATION, October 8th.—(1) Water-tube boiler plant; (2) 10 000 kW steam turbo-alternator, with condensing plant and auxiliaries; and (3) e.h.t. switchgear and control gear, for Pinkston generating station (separate tenders for each contract). Specifications, etc., from Mr. L. Mackinnon, general manager, Tramways Department, 46, Bath Street, Glasgow.

GREAT WESTERN RAILWAY CO., October 8th.—October 25th.—Supply of telegraph instruments (list 18); electrical apparatus (insulators, etc.) (19); electric wires and cables (20); electric lamps (24), etc. Samples and patterns may be seen from September 23rd to 27th at the office of the Stores Superintendent, Swindon, where specifications and forms of tender can be obtained. Forms of tender for list 20 will be issued on October 17th. Tenders for list 20 by October 25th and for other above-mentioned lists by October 8th.

PONTEFRACT JOINT HOSPITAL BOARD, October 8th.—Electric light, heating and power installation, at Baghill Hospital. Particulars from Mr. W. H. Newton, Municipal Offices, Pontefract.

WEST RIDING EDUCATION COMMITTEE, October 8th.—15th.—Electric light installation at Thurlstone New School. Specifications, etc., from the Education Officer, County Hall, Wakefield, until October 8th. Tenders by October 15th.

WEST RIDING EDUCATION COMMITTEE, October 8th–15th.—Electric light installation in Featherstone New Middle School and caretaker's house. Specification, etc., until October 8th, from the Education Officer, County Hall, Wakefield.

DUNDEE CORPORATION, October 9th.—Supply of l.t. paper, insulated, lead covered and double steel tape armoured cable, to B.E.S.A. specification for working pressure up to 660 V. Specifications, etc., from Mr. D. H. Bishop, Electricity Department, Dudhope Crescent Road, Dundee.

HACKNEY (LONDON) BOROUGH COUNCIL, October 9th.—One 30 000 kW C.M.R. turbo-alternator and exciter, etc., Specifications from the Borough Electrical Engineer, 18-24, Lower Clapton Road, E.5; deposit £30.

HACKNEY (LONDON) BOROUGH COUNCIL, October 9th.—Fourteen 6 600 V, three-phase, metal clad, oil circuit breaker equipments, each not less than 1 000 000 V rupturing capacity; remote electrically-controlled duplicate busbars; cabling and auxiliary gear controlling one 30 000 kW turbo-alternator, two 30 000 kVA transformers, two 15 000 kW reactance links, one 30 000 kVA busbar coupler equipment, with and without reactance, and six 8 000 kW feeders. Specifications from the Borough Electrical Engineer, 18-24, Lower Clapton Road, E.5; deposit £3.

STANDING JOINT COMMITTEE OF GLAMORGAN QUARTER SESSIONS AND COUNTY COUNCIL, October 9th.—Electric light installation at Cowbridge police station. Specifications from the Police Station or the office of the Deputy Clerk of the Peace, County Hall, Cardiff.

MANCHESTER EDUCATION COMMITTEE, October 10th.—Electric lighting installations at Birchfields Municipal School, Rusholme, and North Manchester High School for Boys, Moston. Specification from Education Offices, Deansgate, Manchester; deposit, £1 1s.

SLEAFORD URBAN DISTRICT COUNCIL, October 10th.—Supply and erection of slate control panel, 4 ft. by 2 ft. 6 in. by 2 in., with s.p. breaker, switch, etc. Full particulars from Mr. W. H. Wilson, Electricity Works, Sleaford, Lincs.

CLUTTON GUARDIANS, October 14th.—Electric light installation at the Institution. Specification, etc., from Mr. J. Wayne Morgan, 9, Mount Stuart Square, Cardiff; deposit £2 2s.

BELFAST CORPORATION, October 21st.—Supply of circulating water pipes. Specification (W.97), etc., from Mr. F. H. Whysall, city electrical engineer and general manager, East Bridge Street, Belfast; deposit £2 2s.

STAINES RURAL DISTRICT COUNCIL, October 21st.—Contruction of sewers and electrical and other equipment for pumping stations. Specification, etc., from the Engineer, Council Offices, London Road, Ashford, Middlesex.

SOUTHWARK (LONDON) BOROUGH COUNCIL, October 22nd.—Twelve months' supply of electric cables. Further particulars from the Electrical Engineer, Penrose Street, Walworth Road, London, S.E.17.

MANCHESTER CORPORATION, October 23rd.—Supply and erection of four 33 000 V, 500 000 kVA rupturing capacity, metal-clad, compound filled switch units, &c. (specification No. 256); and two 10 000 kVA, 33 000/6 600 V, self-cooled, oil immersed, indoor type transformers (specification No. 257). Specifications from Mr. H. C. Lamb, Electricity Department, Town Hall, Manchester; deposit £1 1s. for each.

STAFFORDSHIRE EDUCATION COMMITTEE, October 31st.—Electric light installation in two new elementary day schools in Brettell Lane, Brierley Hill. Specification from Messrs. Moffett, Rosher and Mann, Union Chambers, Temple Row, Birmingham; deposit £5 5s.

CENTRAL ELECTRICITY BOARD, November 9th.—Supply and erection of overhead 33 000 V transmission lines in South Lincolnshire, in connection with Mid-East England scheme. Specification (No. M.E.E.—S.L.1) from Mr. R. H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, Charing Cross, London, W.C.2; deposit £2 2s.

EAST RETFORD CORPORATION, November 19th.—Electrically driven, centrifugal, borehole pump (60 000 gall. per hour). Specification from Mr. S. O. Pacey, Gas and Water Electricity Offices, East Retford; deposit £2 2s.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

BULAWAYO MUNICIPALITY, October 4th (extension of time).—High-tension overhead lines, with appurtenant gear and step-down transformers; pumps and motors with starters, etc. (contract No. 6/29). (Reference A. 8 462.)

SOUTH INDIAN RAILWAY CO., LTD., October 4th.—Supply of convertor equipment for sub-stations (specification No. 6); transformer switchgear and accessories (No. 7); and overhead transmission line (No. 8). Specifications, etc., from the company's offices, 91, Petty France, Westminster, S.W.1.

Digitized by Google

A charge of £1 (not returnable) will be made for each specification.

MONTEVIDEO PORT ADMINISTRATION, October 7th.—Electric trucks, for load of 1 500 to 2 000 kilos, with generating sets for charging batteries, etc. (Reference A.X. 8 353.)

NEW ZEALAND POSTS AND TELEGRAPHS, October 7th.—Supply of 70 000 small galvanised steel insulator bolts (tender No. 151/1 806). (Reference B.X. 5 681.)

VICTORIAN ELECTRICITY COMMISSION, October 7th.—Supply and delivery of 11 000 V three-core cable. (Reference B.X. 5 539.)

MENTAL HOSPITAL, PORTLAOIGHISE (IRELAND), October 8th.—Re-wiring hospital, for the Committee of Management. Specification, etc., from Dr. P. Grace, at the Hospital.

NEW ZEALAND POSTS AND TELEGRAPHS, October 8th.—Indicator alarm fuses (P. and T. No. 151/1802.) (Reference B.X. 5 714).

NEW ZEALAND PUBLIC WORKS DEPARTMENT, October 8th.—Electric ranges, radiators and water heaters, for Waitaki power scheme (section 38). (Reference B.X. 5 642.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, October 8th.—Telephone relays (schedule C. 478). (Reference B.X. 5 655.)

ANTWERP MUNICIPALITY, October 10th.—Supply of 32 portal type electric travelling cranes (cahier des charge No. 800). (Reference A.X. 8 447.)

EGYPTIAN MINISTRY OF THE INTERIOR, October 10th.—Supply and erection of electric generating station for Tala. (Reference B.X. 5 647.)

MOROCCO PUBLIC TELEGRAPH SERVICE, October 10th.—Telegraph posts, insulated copper wire, insulators, g.i. supports and copper binding wire. (Reference B.X. 5 706.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, October 15th.—Switchboard instruments, test plugs and sleeves (schedule C. 472). (Reference B.X. 5 541.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE.—October 15th.—Telephone jacks (schedule No. C. 488). (Reference B.X. 5 695.)

NEW ZEALAND POSTS AND TELEGRAPHS, October 21st.—Supply of switchboard cords (P. and T. No. 151/1813). (Reference B.X. 5 715.)

WELLINGTON CORPORATION, October 21st.—High and low tension switchgear (contract No. 449). (Reference B.X. 5 649.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, October 22nd.—Telephone transformers (schedule C. 474). (Reference B.X. 5 581.)

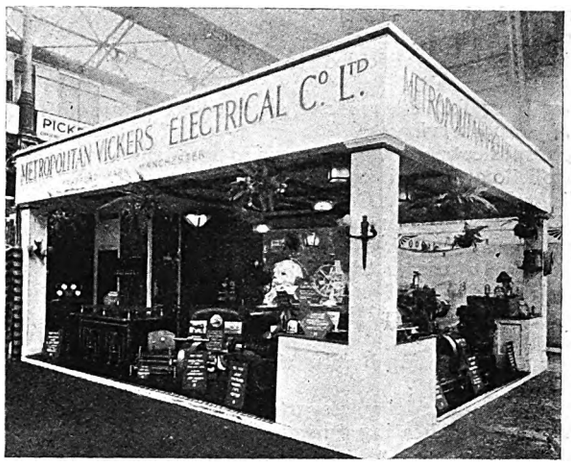
THE stand of The Chloride Electric l Storage Co., Ltd., at the National Radio Show, Olympia, September 23rd-October 3rd.

VICTORIAN RAILWAY COMMISSION, October 23rd.—Dry-core telephone cable (contract No. 43 384). (Reference B.X. 5 638.)

NEW SOUTH WALES GOVERNMENT RAILWAYS, October 29th.—Railway traction motor testing equipment, comprising electric motor, booster, main field excitation generator and short field exciter (quotation No. B.E. 508). (Reference B.X. 5 693.)

JOHANNESBURG MUNICIPALITY, October 31st.—Steel tramway rails, fishplates, manganese points, etc. (contract No. 257). (Reference A.X. 8 523.)

ARGENTINE STATE RAILWAYS, November 4th.—Turbo-generator sets, and headlights for locomotives. (Reference B.X. 5 657.)



THE stand of the Metropolitan-Vickers Electrical Co., Ltd., at the Shipping, Engineering and Machinery Exhibition at Olympia, London, which attracted considerable notice.

VICTORIAN ELECTRICITY COMMISSION, November 4th.—Circuit breakers and operation recorders. (Reference B.X. 5 677.)

VICTORIAN ELECTRICITY COMMISSION, November 4th.—Supply of 6 600 V automatic voltage regulators and spares (specification 29/83). (Reference B.X. 5 637.)

NEW ZEALAND POSTS AND TELEGRAPHS, November 12th.—Four-conductor telephone operators' cords. (Reference B.X. 5 685.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, November 12th.—Supply of 15 kW generating set for installation on the "Maui Pomare" (tender No. 369). (Reference B.X. 5 683.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, November 12th.—Transmitters and associated parts (schedule C. 477). (Reference B.X. 5 653.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, November 12th.—Receivers and associated parts (schedule C. 477). (Reference B.X. 5 656.)

SOUTH AFRICAN POSTS AND TELEGRAPHS, November 14th.—Supply of 400 000 lb. of hard drawn copper wire, 2 000 lb. of soft drawn copper wire and 2 000 lb. of soft drawn, tinned copper wire (tender No. 173). (Reference A.X. 8 510.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, November 19th.—Supply of telephone generators and motor generators (schedule No. C. 479). (Reference B.X. 5 662.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, November 19th.—Motor generators (schedule C. 486). (Reference B.X. 5 694.)

VICTORIAN ELECTRICITY COMMISSION, November 25th.—Switchgear, for Yallourn power station (specification No. 29/103). (Reference B.X. 5 636.)

VICTORIAN ELECTRICITY COMMISSION, November 25th.—Watt-hour meters, recording instruments and remote metering equipment, for Metropolitan terminal stations and sub-stations (specification No. 29/92). (Reference B.X. 5 614.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, November 26th.—Vitreous resistances, each consisting of wire element wound in vitreous spool, for telegraph battery feeds (schedule C. 489). (Reference B.X. 5 696.)

MELBOURNE CITY COUNCIL, November 27th.—Totally-enclosed, metal-clad, 6 000 V, three-phase switchgear (specification No. 1 000). (Reference B.X. 5 708.)

WESTERN AUSTRALIA GOVERNMENT, November 29th.—Supply and erection at Perth of (*a*) boiler house equipment, and (*b*) 12 500 kW turbo-generator and condensing plant. Specifications (£1 1s. for each; not returnable) from the Agent-General for Western Australia, Savoy House, Strand, London, W.C.2.

INDIAN STORES DEPARTMENT, December 3rd.—Ceiling and table fans. (Reference B.X. 5 672.)

ELECTRICITY SUPPLY.

Wivenhoe Public Lighting—Loan for Hammersmith Mains, etc.—New Agreement for Carnarvon Lighting—Sussex Downs Proposals to be Reconsidered—Domestic Apparatus at Oldham—Durham Sanatorium Supply.

COVENTRY Electricity Committee is to extend mains at a cost of £4 846.

Porthcawl U.D.C. has accepted an offer for the electric lighting of the town.

Redcar T.C. has decided to light the new promenade extension electrically.

Shrewsbury T.C. has received sanction to a loan of £10 000 for mains and services.

Brighton Electricity Committee is to proceed with extensions to Portobello at a total cost of £7 250.

Guildford Electricity Committee is to seek sanction for a loan of £20 000 for mains and services.

Kingswood U.D.C. has applied to Bristol Corporation for the extension of cables to parts of the district.

Oswestry T.C. decided on Monday to take over at once the undertaking of the Oswestry Electric Lighting and Power Co., Ltd.

Easington-with-Thorpe P.C. has decided to extend and improve public lighting by electricity at an estimated cost of £500.

Wimbledon electricity department proposes to supply current for water heating during certain hours at 0.33d. per kWh.

Belfast R.D.C. has asked Belfast Corporation to consider the question of supplying electricity throughout the rural district.

A tablet to commemorate the beginning of the erection of the new Kirkstall power station was unveiled on September 23rd.

The Electricity Commissioners have sanctioned the borrowing of £36 400 by Yarmouth T.C. for mains, domestic appliances, etc.

Scarborough Electricity Committee is to apply to the Commissioners for permission to borrow £40 000 for mains, services and meters.

Naas U.D.C. has accepted the offer of the Irish Free State Electricity Supply Board to light 67 lamps for the winter months, at £200.

The Cleveland and Durham County Electric Power Co. is erecting overhead lines for the purpose of providing supplies in the Wear Valley.

Bermondsey (London) B.C. has obtained sanction to borrow £20 000 for mains and services, £2 500 for meters and £7 500 for installations.

Battersea (London) Electricity Committee has received sanction to the borrowing of £30 650 for buildings at the electricity works and £8 970 for plant.

Epsom R.D.C. objects to a proposal by the Central Electricity Board to erect a 33 000 V overhead cable between Harefield Bridge and Windmill Bridge.

The West Kilbride Electric and Lighting Co. has withdrawn its objection to the Ayrshire Electricity Board's proposal to supply to the West Kilbride portion of Airlie.

Barnstaple R.D.C. declines to support the Bideford and District Electric Supply Co.'s application for a Special Order to supply in certain parishes in the Council's area.

Wivenhoe U.D.C. has accepted the offer of Colchester Corporation for public lighting with 96 lamps at £193 5s. for a year, with £4 4s. for an all-night lamp on the quay.

At a public meeting in Killaloe last week it was decided to request the Irish Free State Electricity Supply Board to supply electricity in Killaloe and Ballina at an early date.

Swansea Electricity Committee is to erect a new sub-station at Townhill, and to lay an e.h.t. main from the existing sub-station to the proposed new sub-station at a cost of £1 650.

Electrical Supplies, Ltd., Dromore (co. Down) intends to apply to the Northern Ireland Electricity Commissioners for a Special Order for the urban district and parts of the rural district of Dungannon.

Cuckfield U.D.C. has decided to raise no objection to the application of Central Sussex Electricity, Ltd., in regard to placing overhead lines in the Council's area, provided an underground system is put down in certain thoroughfares.

The Electricity Commissioners have sanctioned the borrowing by Hammersmith (London) B.C. of £64 368 for mains, services, meters, and plant. It is proposed to seek sanction to borrow £12 672 for the replacement of existing h.t. mains by mains of a larger capacity.

Swansea Electricity Committee has decided that the charge for electricity for bakers' ovens will be at the rate of ¾d. per kWh, taken at off-peak periods. A low tension main is to be laid from Pell Street sub-station to Dillwyn Street, at an estimated cost of £1 215.

Cannock U.D.C. has decided to carry out mains extensions to the Pye Green district, and to the new coal distillation plant at the Cannock and Leacroft Colliery. It is also proposed to give a supply of electricity to Wimblebury, and a loan for carrying out the work has been applied for.

With a view to providing work Carlisle Electricity Committee is to seek a grant for a scheme for accelerating the laying of mains at a cost of £13 000 within the next 12 months. —The City Council has applied for a Special Order for supplying electricity to certain parishes in the Brampton and Longtown rural districts.

Carnarvon T.C. has under consideration a proposed agreement with the National Electric Construction Co. for a renewal, for 10 years, of the agreement for the supply of electricity to the town, the charges to be for lighting 6d. per kWh; heating and cooking and other domestic purposes, 2d.; and small power consumers 2½d.

The mid-year review of hydro-electric development in Canada issued by the Minister of the Interior states that during the first six months of 1929 new developments completed and additions to existing plants during the period totalled almost 20 000 H.P. Undertakings now under way, when completed to their designed capacity, will aggregate over 2 000 000 H.P.

The opposition to the proposed erection of overhead lines over the Sussex Downs has led to a re-examination of the South-East England scheme by the Ministry of Transport and the Central Electricity Board. There is some possibility that the demand for underground cables may be conceded, though a decision, which rests with the Minister of Transport, will not be taken for several days.

Oldham Electricity Committee is to make arrangements for the hiring of cookers, wash boilers and fires, hire-purchase of domestic appliances, and fitting up and furnishing showrooms.—The price for energy supplied for electric tube heating systems is to be ¾d. per kWh except between 3.30 p.m. and 5.30 p.m.—The Borough Electrical Engineer is to submit an estimate of the cost of heating the market hall by electricity.

In view of the fact that extensive repairs to the electrical plant at the sanatorium are necessary, Durham County Council proposes to enter into an agreement with the Cleveland and Durham County Electric Power Co. for the supply of electricity for a fixed charge of £60 for each winter quarter and £30 for each summer quarter, plus 2½d. per kWh for lighting and power purposes; and 1d. per kWh for heating and cooking purposes.

Lowestoft Electricity Committee has received sanction to borrow £5 000 for the purchase of meters.—To supply current for driving additional plant at the premises of C. and E. Morton, Ltd., the electricity department is to lay a new cable at a cost of £700.—Mutford and Lothingland R.D.C. has agreed to the suggested route for the overhead line proposed to be used in connection with Lowestoft Council's scheme for affording a supply to Kessingland.

Mr. F. E. Spencer, borough electrical engineer, Birkenhead, has consulted the Electricity Committee in reference to the urgency for the early installation by the Central Electricity Board of the four 10 000 kVA transformers in connection with the new Birkenhead-Wallasey trunk feeders, and has been authorised to wait upon the Board and discuss the matter. —The T.C. has applied for a loan of £3 875 excess expenditure incurred in connection with the scheme for the erection of h.t. transmission lines under the Wirral Special Order, 1925.

The proprietors of the new County Theatre, Castle Street, Dover, are installing their own plant to deal with the bulk of their evening load. The Electricity Committee has approved the proposal of the Borough Electrical Engineer to supply current for the remainder of the company's requirements, under which the company will bear one-half the cost of the extension up to a maximum of £75, and take a minimum consumption to the value of £250 per annum for five years, the maximum demand not to exceed 30 kW from either the d.c. or a.c. supplies.

COMPANY NEWS.

Depression in Electrical Securities—Offer to Purchase Folkestone Electricity Co.'s Shares—Assents to Transfer of Shares to Cables & Wireless, Ltd.—Electricity in Burma Mines—Reports and Dividend Announcements—New Companies.

IN common with other share markets, that for electrical descriptions has shown weakness this week, the only exception to the slight general depression shown by our table of prices being a rise of 1s. 3d. in British Insulated Cables, notwithstanding a deduction of dividend. General Electrics have lost a further 3s. 9d., and Ever Ready are back at 18s. 9d. British Electric Traction ordinary and 6% preference stocks are 5 points lower at 122½, and Undergrounds have fallen 1s. to 22s. Cables and wireless stocks have all shed a couple of points, as also has Western Telegraph 4% debenture stock. Marconi's Marine shares are again 2s. 6d. lower.

NORTH-EASTERN POWER CO.—Extra div. of 75 cents is announced.

LIVERPOOL ELECTRIC CABLE CO., LTD.—Cap. has been increased from £200 000 to £300 000.

BABCOCK AND WILCOX, LTD.—Intm. div. of 7%, tax free, for half-year ended June 30, 1929 (same rate as last year), is announced.

FALKIRK IRON CO., LTD.—Pft. for past year, £972 (agst. £16 701), after provisn. for deb. int., £7 170, and int. on employees' sh. deposits, £3 243.

WEST LONDON AND PROVINCIAL ELECTRIC AND GENERAL TRUST, LTD.—Intm. div. of 4½%, actual, on ord. shs. (same rate as last year) is now payable.

SHROPSHIRE, WORCESTERSHIRE AND STAFFORDSHIRE ELECTRIC POWER CO.—A mtg. will be held on Oct. 16 to consider resolutns. increasg. the number of directors and determing. the directors' remuneratn.

MADRAS ELECTRIC TRAMWAYS (1904). LTD.—Intm. div. at 4s. in £ in respect of pfts. for year endg. Dec. 31, 1929, will be paid to holdrs. of pref. sh. warrts. to bearer, at the Royal Bank of Scotland, 3, Bishopsgate, London, E.C.2.

FOLKESTONE ELECTRICITY SUPPLY CO., LTD.—An offer has been made by the County of London Electric Supply Co., Ltd., to take over the ord. shs. of the Folkestone Co., five County of London shs. being offered for every four Folkestone shs. held.

AMERICAN COMMONWEALTH POWER CORPORATION.—Gross earngs. for year ended Aug. 31st, 1929, $20 953 803; net earngs. $8 954 052, exclusive of National Gas and Power Co.'s rev. Blce. available for common stk., $2 483 682, increase $1 412 235.

RIO DE JANEIRO CITY IMPROVEMENTS CO., LTD.—Sh. trnsfer books are closed until Oct. 15 inclusive, for preparatn. and issue of warrts. for paymt. of intm. div. of 9d. p. sh., being at rate of 7½% p.a., tax free, in respect of rev. for half-year ended June 30.

SUBMARINE CABLES TRUST.—It is announced that the hldrs. of certn. coupons of reversn. have not yet claimed paymt. of the sum which became due to them on the distributn. of the trust funds, that the hldrs. of certn. of the certificates have not yet claimed paymt. of certn. half-yearly int. which became payable on such certificates, and that at the expiratn. of two months from Oct. 1, 1929, the trustees will pay into Court such of the said moneys as have not been claimed within that period.

HASTINGS AND DISTRICT ELECTRIC TRAMWAYS CO., LTD.—The directors propose that paymt. of the half-yearly deb. int. due Oct. 1 and Apl. 1 next be postponed until Oct. 1, 1930, and Apl. 1, 1931, respectively, paymts. postponed to carry int. at rate of 7% p.a. It has been decided to convene mtgs. of the deb. stkhldrs. and notehldrs., and to put before them a scheme which it is hoped will enable the company to carry on until the advantages to be derived from the new trolley vehicle system are fully reaped.

CABLES AND WIRELESS, LTD.—The certificates of "assents" deposited at the close of business on Sept. 25th were as follows: Eastern Telegraph Co., Ltd., percentage of total, 97·86; Eastern Extension, Australasia and China Telegraph Co., Ltd., 98·02; Western Telegraph Co., Ltd., 98·15; Marconi's Wireless Telegraph Co., Ltd., 92·14. The 92·14% of the shs. in Marconi's Wireless Telegraph Co., Ltd., assented represents 89·5 of its nom. issued cap. Assents are still coming in. The company points out that to secure the benefit provided under the Act for relief from cap. duty amtg. to approximately £40 000, it is necessary to obtain assents for 90% of the issued cap. For this purpose, only an additnl. £10 962 in Marconi shs. is now required to be assented.

Company Meeting.

ELECTRICITY FOR MINES IN BURMA.—At the general meeting of Mawchi Mines, Ltd., last week, the chairman, Mr. W. M. McDermott, announced that Mr. W. H. Randall recommended two schemes for the provision of hydro-electric power for the mine and the mill. He advised that the smaller of these schemes should be put in hand first, and that the second and larger scheme should follow at a later date. All the plant and

Digitized by Google

machinery required for the first scheme had been sent out, also additional air compressors and equipment, and the first power station was in operation and reported to be running smoothly. The plant for the second station had been ordered, and it was hoped, would be delivered on the property by about the end of next March. The second power station should be completed in about three months after the arrival of the plant.

New Companies.

CRADNITT, LTD.—Cap., £1 000. Electrical and mechanical engineers, etc. Reg. Office: 5, Brunswick Street, Hackney Road, London, E.2.

CONCERTON RADIO AND ELECTRICAL CO., LTD.—Cap., £5 000. To carry on business as indicated by title. Office: 41, Bedford Square, London, W.C.1.

LITTLEWOOD AND CO. (LONDON), LTD.—Cap., £1 000. Electrical and wireless dealers and engineers, etc. A first director: F. S. Hince, 25, Bathurst Road, Ilford.

A.P.G., LTD.—Cap., £550. Manufacturers of and dealers in wireless, radio gramophones, etc. Reg. office: 515, Salisbury House, London Wall, London, E.C.

IRISH AUTOMOBILE STATIONS, LTD.—Cap., £5 000. Automobile, electrical or general engineers, etc. A first director: W. A. Richards, 20, St. James's Square, London, S.W.1.

AERO DEVELOPMENT AND EQUIPMENT, LTD.—Cap., £100. Aeronautical, mechanical, and electrical engineers, inventors and designers, etc. Reg. Office: 112, Windmill Road, Brentford.

ROWMAL RADIO AND TRADING CO., LTD.—Cap., £2 000. Manufacturers of and dealers in wireless receiving sets, component parts and accessories, etc. Reg. Office: 36, Cannon Street, Birmingham.

WHITEHEAD'S ELECTRICAL INVENTIONS, LTD.—Cap., £1 000. To acquire patents, concessions to manufacture and deal in machinery, plant, etc. Solicitor: C. J. Hardwicke, 109, Queen Street, Cardiff.

MACFARLANE MANUFACTURING CO., LTD.—Cap., £20 000. Enamelled hollow ware manufacturers, electrical and general engineers, etc. Solicitors: Jennings, Son and Ash, 69, Leadenhall Street, London, E.C.3.

A. DEAN AND CO. (NORBURY), LTD.—Cap., £1 000. Electricians, electrical and mechanical engineers, etc. A director: A. Dean, 12, Pollards Hill North, Norbury. Reg. Office: 9, Coleman Street, London, E.C.2.

HARCOURT AND CO. (WIGAN), LTD.—Cap., £5 000. Manufacturers of and dealers in fuse heads or electric fuses for blasting purposes, etc. Reg. Office: Commercial Chambers, Market Street, Wigan.

ASSOCIATED WIRELESS CO., LTD.—Cap., £500. Wholesale and retail wireless instrument makers, electrical engineers and contractors, etc.—Solicitors: C. Butcher and Simon Burns, 32, Gresham Street, London, E.C.

MURPHY RADIO, LTD.—Cap., £6 000. To acquire business of radio manufacturer now carried on by F. Murphy at Hyde Way, Welwyn Garden City, Herts, as "Murphy Radio." Reg. Office: 62/4, Brook Street, London, W.1.

THE LEAD MARKET.

There is no feature of interest to report this week, and according to James Forster and Co. demand from consumers is quiet. Closing prices on September 27th were £23 12s. 6d. for September, £23 8s. 9d. for October, £23 10s. for November, and £23 11s. 3d. for December, or practically unchanged on the week.

COMMERCIAL INFORMATION

County Court Judgments.

[NOTE.—*The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debt. They may be for actions. But the Registry makes no distinction. Judgments are not returned to the Registry if satisfied in the Court books within 21 days.*]

ELLIOTT, W. G., MR., 142, Brighton Road, Birmingham, radio engineer. £34 16s. 4d. July 31st.

GROSVENOR ELECTRICAL SERVICES, 16A, Broadway, Hatch End, electrical engineers. £14 4s. 9d. August 9th.

HEATH ELECTRICAL CO., 9, South End Road, Hampstead Heath, wireless dealers. £18 14s. 8d. July 24th.

MAYERS, A., MR., Herbert Road, Gardiffaith, wireless dealer. £18 13s. 6d. July 26th.

RUDD, MR. A. E., Long Ashton, electrical engineer. £15 0s. 6d. July 24th.

SOUTH ESSEX ELECTRICAL CO., 30, London Road, Romford, electrical engineers. £37 9s. 9d. August 23.

SPENCER, G. J., MR., 36, Maidstone Road, Grays, electrical engineer. £17 19s. 10d. August 22nd.

THICK, MR. G. F., Church Steps, Frome, radio engineer. £20 6s. 3d. July 22nd.

WARDLEWORTH, L. AND V., 355, Bury Old Road, Heaton Park, Manchester, wireless dealers. £20 16s. 8d. July 30th.

Deed of Arrangement.

ROWBOTTOM, Leonard, 20A, High Street, and 19, Beale Street, Stourbridge, wireless and electrical engineer. Dated September 21st, filed September 27th. Trustee, F. E. Bendall, Midland Chambers, Warwick Passage, Corporation Street, Birmingham, accountant. Liabilities unsecured, £352; assets, less secured claims, £110.

Receivership.

PIRIE (J. M.) AND CO., LTD. (R., 4/10/29.) F. H. C. Christmas, of 46/47, London Wall, E.C.2, was appointed Receiver and Manager on September 10th, 1929, under powers contained in debentures dated December 1, 1928.

Mortgages.

[NOTE.—*The Companies Act of 1908 provides that every Mortgage or Charge, as described therein, shall be registered within 21 days after its creation, otherwise it shall be void against the liquidator and any creditor. The Act also provides that every Company shall, in making its annual Summary under the Companies Act, specify the total amount of debt due from the Company in respect of all Mortgages or Charges. The following Mortgages and Charges have been so registered. In each case the total debt prior to the present creation, as specified in the last available Annual Summary, is also given—marked with an *—followed by the date of the Summary, but such total may have been reduced.*]

CARK AND DISTRICT ELECTRICITY CO., LTD.—Registered September 23rd, £1 000 debentures; general charge. *£2 000 debentures. March 5th, 1928.

QUEENSWAY, LTD., London, W.C., electric light engineers. Registered September 19th, £1 020 debentures part of £3 000; general charge. *£1 980. October 2nd, 1928.

WRIGHT (ELECTRIC POWER SPECIALTIES), LTD., Halifax. Registered September 10th, mortgage, to Bank; charged on Century Works, Halifax, etc.

Satisfactions.

LLANGOLLEN AND DISTRICT ELECTRIC LIGHT AND POWER CO., LTD.—Satisfaction registered September 20th, £300, registered March 20th, 1911.

PREMIER WHOLESALE ELECTRIC CO. (STOCKPORT), LTD. (late PREMIER PRIVATE TELEPHONE CO., LTD.).—Satisfaction registered September 24th, £330, registered October 13th, 1923.

London Gazette, etc.

Bankruptcy Information.

HOBSON, Joseph, electrical engineer, 1A, Thorncliffe Grove, Whitworth Park, Manchester, and at Cross Street, Pendleton, Salford. Receiving order, September 26th. Debtor's petition.

Notice of Dividend.

RICHARDS, Stanley Wyndham, the Blackwood Radio and Electrical Supply Depot, High Street, Blackwood, radio engineer and electrical contractor. First and final dividend, 7½d. per £, payable October 8th, Official Receiver's Office, 34, Park Place, Cardiff.

Notice of Intended Dividend.

COHEN, Harry (commonly known as KENNETH COWEN), trading as E. COWEN, 41 and 43, The Village, Lower Bebington, Chester, electrical engineer. Last day for receiving proofs, October 16th. Trustee, J. Allcorn, Government Buildings, Victoria Street, Liverpool, Official Receiver.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

302 909 British Thomson-Houston Co., Ltd. Alternating current commutator motors. (22/12/27.)
315 687 J. E. Allan. Control of the air supply for electric motors and generators. (15/3/28.)
306 932 Felten und Guilleaume Carlswerke Akt.-Ges. Electric hollow conductor. (29/2/28).
316 232 G. H. Scholes, F. J. Pearce and G. H. Scholes and Co., Ltd. Electrical junction-boxes and the like. (26/1/28.)
284 698 W. J. Polydoroff. Radio-frequency amplifying circuits. (5/2/27.)
315 738 T. Teasdale-Kay and H. E. P. Jones. Clockwork-controlled electric time switches. (1/5/28.)
299 354 Magnetic Gauge Co. Apparatus for measuring the difference in current in two circuits. (24/10/27.)
286 200 Telefunken Ges. Fur Drahtlose Telegraphie. Transmission of high-frequency signal currents over electric power lines. (25/2/27.)
287 557 British Thomson-Houston Co., Ltd. Regulating systems for thermionic devices. (24/3/27.)
316 111 J. E. Allan. Control of electric motors for driving winches and the like ship's deck machinery. (15/3/28.)
316 328 H. Leitner. Electric accumulators. (27/3/28.)
316 330 H. Andrewes, D. M. MacDonald and Dubilier Condenser Co. (1925), Ltd. Electrolytic condenser. (28/3/28.)
295 005 Dubilier Condenser Co. (1925), Ltd. Electric condensers. (4/8/27.)
316 332 Burndept Wireless, Ltd. (in liquidation), and J. H. D. Ridley. Microphones. (28/3/28.)
292 550 Landis and Gyr Soc. Anon. Current magnet core for induction meters. (22/6/27.)
290 218 Etablissements E. Jaeger. Magnetic-action speedometers. (10/5/27.)
316 163 S. Tschusoff. Superheater elements. (20/4/28.)
316 336 Y. Mercier. Electric arc treatment of liquid hydrocarbons. (20/4/28.)
316 115 Standard Telephones and Cables, Ltd. (Western Electric Co., Inc.). Radio antenna. (21/4/28.)
316 121 S. G. S. Dicker (N. V. Philips' Gloeilampenfabrieken). Method of influencing an electric current by means of radiation. (23/4/28.)
292 970 Electrical Research Products, Inc. Attenuation devices for acoustic wave transmission systems. (28/6/27.)
316 171 W. E. Beatty (Bell Telephone Laboratories, Inc.). Sound-recording systems. (24/4/28.)
289 385 Siemens and Halske Akt.-Ges. Long-distance transmission systems with Pupin lines. (25/4/27.)
316 340 Dr. C. Ruzicka. Method of and means for the electrical transmission and reception of visual images. (25/4/28.)
289 474 Associated Electrical Industries, Ltd. Circuit interrupters. (29/4/27.)
316 246 H. M. Clarke. Electromagnetic instruments of the moving-coil type, particularly microphone transmitters and loud-speaking telephones. (26/4/28.)
307 866 G. F. Johnstone. Electrolytic etching-machines. (15/3/28.)
289 880 Associated Telephone and Telegraph Co. Telephone systems. (6/5/27.)
302 881 I.G. Farbenindustrie Akt.-Ges. Partitions for separating the electrolytic products in the fusion electrolysis of chlorides, particularly of magnesium. (23/12/27.)
292 498 Associated Telephone and Telegraph Co. Telephone systems. (20/6/27.)
316 350 G. M. Wright. Transformers and circuit arrangements for use therewith. (28/4/28.)
289 489 Soc. Francaise Radio-Electrique. Acoustic instruments. (29/4/27.)

Applications for Patents.

July 5th.

20 709 General Electric Co., Ltd. Luminous electric discharge tubes. (1/8/28, Germany.)
20 710 General Electric Co., Ltd. Incandescent lamps. (1/8/28, Germany.)
20 628 Hoover, Ltd. (Hoover Co.) Protectors for flexible conductors.
20 706 R. J. Kaula. Electric coupling elements.
20 623 S. W. Marlow. Couplings for thermionic valves.
20 749 Maschinenfabrik Oerlikon. Connecting armature windings to electrical machines. (29/8/28, Switzerland.)
20 719 R. S. Miller and Oldham and Sons, Ltd. Apparatus for charging galvanic batteries, etc.
20 715 N. V. Philips' Gloeilampenfabrieken. Apparatus containing Kerr cells. (2/8/28, Holland.)
20 752 Nippon Densen Seizo Kabushiki-Kaisha. Trolley wires.
20 747 Pathe Cinema Anciens Etab. Pathe Freres. Electric lamps in kinematograph apparatus. (23/7/28, France.)
20 671 M. Paul and P. Wangemann. Interrupters for electric currents.
20 699 S. B. Smith. Picture, etc., telegraph systems.
20 705 Symphony Gramophone and Radio Co., Ltd., and H. C. Willson. Vibratory members for telephone reproducers, etc.
20 724 Vereinigte Gluhlampen und Electricitats A.G. Photo-electric cells. (2/1/29, Austria.)

July 6th.

20 810 C. P. Allinson. High frequency thermionic amplifiers.
20 851 Associated Electrical Industries, Ltd., and G. H. Fletcher. Electric vehicles.
20 835 J. L. Baird. Reproduction by telegraphy of pictures, etc.
20 773 British Thomson-Houston Co., Ltd. (General Electric Co. of New York). Manufacture of electric condensers.
20 831 M. A. Bontch-Brouewitch and V. V. Tatarinov. Short wave antennæ.
20 837 W. M. Cranston, and General Electric Co., Ltd. Electrically driven gramophone motors.
20 785 B. Deason. Apparatus for amplifying, etc., electric currents.
20 803, 20,821 A. E. Knowles. Electrolytic apparatus.
20 772 H. A. P. Littledale. Inductances.
20 775 E. B. M. Lochner. Transformers.
20 779 W. Rogers, and Wingrove and Rogers, Ltd. Radio switches.
20 852 Telefunken Ges fur Drahtlose Telegraphie. Radio receivers. (3/8/28, Germany.)
20 853 Telefunken Ges fur Drahtlose Telegraphie. Apparatus actuated by predetermined signals. (19/7/28, Germany.)
20 835 Television, Ltd. Reproduction by telegraphy of pictures, etc.
20 824 Westinghouse Brake and Saxby Signal Co., Ltd. Mechanism for operating railway signals, etc.
20 826 Westinghouse Brake and Saxby Signal Co., Ltd. Electrical control of railway points. (9/7/28, U.S.).

July 8th.

20 965 Associated Electrical Industries, Ltd., and A. Tustin. Electrically-propelled vehicles.
20 966 Associated Electrical Industries, Ltd., and A. Rudman. Electric switches.
20 953 Berry, Wiggins and Co., Ltd., and H. H. Holmes. Containers for electrical apparatus.
20 876 R. Deason. Wireless receiving apparatus, etc.
20 957 S. G. S. Dicker (N. V. Philips' Gloeilampenfabrieken). Wireless receiving system.
20 958 S. G. S. Dicker (N. V. Philips' Gloeilampenfabrieken). Electric discharge tubes.
20 959 S. G. S. Dicker (N. V. Philips' Gloeilampenfabrieken). Installations for rectifying alternating current.
20 913 Felten and Guilleaume Carlswerk A.G. Submarine cables.
20 911 Friemann and Wolf Ges. Pasting grid strips for accumulators. (16/3/29, Germany.)
20 928 Graham-Amplion, Ltd., and A. D'A. Hodgson. Wireless systems.
20 952 M. J. de Groot. Galvanometers. (9/7/28, Holland.)
20 923 P. Muller. Apparatus for regulating electric bells. (11/7/28, France.)
20 956 N. V. Philips' Gloeilampenfabrieken. Electrical contact pins. (19/10/28, Holland.)
20 962 J. E. Pollak (M. Greiner). Electric sounding horns.
21 000 H. Pyle and W. M. Willox. Electrode holder for electric welding.
20 973 S. Ruppel. Electric switches.
20 924 Siemens Bros. and Co., Ltd. (General Dry Batteries, Inc.). Dry cells.
20 947 Siemens and Halske A.G. Printing telegraph transmitters. (25/10/28, Germany.)
20 989 O. N. Tevander. Circuit controlling switches.
20 986 Victor Talking Machine Co. Thermionic valve systems. (1/12/28, U.S.)

July 9th.

21 086, 21 087 Associated Electrical Industries, Ltd., and D. R. Davies. Electrical switchgear.
21 088 Associated Electrical Industries, Ltd. Transformer tap-changing systems. (21/7/28, U.S.)
21 014 F. C. Russon-Bayliss, and Baylis, March and Newey, Ltd. Electric light projectors.
21 101 British Thomson-Houston Co., Ltd. Totalisators.
21 076 Electrical Research Products, Inc. Electro-optical systems. (13/7/28, U.S.)
21 063 R. Eyre. Device for spraying telephone mouthpieces.
21 136 Ferrand Inductor Corporation. Loud speakers. (9/7/28, U.S.)
21 036 A. C. Hyde. Manufacture of thermionic valves.
21 100 International General Electric Co., Inc. Power plants. (10/7/28, Germany.)
21 091 E. F. Northrup. Electric furnaces.
21 119 Siemens-Schuckertwerke A.G. Absorption refrigerating machines. (27/7/28, Germany.)
21 118 Siemens and Halske A.G. Protecting measuring instruments against short circuits. (25/7/28, Germany.)
21 073 Soc. Française Radio-Electrique. Printing telegraphs. (28/7/28, France.)
21 110 Vereinigte Eisenbahn-Signalwerke Ges. Electrical train-influencing systems. (4/8/28, Germany.)
21 081 Wired Radio, Inc. High frequency generator circuit. (31/7/28, U.S.)
21 082 Wired Radio, Inc. Multi-electrode tube oscillator circuits. (31/7/28, U.S.)
21 092 Siemens-Schuckertwerke A.G. Lead cables. (10/10/28, Germany.)

July 10th.

21 234 British Thomson-Houston Co., Ltd., and E. H. B. Martin. Protective devices for electric circuits.
21 235 British Thomson-Houston Co., Ltd., and C. G. Gartin. Thermionic valves.
21 236 British Thomson-Houston Co., Ltd., and C. G. Gartin. Transformers. (10/7/28, U.S.)
21 264 Carborundum Co. Electric furnaces. (7/12/28, U.S.)
21 250 T. K. Cordes. Electric cable connectors.
21 194 Electrolux, Ltd. (Platen-Munters Refrigerating System Aktiebolag). Evaporator units for refrigerating. (28/2/29.)
21 216 J. E. Ferguson and J. Ferguson and Sons, Ltd. Electric battery boxes, etc.
21 256 General Electric Co., Ltd., C. W. Stopford, and E. C. Walton. Electric switches.
21 197 Hirsch Kupfer-und Messingwerke A.G. Electrolysis of fused electrolytes. (7/8/28, Germany.)
21 173 L. Levy. Electrotherapeutic treatment apparatus.
21 268 Pioneer Instrument Co., Inc. Illuminated panel arrangements. (26/3/29, U.S.)
21 255 A. L. Reimann. Electron discharge tubes.
21 179 A. R. A. Rendall, E. K. Sandeman and Standard Telephones and Cables, Ltd. Telephone systems.
21 222 J. Sinclair-Ross and J. Zetsche. Apparatus for control of electric motors.
21 161 S. Ruppel. Electric switches.
21 230 F. A. Thomassin. Talking picture apparatus.
21 231 F. A. Thomassin. Reproduction of sound from photo-electric records.
21 200 K. Tihanyi. Television apparatus. (12/7/28, Hungary.)

COMING EVENTS.

Tuesday, October 8th.

Electrical Contractors' Association (Swansea Branch).—Ordinary meeting.

Electrical Contractors' Association (Leicester Branch).—Corridor Chambers, Ordinary meeting. 2.30 *p.m.*

Illuminating Engineering Society.—E.L.M.A. Lighting Service Bureau, 15, Savoy Street, Strand, London. Opening meeting. 6.30 *p.m.*

Wednesday, October 9th.

Electrical Contractors' Association (Eastbourne Sub-Branch).—South Street. Ordinary meeting.

Electrical Contractors' Association (Sheffield Branch).—Ordinary meeting. 5.30 *p.m.*

Institute of Wireless Technology.—Engineers' Club, Coventry Street, London. Annual meeting. 7 *p.m.*

Thursday, October 10th.

Electrical Association for Women.—Visit to Messrs. Kelvinator, Ltd., Alexandra House, 29, Kingsway, London. Lecture by Mr. F. E. Kewley on "Electrical Cold that Keeps." 3 *p.m.*

Electrical Contractors' Association (East Yorks Branch).—Metropole Hall, Hull. Ordinary meeting.

Electrical Contractors' Association (Nottingham Branch).—Ordinary meeting.

Electrical Contractors' Association (Birmingham Branch).—Ordinary meeting.

Saturday, October 12th.

Association of Mining Electrical Engineers (Western Sub-Branch).—Chairman's address.

27th A.A. Battalion. R.E. (T.A.)—Battalion Dance. Headquarters, Rochester Row, London, S.W.1. 7.30 *p.m.*

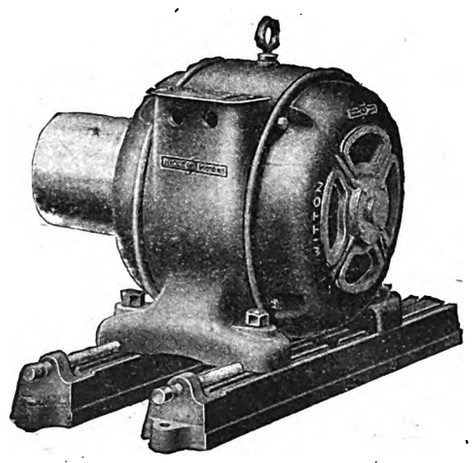
HIGGS (HM) MOTORS

PROPRIETOR WALTER F. HIGGS, M.I.E.E.

WITTON BIRMINGHAM



A.C. D.C.

Six months ago we placed on the market our type "R" Repulsion Induction Motors. They met with instantaneous success. We have already supplied large numbers to our customers at Home and Overseas. Although they were an entirely new development, we have yet to receive the first complaint or adverse criticism of any description whatever. On the contrary we have been complimented on very many occasions. If you want value for money come to HIGGS MOTORS.

The Sussex Downs Farce.

THE opposition to the erection of the Central Electricity Board's overhead lines on certain parts of the Sussex Downs is rapidly degenerating into a farce, the actors in which are for the most part more remarkable for the intensity of their enthusiasm for a reactionary cause than for an exhibition of knowledge of what is and what is not possible in a scheme of this kind, or even of the quality commonly known as horse-sense. The star item of this farce, which many electrical engineers have thoroughly enjoyed, was the publication in a daily paper noted for its care for the amenities of the countryside of a large picture of ROBERT LOUIS STEVENSON'S home at Swanston, together with a statement that a proposal is afoot to acquire the cottage and the valley in which it stands as a public park. The lay reader saw in this picture nothing more than a delightful rural panorama, but electrical engineers, ever on the look out for evidences of their handiwork, were able to discover, in the corner of a field in close proximity to the R.L.S. home, what was unmistakably one of the double circuit 132 kV towers erected for the purposes of the Scottish grid scheme. While the opposition was devoting its energies to side-tracking matters of fact which were put forward by individuals from the electrical point of view, they failed to notice the "soaring pylon" or "Eiffel Tower," which had reared itself up in yet another beauty spot, until Mr. J. F. SHIPLEY very rightly directed public attention to it. Obviously, after an example of this kind, people who continue to maintain the attitude that the "grid" lines will gravely disfigure the landscape will never let themselves be convinced by anything, and must be regarded as opponents of progress in any shape or form. The delaying effect of this agitation on the progress of the Central Board's work cannot be regarded as good from the electrical point of view, and the Board's position of being unable, even if it had so desired, to indulge in public altercation over a matter that was *sub judice*, was one of some difficulty. In our opinion the Board has throughout shown the greatest possible consideration for the expressed wishes of those likely to be affected by the operation of its schemes, and has generally taken care not to cause offence to anybody. This policy, of converting opposition, both real and potential, to co-operation is one that we consider to be essential to the ultimate success of public utility enterprise, but its results to-date in the South-East England scheme are not too encouraging.

More Misrepresentation.

THE propaganda against the erection of the London Power Co.'s new power station at Battersea—progress at the site of which is depicted elsewhere is this issue—has broken out again in intensified form, and the popular Press is full of glaring headlines, of which "Power Station Menace to London" is a modest example. So long as honest doubt existed as to the possibility of preventing the emission of sulphurous fumes from this station the agitation was justifiable, though we think it might have been avoided if the Power Co. had made an earlier decision to give to the public an unequivocal assurance that the anticipated nuisance would not occur. Their very definite assurance that a commercial solution of the fume problem had been found, and would be employed, allayed the fears of many people, and those who are not prepared to take the company's word had the additional safeguards of an inquiry and a report by the Government Chemist and the Government's promise to withhold consent to the full development of the site should the initial part—only one-third of that projected—give offence. Apparently even this threefold check is considered insufficient by the opponents of the scheme, if a picture in Wednesday's "Daily Mail" is intended to be taken seriously. The art of superimposition, which achieved such startling results in the Sussex Downs case, is again employed, and upon a picture of the Thames is grafted, on the actual site of the new station, a picture of an existing power station. This transport feat has been undertaken "to show how poisonous fumes, unless means are discovered to eliminate them, would spread over a large area of London." The invisible sulphur emissions are represented in the picture by huge clouds of smoke coming from the chimney stacks, and the smoke is blowing in a direction almost exactly opposed to that which it might normally be expected to take under the direction of the prevailing wind. Such trivial matters can hardly

Digitized by Google

be expected to worry the popular daily papers, but it is unfortunate for the electrical industry that a considerable body of public opinion is formed on such misleading information.

Lighting Fittings Design.

As the first journal in this country to describe and illustrate the modernist trend in lighting fittings design, we have followed its development with particular interest, as representing the first real and practicable attempt to design a proper setting for an essentially modern illuminant. For the first time since electricity was used for lighting, a conscious effort was made to evolve fittings possessing some æsthetic value and novelty of form, and it was only natural that the new movement should attract wide and imitative interest. The new styles were essentially Continental in conception and manufacture. Considerable quantities of these productions found their way to the British market, and, as these were favourably received, certain British manufacturers turned their attention towards the production of fittings designed to harmonise with modern architectural forms. Unfortunately, with but few exceptions, these efforts have not been æsthetically satisfying, for while no fault can be found with the quality of materials used or with the actual manufacture, the bulk of the British production to date has lacked the fine sense of design which was so delightfully apparent in the work of some of the eminent French and German craftsmen in glass and metal. This disability is, we believe, but a temporary one, and entirely due to the failure of many of those responsible for the production to realise that the designer of heavy engineering plant is not necessarily the best man to be entrusted with the creation of delicate lighting fittings. In fact, the average engineering designer is hopelessly out of his depth in a matter of this kind, and it is obvious that the few firms who have left this work to men endowed with the necessary artistic ability are the only ones who have been successful in producing fittings that appeal to the really discriminating purchaser. A praiseworthy attempt is being made by the General Electric Company, in co-operation with the organisers of the Ideal Homes Exhibition, to discover native talent which is capable of application to this interesting problem. Prizes to the value of £1 000 will be offered in a competition based on the lighting and decoration of a suite of six rooms. The interest which this competition will arouse among British decorative artists and designers will undoubtedly assist in the development of British lighting equipment suitable for employment in modern interiors.

Electrical Equipment for Manufacturers.

THE varied descriptions of electrical equipment for manufacturers which we publish each month are further evidence of the progress of electrical development. The fact that such equipment is designed to cover so many fields is indicative of the wide uses to which such plant is applied, and substantiation of this fact, if any is required, is given by the descriptions, published elsewhere in this issue, of apparatus so widely different in its uses as industrial lighting and mine prospecting. Manufacturers of industrial electrical equipment should bear in mind that considerable opportunities await them in the overseas markets. Italy, for instance, imported last year carbons for electric furnaces valued at 11 230 600 lire, which suggests that the use of such furnaces is well established. Importations of electrical equipment not specially specified were valued at 72 339 200 lire, while earthenware and glass insulators were valued at 1 377 400 lire and 194 200 lire respectively. At the moment Germany is the most important source from which Italy draws foreign material and supplies, as in the case of most other industrial or technical equipments. This is not only true with regard to total quantities imported, but also as applied to almost every class or group of items. The growing activity of the electrical industry and of industries using electrical equipment in Italy is not only indicated by increased imports of appropriate machinery and material, but also by the amount of power generated and used in the country. The kilowatt hours generated by 200 to 300 private and public undertakings in 1928 furnished about 84% of the country's supply of energy, and showed in comparison with 1927 an increase of 947 865 000 kWh. This in itself should indicate to manufacturers that the Italian market is worthy of attention, even in competition with Germany, the nearer neighbour.

Electrical Inventions.

THE inventions shown at the Exhibition of Inventions which closes to-morrow, Saturday, emanate not only from various parts of this country but also from China, New Zealand, Yugoslavia, the U.S.A., Norway, East Africa, Australia, South Africa, India and Germany. These exhibitions, of which this is the fifth, always contain something of electrical interest, and this year is no exception. The domestic field appears to be the more prolific, for no less than two domestic irons are shown, portable telephones which can be used in the house bell wiring system, cigar and cigarette lighters, electric door bolts and egg testers are also among the exhibits. We give elsewhere in this issue particulars of some of the inventions, together with details of some of the items shown by manufacturers. These latter include a new type of vacuum cleaner which, though of the "non-bag" variety, is also a departure from the "enclosed dust collector" type, the whole machine resembling somewhat an inverted pail. Wireless inventions are few this year, the most interesting perhaps relating to a seamless vulcanite core for loud speaker diaphragms. The exhibition is well worth a visit, if only to reveal the lines of thought taken by inventive genius.

"Electrificatzia."

STUDENTS of conditions in Russia following the Bolshevik revolution will have noted how many Russian parents named their children "Revolutzia" to signify their faith in the great social upheaval that was to provide a new life for millions of people. Now, however, a writer in the "Review of Reviews" points out that a new name is being given to Russian infants. "Electrificatzia" is the name, which, being translated, simply means electrification. The change is not without significance, and some may see in it an indication that, whereas it was at one time the revolution that seemed to be the harbinger of hope for Russia, it is now electricity that occupies that position. More mysterious and incalculable than the forces of revolt, electricity also differs in its capacity for being controlled and put to work. The Soviet leaders themselves seem to recognise this. They have an elaborate hydro-electric programme in preparation, including the great Dnieper project, and expect by the end of the year to have increased the national generating capacity to a figure approximately 800 per cent. above that of 1923.

The Cable Competition.

As readers will see on a later page of this issue, the solutions of the Cable Competition, organised in aid of the funds of the Electrical Trades' Benevolent Institution, have now been issued. The clues to the names of the towns through which the mythical cable was to pass will probably have puzzled few of the competitors for long, but we shall be surprised if many entrants were successful in arriving at 1 496½ miles, the exact length of cable required to link up the places concerned. Whether or not they win or lose, those who have competed will have combined the working out of an interesting problem with a direct financial contribution to the funds of a very deserving charity. Those who did not take part in the competition can also help, and in a still more effective way, by becoming annual subscribers under an appropriate membership grade, or, if they are already members, by persuading at least one other member of the electrical industry to follow their example.

INSULATING PAPERS.

Non-ageing Grades for Electrical Applications—Advantages of a Cotton Base—Improvements in Chemical Wood Pulp Papers for Cable Manufacture.

By A. R. DUNTON, A.M.I.E.E., and A. W. MUIR, D.S.O., M.C., B.Sc.

PAPER is an outstanding example of a material developed for other purposes, but adopted, improved and extensively used as an insulator. It is interesting to note, moreover, that, generally speaking, the principles on which it has been developed and improved for other uses have been effective, in conjunction with special blending and the elimination of impurities, in its development for electrical purposes. Just as "rag" papers, of cotton or linen fibre, are used for the best work in the printing trade, so they are definitely the best for insulating work in which good ageing properties are essential. Further, just as substitute materials, especially wood pulp, have been developed to a satisfactory quality for lower grade printing and general uses, so these materials have been made satisfactory for some electrical applications.

The method of making Egyptian papyrus, the forerunner of paper, dating back to about 3 500 B.C., represents in crude form the modern methods of paper production. The pith of the marsh-growing papyrus plant was cut into thin, long strips, which were laid side by side, gummed over with a bonding medium, and reinforced by a second layer of strips, laid across the first, the sheet so formed being finally pressed, dried and polished. A remarkable example of this early

Fig. 1.—Microphotograph of cotton fibres : magnification 1/92.

material is the "Theban Book of the Dead," preserved in the British Museum, a roll 122 ft. long by 21½ in. wide.

The first production of paper from the finely divided fibres of plants is credited to the Chinese, dating back to about 100 A.D. or possibly earlier, but the method was kept a close secret for several centuries, until the knowledge was wrested from Chinese captives by the Arabs and the Moors. In the eleventh century, the Moors brought the process to Spain, whence it spread over Europe. Notable among early English mills are Tate's Sele Mill, of 1495 A.D., at Stevenage, Hertford, and Whatman's Mill, of 1760 A.D., at Maidstone, Kent. It was not until the years 1803 and 1821 that paper-making machines were developed in England, by Gamble, the Fourdrinier brothers, and John Dickinson. Since that time, however, very great refinements have been introduced, resulting in the selection, blending and treatment of fibres to give papers for as many as about 130 different uses recognised by the trade.

The best non-ageing papers for electrical applications are made from rags of cotton and linen, and to a less extent from ropes, jute, hemp, etc., and are prepared by the alkali boiling process. The materials are carefully selected for particular purposes, the rags, for instance, being chosen from about thirty different grades, and are picked with a view to freedom from undesirable foreign materials such as pins, buttons and metal fasteners, wool, elastic and dirt. The selected material is first cut into small pieces and subjected, if necessary, to a dusting process and to a preliminary boiling in alkali to cleanse it. The boiling process proper is carried out in large boilers usually of cylindrical rotary type, with alkali maintained at a temperature of about 145 deg. C. at 40 to 50 lb. per sq. in. pressure for several hours. The material, known at this stage as "half stuff," is then conveyed to a beating machine which may be of the open trough collander type or of the modern high-speed, closed, cylindrical

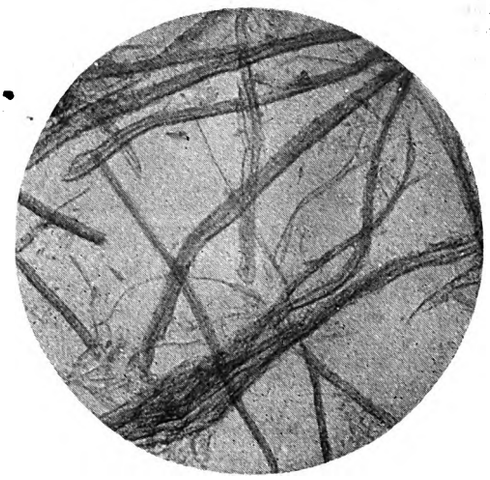

Fig. 2.—Microphotograph of jute fibres.

type similar to those shown in Fig. 4, invented by Mr. H. Jackson, of Garstang. The time of beating influences the length of the fibres, which are allowed to become more and more hydrated according to the nature of the paper desired. Figs. 1, 2 and 3 show micro-photographs of cotton, jute and chemical wood pulp fibres during the beating treatment. The Jackson process effects very complete disintegration and hydration of the fibres, and the resultant pulps produce high density papers of considerably improved electric strength.

The prepared pulp, or "stuff" is conveyed in a stream of water to travelling felts, on which it is carried to the cylinders of the paper-making machines, the surplus liquid being drawn off from the pulp by drainage and suction. At this stage precautions are taken by the introduction of "sand-traps" in the path over which the pulp passes, to eliminate any foreign particles which may have been introduced during the beating process. It is interesting to note, also, that means

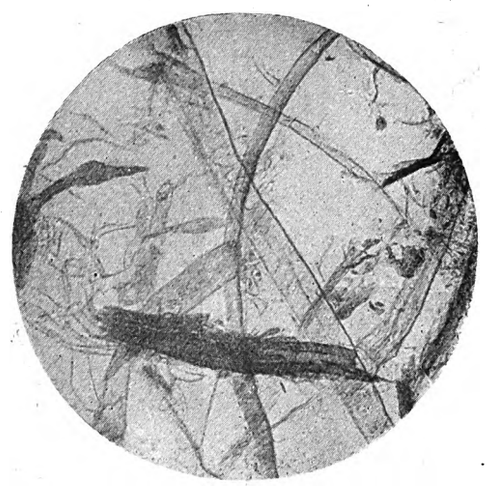

Fig. 3.—Microphotograph of chemical wood pulp fibres.

are used to shake the pulp transversely on the felts in order to cross the fibres; and so bind the structure somewhat on the principle of the ancient papyrus sheets. Notwithstanding this, the drawing action of the felts inevitably produces a lie or grain in the finished paper. This is indicated by tearing test results. Fig. 5 shows two specimens of the same material tested longitudinally and transversely according to the method suggested by the E.R.A., and it will be noted that in the tear

D

Digitized by Google

corresponding with the lie of the grain the torn tongue is considerably elongated.

For wood-pulp papers, known generally as krafts, sulphates and sulphites, the fibres are reduced either by a mechanical grinding process or by chemical disintegration with soda,

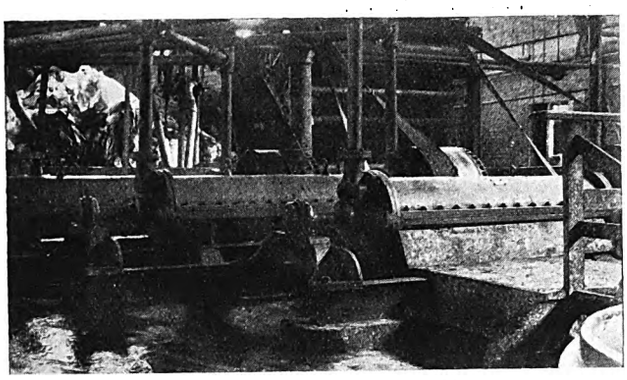

Fig. 4.—Jackson high speed beating machines.

sodium, sulphate or sodium sulphite. Most of the material used for wood-pulp paper making in this country is received from abroad in the state of cakes of half-stuff. Mechanical wood-pulp paper is unsuited for insulation purposes, owing to its very poor ageing qualities. Chemical wood-pulp papers can be successfully used for some electrical work, as the process lends itself to the elimination of impurities and gives a much more refined product.

For asbestos papers the fibres are mechanically torn from the natural substance, a small proportion of cotton pulp usually being added to give mechanical strength.

Papers which are required primarily for their insulating properties should only be made from either cotton, manilla or chemical wood pulp or a mixture thereof. There is a tendency at present to concentrate on chemical wood pulp papers owing to their advantage in price, but, as indicated later, where maintenance of mechanical properties under comparatively high temperatures is important, the use of a cotton base is essential.

Typical electrical breakdown values for various papers are given in Table I in order of electrical merit based on the electric strength in volts per mil. The tests, as is usual, were made between cylindrical electrodes of 3 in. and 1½ in. diameter in air at 90 deg. C. so as to eliminate the influence of moisture. It should be noted that the results shown are average values, and that better values are obtainable on special refined papers

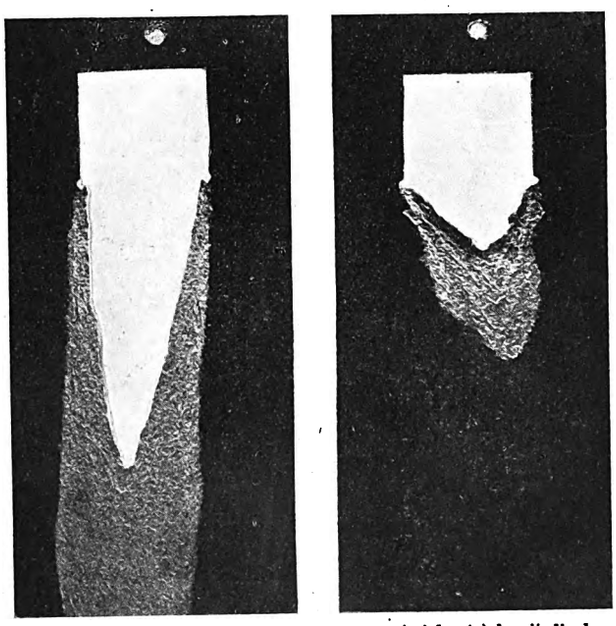

Fig. 5.—Tearing test specimens of same material: (a) longitudinal, (b) transverse.

of the various types. The actual breakdown values are, of course, given by multiplying the thickness by the volts per mil. The variation in electric strength with thickness is indicated by Fig. 6, which is reproduced from "Electrical Insulating Materials," by Monkhouse.

Fig. 7 shows the results of ageing tests on various papers, and indicates the superiority of cotton in this respect. Chemical wood pulp papers have, however, now been produced which are little, if at all, inferior to the manilla papers extensively used in cable manufacture. The curves indicate clearly that rapid deterioration of the materials commences about the temperature of 140 deg. C., and a similar indication with regard to wood pulp cable paper is given by test results published in the July 1929 serial report of the Underground Systems Committee of America, from which Fig. 8 is reproduced. The curves given in this report for lower temperatures show little deterioration, even over a period of twice the length of time.

Other qualities than electrical strength are often of importance in papers for electrical purposes. For instance, where the severe mechanical pressure of one conductor passing over another has to be resisted, a hard material such as pressboard or leatheroid is required, while, on the other hand, the manufacture of synthetic resin varnish laminated products calls for an absorbent paper, the degree of absorbency governing the quality of the finished product. Most electrical

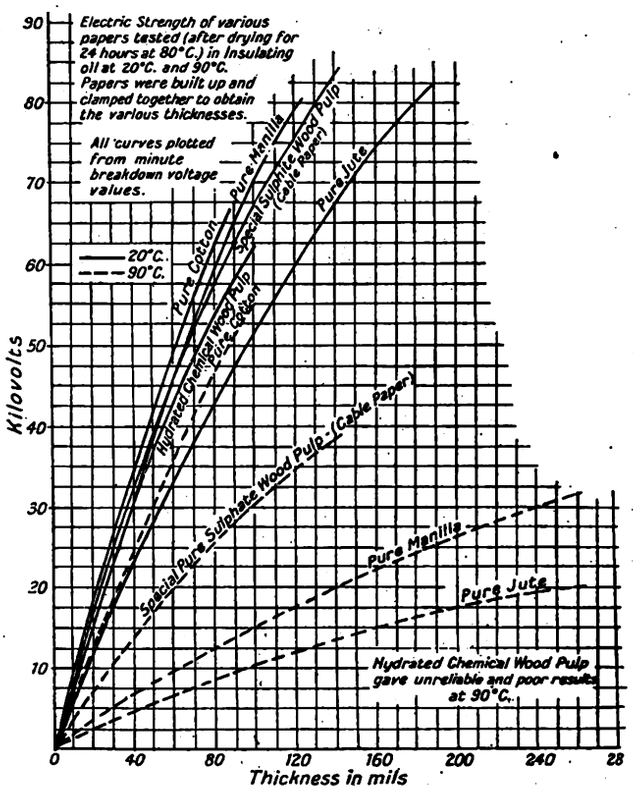

Fig. 6.—Electric strengths of papers showing variation with thickness.

manufacturers, therefore, utilise a number of preferred types of paper which they standardise for their own requirements. This very fact leads to difficulties in the standardisation of papers, but considerable assistance in the preparation of specifications is given by the recommendations on methods of test issued by the British Electrical Research Association.

The following notes indicate some of the features to be considered in selecting a paper for any specific purpose.

Thickness.—Thin papers are generally better made than thick, and have superior electric strength. Thin papers are necessary where thorough impregnation is desired in preference to the merely surface treatment obtained with thick papers. Similarly, thin papers, due to their higher varnish content when treated, make better quality varnished papers.

Density.—The density of a paper is closely related inversely to its porosity, and, directly to its electrical strength. Moderately dense papers have excellent mechanical properties, but with excessive density there is a tendency to brittleness which is increased when the materials are aged at high temperatures.

Tensile strength.—This feature is of particular importance where papers are required for ribbon applications such as the paper insulation of cables and conductors, or the strengthening of mica cell material for wrapping on the slot portions of coils. It is also of importance where it is necessary to varnish long lengths of papers, since low tensile strength

Digitized by Google

limits the permissible length of unsupported span, and therefore the choice of process.

Porosity.—The importance of porosity is chiefly in connection with paper which has to be impregnated, the more porous paper producing a material with a higher resin content, and therefore a higher electric strength and greater resistance to moisture.

Bursting strength.—The difference in bursting strength as measured by the Ashcroft tester before and after periods of heat treatment, is usually taken as an indication of ageing properties. This characteristic is more clearly indicated if the ageing is carried out at 160 deg. C. instead of the usually adopted temperature of 105 deg. C.

Tearing.—Tearing tests are often employed where it is desired to examine the length of fibres, as it is clear that longer fibres will present greater resistance to tearing. The results of a typical tearing test have been referred to (see Fig. 5).

Alkalinity or Acidity.—Good papers should be neutral.

TABLE I.—TYPICAL ELECTRIC STRENGTH VALUES OF VARIOUS PAPERS.

Thickness (inch)	Kind of Paper	Electric strength Minute value in air at 90 deg.C. volts/mil.	Electrical use.
0·0004	Flax condenser tissue	780	Condenser dielectric.
0·0005	Rag condenser tissue	580	Condenser dielectric.

0·015	Presspaper	154	Transformer coils, turn separators.
0·005	Cable	147	Power cables and bakelite boards and tubes.
0·015	Asbestos paper	125	Field coil turn insulation.
0·020	Asbestos paper	105	Field coil turn insulation.
0·025	Asbestos paper	95	Field coil turn insulation.

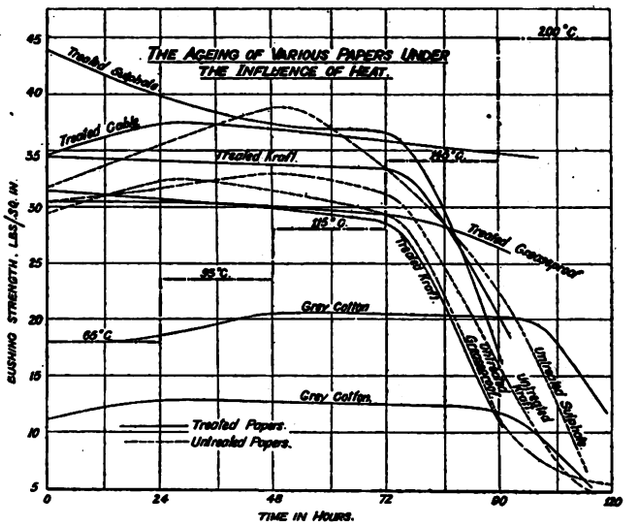

Fig. 7.—Results of ageing tests on various papers.

Any appreciable alkalinity or acidity reduces the electrical strength and accelerates deterioration.

Ash.—Good papers should have a low ash content, preferably not exceeding 0·7 or 0·8%, but this is governed to a large extent by the base from which the paper is made. It will be obvious that these figures will not hold for asbestos papers.

TABLE II.—INFLUENCE OF TREATMENT ON THE ELECTRIC STRENGTH OF PAPERS.

Thickness (inch)	Kind of Paper.	Treatment.	Electric strength minute values in air at 90 deg. C. Before. volts/mil.	After. volts/mil.
0·003	Kraft	Synthetic resin	140	247
0·003	,,	Shellac varnish	140	226
0·005	,,	Transformer oil	136	700
0·005	Cable	Shellac varnish	147	174
0·003	,,	Shellac varnish	210	247
0·005	,,	Transformer oil	163	1 700
0·002	Greaseproof	Shellac varnish	317	410
0·002	,,	Synthetic resin	317	488
0·004	,,	Transformer oil	275	1 400
0·003	,,	Transformer oil	317	2 000
0·015	Presspaper	Transformer oil	372	1 140
0·002	Cotton	Baking varnish	150	2 000

Electrical Strength.—The importance of electrical strength is probably greatest in the applications of high voltage cable

TABLE III.—TEST RESULTS ON TYPICAL PAPERS SUBMITTED FOR DEFINITE PURPOSES.

and conductor insulation, but this is largely governed by the process of impregnation adopted. High electric strength values are important for the paper insulation between layers of fine wire wound coils. The extent to which electric strength

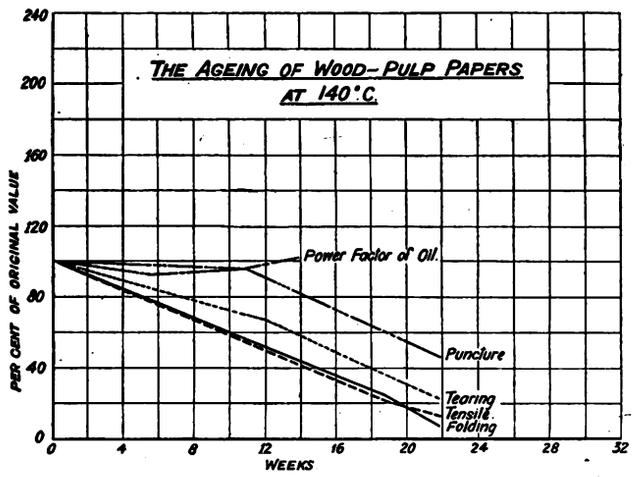

Fig. 8.—Results of ageing tests on chemical wood.

is influenced by subsequent treatment of the paper is shown by Table II, which gives typical results of tests with regard to this feature.

The values which should be obtained in tests on various properties are difficult to state in the absence of standard specifications, but the values given in Table III, showing the results of tests on typical papers submitted for various definite uses, may serve as an indication.

The authors' acknowledgments are due to Mr. H. Jackson for Fig. 4, to Sir Isaac Pitman and Co., Ltd., for Fig. 6, and to the Metropolitan-Vickers Electrical Co. for permission to use the other illustrations and information.

VITREOUS PRODUCTS.

The Properties and Applications of a New Insulating Medium.

INSULATION engineers will need no introduction to Mycalex, a comparatively new electrical insulating medium, which is regarded by some as representing one of the most revolutionary advances in applied electro-chemistry since the introduction of synthetic resins.

Mycalex is not a synthetic resin, but is a vitreous product composed of pure electrical mica (or other base) intimately associated with a vitreous flux resulting essentially in a new medium (not merely a new material) which is claimed to be perfectly stable and inert under all conditions likely to be met with in service.

Mechanical Strength.

It can be produced in sheets, rods or tubes, and can be extruded in any section, and moulded in conjunction with metal inserts. The finished product, although of the consistency of porcelain, can be drilled, tapped, sawn or machined in the lathe, and its mechanical strength is said to surpass that of any other insulating material.

Hitherto Mycalex has been manufactured in America and Germany under licence from the patentees. Now, however, it is to be produced in England, under the personal supervision of the inventor, Mr. P. B. Crossley, who has designed the special plant for that purpose. The works are at Harlesden, near Willesden, Middlesex, and the registered offices of the Mycalex (Parent) Co., Ltd. are at Abbey House, Westminster, where we understand that specimens of the product can be seen by those interested.

Noteworthy among the specimens inspected by a representative of THE ELECTRICIAN was a model high-tension stator-bar with the insulation moulded on, in intimate contact with the metal, leaving no air-spaces.

Mycalex can also be made in different grades to suit special requirements. These range from the ordinary grade, which is refractory at 450 deg. C. up to a special arc-resisting quality which is formed of an alternative base composition. The material can be produced in a variety of colours, and with glazed surfaces.

The following physical properties are claimed for the ordinary quality Mycalex (unglazed) :—

Dielectric Strength	24—15 kV/mm (according to thickness).
Volume Resistivity	80 x 106 megohms cm. cube.
Permittivity (" K ")	5 to 7.
Power Factor (tan.d.)	0.002 (0.2%).
Power Loss (K x tan.d.)	0.01 to 0.014 (1.0 to 1.4%).
Thermal Conductivity	23.8 Watts per cm. cube per °C.
Linear Expansion	0.00000881—25° to 50°
	0.00001140—150° to 175° C.
Specific Gravity	3.0 to 3.3.
Water Absorption	0.02% in 24 hours.
Plastic Yield with temperature. (Martens Test)	450° C.
Hardness Schleroscope	40.
Hardness Brinell	40 to 50.
Tensile Strength	5 to 6 tons per sq. in.
Bending Strength	10 to 12 tons per sq. in.
Resistance to Crushing	19 to 25 tons per sq. in.
Impact Notched	6 to 7 Kg. cm. sq. cm.
Impact Unnotched	6 to 7 Kg. cm. sq. cm.

From the above table it will be seen that the dielectric losses compare favourably with high grade ebonite, consequently Mycalex has an enormous field of application in high frequency work, either for panels (where its high mechanical strength enables the thickness to be appreciably reduced) or for strain insulators, where the material is either in tension or compression.

The high value of resistance to impact immediately suggests application in connection with track insulators for railways and also for insulators for telegraph, telephone and overhead power lines, which are subject to malicious, as well as accidental damage.

Resistance to Heat.

With regard to resistance to heat, Mycalex is claimed to be in a class by itself. In its ordinary form it is non-inflammable and fire-resistant, and is said to be unaffected by temperatures which would completely carbonise synthetic resin products; whilst in its most refractory form it is considered to be eminently suitable for arc-shields, spark-plug insulations and similar applications.

The Mycalex (Parent) Co. is considering applications of this medium in relation to all suitable insulation problems from the humble plug and socket for domestic installation to the more pretentious bushing for a 132 kV switch, or for transformer insulation.

Quantity production of the material is expected to commence in this country before the end of this year.

NON-FERROUS METALS.

Data on Employment in Manufacture of Washing Machines.

THE American Bureau of Metal Statistics has received reports respecting the use of non-ferrous metals in the manufacture of washing machines from companies that produced about 58% of the washing machines sold in 1928. From data furnished by these companies they estimate the total use of non-ferrous metals in the manufacture of washing machines, excluding that used in the electric motors, as follows, in tons of 2 000 lb. :—

	1926	1927	1928
Aluminium	10 200	8 800	9 200
Copper	5 000	3 800	4 200
Zinc	1 600	950	1 100

The above totals include the use of these metals alone or contained in alloys. The estimated actual use was as follows, in tons of 2 000 lbs. :—

	1926	1927	1928
Sheet copper	3 800	2 800	3 200
Sheet brass	800	400	500
Sheet zinc	1 100	600	700
Brass fittings	750	500	600
Bronze fittings	300	350	350
Aluminium	10 200	8 800	9 200

The American Washing Machine Manufacturers' Association report the sales of washing machines as follows :—

Sales	1926	1927	1928
Electric	843 685	775 661	820 430
Other	185 368	168 845	179 774
Total ..	1 029 053	944 506	1 000 204

DIELECTRIC STRUCTURE AND BEHAVIOUR.

A Brief Survey of Various Attempts to Define the Phenomenon of Dielectric Failure—The Use of Porcelain for Experimental Verification of Theory.

By J. K. GILLETT, M.Sc.(Tech.)

IF we apply to an insulator gradually increasing voltage, a conduction current will flow, which, so long as the intensity is low, increases roughly in proportion to the applied voltage —i.e., the resistance of the insulator is more or less constant. As soon as the intensity becomes appreciable, however, the resistance begins to decrease, and the current increases more rapidly than proportional to the voltage.

Further increase of voltage leads to a further decline in resistance, until, finally, a condition is reached at which the current continues to increase without further increase of voltage. The insulator may then be said to have broken down, and the voltage at which this occurs may be termed the breakdown voltage. If the voltage were to be maintained at this value the power dissipated in the insulator would increase with the current, and in a very short time the insulator would be destroyed by the resultant heat. It should be noted, however, that this destruction is an effect, and not the cause of the breakdown. The general shape of the current-voltage curve of an insulator is shown in Fig. 1. Such curves were first obtained experimentally by Dr. K. W. Wagner (1).

The breakdown of a dielectric may consequently be defined as the initiation of a condition of current instability produced by increasing the voltage applied to the dielectric above a certain critical value. Such a definition presupposes a mechanism by which instability occurs, but does not rest on any particular theory of failure. It is, however, important to discover why this instability occurs.

We may here remark that no really satisfactory explanation of the matter can be given at the present date, nor is it reasonable to expect that this should be done. Dielectric failure is essentially a phenomenon of instability in the molecular structure produced by external forces; since our knowledge of this structure is extremely meagre in the stable state, it is hardly to be expected that we should comprehend the mechanism of its disruption. As in most branches of physics, we here have to rest content with an explanation which describes the phenomenon in terms of more familiar concepts.

While a number of individuals had expressed opinions on the subject of dielectric breakdown in more or less vague phraseology prior to 1912, no coherent theory capable of examination had been suggested. In that year, however, Prof. Miles Walker, in discussing a paper by Dr. E. H. Rayner (2), developed an idea which had been fundamental to the majority of subsequent work on the subject, and which, when expressed quantitatively, suffices to explain satisfactorily at least one type of breakdown. Prof. Walker's idea (3) was briefly as follows:—

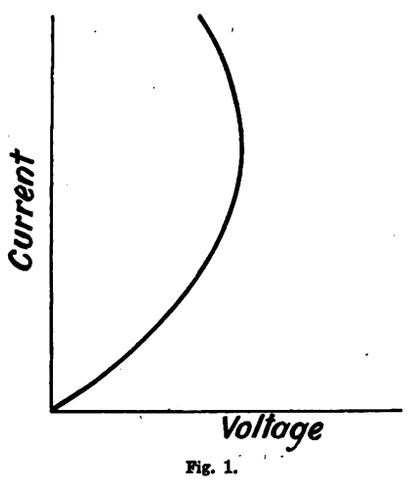

Fig. 1.

When a dielectric is under stress there occur in it dielectric losses—i.e., the conversion of electrical energy into heat. Although the magnitude of these losses is, in general, small when viewed from the standpoint of power engineering, yet the thermal conductivity of most insulation is also small, so that even these small losses produce an appreciable temperature rise in the dielectric. These dielectric losses, however, have the general property of increasing more or less rapidly with temperature. The slight elevation of temperature due to the initial loss leads, therefore, to an increase in the losses.

Higher losses lead to higher temperature, higher temperature again to still higher losses. The higher the temperature of the dielectric above its surroundings, however, the greater will be the amount of heat conducted away. It is, therefore, possible that a state of equilibrium will be attained at which the heat generated will just equal the heat dissipated, when no further temperature increase will occur.

It is, however, also possible that, due to the large increase of loss with temperature, a stable state will not occur, and the temperature of the dielectric will continue to rise until the material is destroyed by the excessive heat.

Prof. Walker's ideas, although exceedingly valuable, provide only a qualitative explanation of what happens when a dielectric breaks down, and one cannot be said to know very much about a phenomenon until it is possible to predict the conditions of its occurrence and calculate its magnitude. Prof. Walker's idea had to be expressed in a mathematical form, and this was first done by Dr. K. W. Wagner (1).

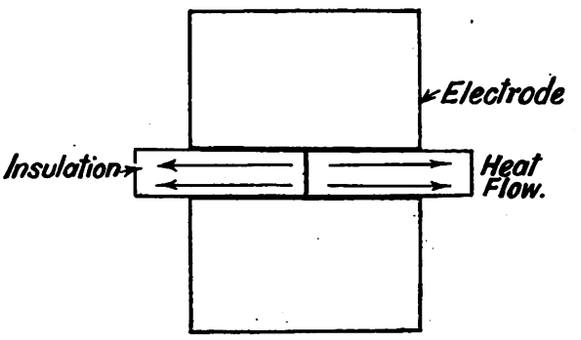

Fig. 2.

The Wagner Thread Theory.

The essence of the Wagner theory was the assumption of inhomogeneity in the dielectric—i.e., the existence of one or more localities in which the resistivity was lower (i.e., the losses higher) than the surrounding portions of the material. Wagner conceived these weak spots as filaments, or little cylinders, with the axes normal to the plane of the electrodes. The heat generated in the filament flows away into the surrounding dielectric entirely in a direction normal to the axis of the filament—i.e., parallel to the plane of the electrodes (Fig. 2).

The filament is, in fact, regarded in much the same way as the wire in a fuse. A certain number of watts per unit length per degree temperature rise can be dissipated into the surrounding medium, and heat conducted along the filament is neglected. When the rate of increase of loss with temperature becomes greater than the rate of heat dissipation with temperature, then instability of current occurs in the filament, and the temperature will continue to rise.

This fuse analogy at once indicates one of the weaknesses of Wagner's conception. It is well known that if a fuse is short the cooling effect of the terminals is appreciable, and similarly we may expect an appreciable flow of heat towards the electrodes unless the distance apart—i.e., the thickness of the dielectric, is considerable. In a thick slab of dielectric the likelihood of finding a weak thread or filament running all the way between its surfaces is exceedingly remote, so that the assumption does not correspond with fact.

Again, considering the variation of the breakdown voltage with the thickness of the dielectric, on the above assumption we deduce that the breakdown voltage should vary directly with the thickness—a result at variance with the majority of experimental data. Wagner's theory is also incapable of explaining the influence of the thermal conductivity of the electrodes on the result. Rayner and others have made tests, using electrodes of good and poor thermal conductivity, and found that in the latter case the breakdown voltage was invariably lower. This can only be due to the fact that heat conduction to the electrode does occur, and when the thermal conduction of the electrodes is poor, less heat is so abstracted, causing a higher temperature rise for a given loss.

Finally, it is obvious that matters must depend considerably upon the degree of inhomogeneity assumed. If this is only slight the material in the neighbourhood of the thread will also be warmed up, and in any case this must occur after the voltage has been applied for any length of time, since the heat from the thread must be conducted away, and we cannot postulate the existence of a sudden temperature change at the surface of the filament.

Digitized by Google

It is when we come to consider what happens when the filament is gradually merged into its surroundings that it becomes obvious that a theory of thermal instability for an entirely homogeneous dielectric must be established before the effects of inhomogeneous media are considered.

The problem to be solved is essentially one of heat conduction, and was first attacked on a general basis by W.

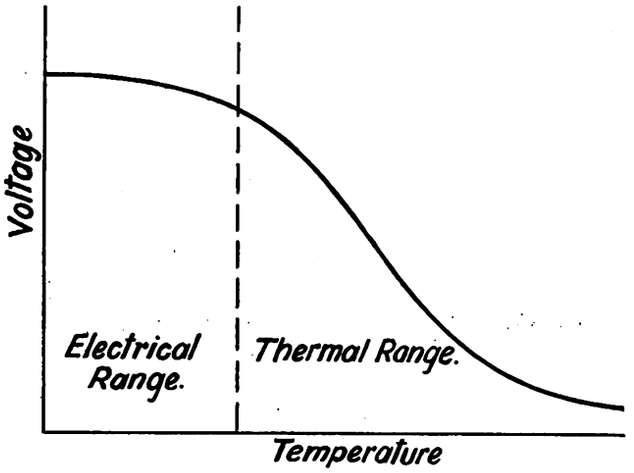

Fig. 3.

Rogowski (4), but the subsequent work of L. Dreyfus (5) and V. Fock (6) is somewhat clearer, and more rigorous. All these writers were compelled to restrict the analysis to the one dimensional case by the mathematical difficulties of the problem, but Dreyfus and Fock obtained general solutions for an arbitrary loss function, and, for a particular loss function, discussed a number of cases of practical importance. In particular, the relation between the breakdown voltage, thickness, and temperature of a plate of insulating material was discussed, and formulæ deduced for the calculation of the breakdown voltage from a knowledge of the thermal constants, thickness, and loss function of the dielectric.

The publication of this work at once gave rise to attempts to obtain experimental verification of the conclusions deduced. The most complete and thorough investigation of the matter was that carried out by the colleague of Prof. Fock at the Physico-Technical Laboratory in Leningrad.

In a series of papers (7) and (8) these investigators demonstrated that the phenomena and mechanisms of the breakdown of solid dielectrics are essentially different, according as the temperature is high or low.

Characteristic Phenomena.

The general shape of the breakdown voltage-temperature curve is indicated in Fig. 3, and can be divided essentially into two parts. First there is the low temperature or "electrical" range. The characteristic phenomena accompanying failure in this range are the considerable dependence of the breakdown voltage on the maximum intensity and form of the electrostatic field, the small influence of temperature and time on the breakdown voltage, and the practical independence of breakdown voltage and volume resistivity. Secondly, there is the high temperature or thermal range. Here the characteristic peculiarities are the great influence of the thermal conditions upon the breakdown voltage and the dependence of the breakdown voltage upon temperature, time, and volume resistivity.

It may be taken as pretty well established that, within the high temperature range, failure of solid dielectrics occurs by thermal instability, and the thermal theory of Dreyfus and Fock provides a satisfactory quantitative explanation of the matter. It is, however, equally well-established that this theory does not serve to explain the phenomena observed within the low temperature or electrical range, for which some other explanation must, therefore, be sought. Realisation of this fact imparted a further impulse to the investigation, and a number of theories of electrical failure, (9), (10), (11), have been put forward, only one of which will be considered here.

Horowitz (12), an investigator of the Leningrad circle, considered mathematically the stability of a small cavity in an electrically stressed medium. The elongation of such a cavity in the direction of the field tends to decrease the potential energy of the system, and there is consequently a force tending to produce such an elongation whenever an electrical field is applied. This force is opposed by (*a*) the surface tension and (*b*) the elastic force of the material.

It can be shown that when the intensity of the electric field exceeds a certain value the equilibrium becomes unstable and the crevice tends to extend itself. Calculations of this theory give results of the correct order of magnitude, the discrepancies being probably due to the impossibility of estimating with certainty the dimensions of the initial cavity.

A Remarkable Fact.

It is a somewhat remarkable fact that the discrepancy between the molecular and the technical strength of materials, both in the mechanical and the electrical sense, can be explained by an appeal to the microstructure. It is, therefore, of interest to inquire what further influence the structure may exert upon the electrical properties of a material.

In considering the structure of substances we classify them as homogeneous and heterogeneous, amorphous and crystalline, isotropic and anisotropic. The general type of a heterogeneous material is indicated in Fig. 4a; in a matrix of one material are interspersed particles of another. On traversing any line AB through the body, the physical or chemical property which we are considering changes in an irregular manner, as shown by the curve. According as this variation is large or small, well or poorly defined, so the body is the more or less heterogeneous in nature.

Heterogeneous media must be further subdivided according as to whether the magnitude of the property considered is or is not related to some particular direction in the body. In many crystals, for example, the electrical properties are different along the various axes. The structure of such anisotropic bodies is suggested in Fig. 4b.

Technically, the only important representatives of the anisotropic class in dielectrics are the laminated materials of the resin-paper type now so widely used; otherwise the insulating materials of technics can be considered as isotropic, except where the dimensions of the region considered are comparable with those of the dispersed particles.

In considering heterogeneous bodies we have to take into account both the composition and microstructure.

There can be no possible doubt that the size, shape and nature of any contained particles will have a considerable influence upon the stresses set up. For example, mathematical analyses indicate that if we place in a uniform field an extremely small sphere of dielectric constant ε, the intensity of the field in the neighbourhood of the sphere will be increased to $\frac{3\varepsilon}{\varepsilon+2}$ times its initial value. If the included particle is not spherical but ellipsoidal, the increase in the intensity will be still greater; it is obvious that very high intensities will be produced if the particle is angular and sharp.

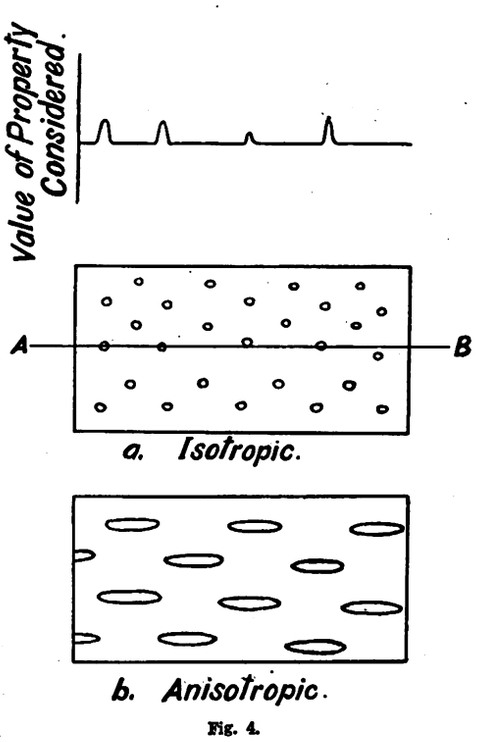

Fig. 4.

Again, if the included particles are dispersed in an irregular manner throughout the mass so that some of the particles are entirely isolated, we may expect much higher stresses than where the particles are all of the same size and shape, and are distributed uniformly throughout the mass.

These considerations suggest that a body of fine microstructure is better suited to resist electrical and mechanical stresses than one of coarse structure; the more homogeneous a material is the better it should behave.

A dielectric in everyday use was therefore selected for the experimental verification of the foregoing theory, and since porcelain was found to be peculiarly suitable this material was subjected to various mechanical and electrical tests. How far the actual test results confirm the expectation arrived at by a study of the microstructure will be shown in a later article dealing with the characteristics of porcelains.

THERMO-ELECTRIC TESTS FOR ALUMINIUM-MANGANESE AND OTHER ALLOYS.*

By CYRIL S. TAYLOR and JUNIUS D. EDWARDS.

THE need frequently arises for rapid physical tests for identifying certain metals and alloys. For example, an aluminium manganese alloy, containing about 1% manganese and known as 3S, is rolled in large quantities in the same mills with commercially pure aluminium. Occasionally the question arises as to the identity of a given lot of metal, and, if chemical analysis must be resorted to, some time must elapse before the answer is available. Likewise it is frequently desirable to make certain identification without damaging or destroying the sample or article.

In an investigation of the effect of impurities on the thermo-electric properties of aluminium, it was discovered that manganese, among the alloying elements commonly used with aluminium, was outstanding in its effect upon the thermo-electric properties of the metal. For example, aluminium alloys with copper, iron and silicon, in amounts even up to several per cent., show a thermo-electric force against pure aluminium at the melting point of less than 50 μV. On the other hand, about 1% manganese alloyed with aluminium will show a thermal e.m.f. of over 300 μV under the same conditions.

This high thermo-electric potential of the couple aluminium *vs.* aluminium-manganese alloy seemed to offer a ready and rapid means of distinguishing between these two materials. Accordingly an apparatus suitable for plant or laboratory was constructed for carrying out this test. An ordinary electric soldering iron, slightly modified, is used as a heating device; one with a removable soldering copper is used. A length of 99·4% aluminium wire is welded on to a suitable sized rod of the same purity aluminium, and this rod is then threaded tightly upon the projecting end of the soldering copper. The other end of the aluminium wire is attached to one terminal of a sturdy but sensitive portable galvanometer.

The aluminium rod and wire constitute one member of a thermocouple; the other member of the thermocouple consists of the specimen which is to be measured. The specimen is connected by means of a clip and wire to the remaining terminal of the galvanometer. An alternative method is to connect a large sheet of aluminium by means of a wire to the remaining terminal of the galvanometer. The specimen under test (test piece) is placed upon the sheet and thus becomes automatically connected to the galvanometer. This arrangement is illustrated in Fig. 1.

To make a test, the heated aluminium rod (soldering iron) is touched to the specimen, and the galvanometer watched for a deflection. If there is no deflection, the metal is pure aluminium; if there is a substantial deflection, the metal is the alloy 3S. As the point will not be at a constant definite temperature, it will be found useful in applying this method to have available for test, sample products of known composition, so that the galvanometer deflections can be compared between known and unknown samples under identical conditions of heating of the thermo-electric point. In the case of aluminium and 3S alloy, thermal e.m.f. developed is so large as not to require temperature control of the heated point.

Only a very small deflection is given by the alloys 17S and 25S, although each contains about 0·5% manganese in addition to 4 to 5% copper. The structural combination of the manganese with the other elements in these alloys is apparently such as not to affect the thermo-electric properties of the metal to anywhere near the same extent as is the case with manganese in the alloy 3S. It was found that magnesium base alloys containing aluminium also gave relatively large deflections when tested thermo-electrically with this apparatus against pure magnesium; the deflection was roughly proportional to the percentage of aluminium in the alloy. No doubt this apparatus could be usefully applied in the case of metals and alloys other than aluminium and magnesium.

THE PRODUCTION AND USES OF BERYLLIUM.*

Some of its Possibilities for Employment for Electrical Purposes—Improved Properties of Alloys after Heat Treatment.

By KURT ILLIG (of the Research Laboratories of the Siemens-Halske A.-G., Berlin).

THE year 1928 marked the centenary of the first production of beryllium by the celebrated German investigator, Wohler. During these hundred years almost all of the alkali and alkaline earth metals such as Li, Na, K, Ca, Mg, Ba, and Sr, have been prepared from fused electrolytes in commercial quantities. In the case of beryllium alone did all of the investigators fail, until recently, to prepare this metal in such quantities as to permit a study of its properties and uses. The difficulty which stands in the way of easy isolation of beryllium is its great affinity for oxygen. Before dealing with the modern methods of production, a brief résumé of the history of this interesting metal may be worth while.

EXAMINING RAW RUBBER.

RUBBER, an important raw material of the cable making industry, is here seen undergoing preliminary sorting and examination at the Helsby Works of British Insulated Cables Ltd. The rubber is carefully examined for impurities, and every piece is beaten and hand picked, dirty edges of sheets being cut off and put aside for washing. After blending the material goes to rubber mixers, the finished slabs passing thence to calendering machines where they are reduced to fine rubber sheets of thicknesses down to 0·006 in. The finished sheet is cut into tapes of from 4 in. to ½ in. wide and visually examined. It is then ready for application to the stranded wires.

Beryllium was discovered in 1798 by Vauquelin in the mineral "beryl," which had been known since antiquity. The ordinary beryl, an aluminium-beryllium double silicate, having the empirical formula $3BeO$, Al_2O_3, $6SiO_2$, has been comparatively unknown; the more valuable varieties of this mineral, the green emerald and the blue-green to pale blue or light rose coloured aquamarine, were known in pre-biblical times.

Other minerals are known to contain more or less beryllium, as for example, chrysoberyl, also named alexandrite $(AlO_2)_2Be$: phenacite Be_2SiO_4, which has a rather wide occurrence, and certain rare earth minerals, such as, euclase, gadolinite, helvinite, danalite, bertrandite, leucophane, melinophane—all of which are fundamentally silicates of beryllium, which differ from one another simply by the presence of silicates of other metals. A borate of beryllium, hambergite, and two phosphates, beryllonite and herderite, might also be mentioned.

Work of Stock and Goldschmidt.

The work which was decisive in the development of beryllium manufacture was accomplished by the German investigators, Stock and Goldschmidt, with the co-operation of Priess and Praetorius. They obtained metallic beryllium for the first time in the form of large reguli, directly from a fused electrolyte.

Investigations have shown that the most desirable conditions are fulfilled in general by the double fluorides of beryllium with sodium and barium. The barium-beryllium fluoride has an appreciable viscosity around 1 300 deg. C., but also has the advantage of being only slightly volatile at this temperature range; it has an appreciable dissociation within this range. The sodium-beryllium fluoride is strongly dissociated even at relatively low temperatures. This, therefore, offers a means of obtaining an electrolyte possessing a good conductivity. It has only one disadvantage, namely, that at very high temperatures the separated beryllium metal may be volatilised in appreciable quantities.

If the electrolysis is started with the sodium-beryllium fluoride and with rising temperatures some barium-beryllium fluoride is added in increasing amounts, there is obtained a useful mixture of the double salts for every temperature interval. When the final metal separating temperature of 1 300-1 350 deg. C. is reached, it is not difficult to continue the electrolysis for many hours, provided suitable additions of both double salts are made from time to time.

Stock and Goldschmidt protected this general method of procedure by letters patent in all large countries. They realised, however, that much additional work was necessary, before all of the details for the continuous production of large quantities of beryllium would be established. In order to study the problems on the broadest basis, the foremost German manufacturers organised a Beryllium Research Institute in 1923, under the chairmanship of the Siemens and Halske A.-G., of Berlin. It was the aim of this institute to make a systematic study of the fundamental Stock-Goldschmidt method in all its details, and to determine whether or not it was possible to produce beryllium metal in commercial quantities from fused electrolytes. The numerous variables which had to be considered made the work tedious, especially so since the temperature range of 1 300-1 350 deg. C. had never been used previously in fused electrolytic work. Some of the details of these investigations of the institute to date are herewith recorded.

Crucible and Electrode Materials.

The question of crucible and of electrode materials had to be settled first. In the early experiments of Stock and Goldschmidt, a crucible made of graphite was used as the anode. Graphite containing as little iron as possible is the only material to use. Acheson graphite is the best. The difficulties encountered in mounting the electrodes of the crucible were soon overcome. Various metals were tried as cathode; the most satisfactory was a special iron, made up into a hollow water-cooled electrode. The electrolysing current is sufficient to maintain the bath at the temperature required. At the start of the process the crucible is filled with pieces of carbon or graphite, the iron carbide is pressed firmly against these pieces, and as soon as the proper temperature is reached the pieces are quickly dumped out of the crucible and a charge of low melting sodium-beryllium fluoride is immediately put in. Then barium-beryllium fluoride is added until the required temperature range is reached for the electrolysis to begin.

Only after a large number of experiments were made was the best method for charging the crucible discovered, which method must be rigidly adhered to. Naturally there will be a relatively large burning loss of the graphite crucible, which, however, may be minimised by surrounding the crucible with another crucible packed with kryptol, to prevent contact between the very hot external wall of the graphite crucible and the air. Another method is to coat the external wall of the graphite crucible with a fused mass of the electrolyte, making an impervious coating, which is in no way objectionable since no impurities will be introduced into the electrolyte.

At first, relatively small reguli, of several grams only, could be separated from a single charge, and it was an exciting moment when several reguli of about 20 grams each were obtained. These reguli were still contaminated with the melt, and so were not fit for a scientific or technical investigation. Systematic and progressive development made it possible to obtain a single button of about 50 grams in weight, and at the same time containing only spots of very small amounts of impurities. It was this material that the several laboratories connected with the Beryllium Institute, as well as others not so connected, investigated. They determined the physical properties of beryllium metal.

Hand in hand with the scientific investigations on fused electrolytes went the determination of authentic methods

* Paper presented to the American Electrochemical Society.

Digitized by Google

of analysis. The previous methods recorded in the literature were either too incomplete or entirely too circumstantial to be of undisputed value for rapid work. Very good methods are now available for the rapid determination of beryllium in the presence of aluminium and other metals. In 1926 the Institute felt convinced that in the Stock-Goldschmidt method there was a means by which a commercial production of beryllium metal might be expected. At the same time the commercial applications of this metal were studied.

Commercial Investigations.

On the grounds of the results of the investigations of the Institute during 1926, the Siemens-Halske A.-G. decided to make a systematic study of the applications to a commercial scale. The previous work had shown that the best scientific and technical production of beryllium would be possible only if the salts used were cheaply prepared; especially if they were not hygroscopic, such as the double fluorides. The preparing of the salt from the crude mineral beryl was next investigated. Both of these problems have been solved in the past two years. Simply and cheaply prepared salts, such as the double fluorides, which also give good material yields, are being investigated now.

In the older methods the electrolyte became more and more enriched in barium fluoride, thus shortening the time of a single charge, but with the advent of the new salts it is now possible to make the process continuous and without interruption. Practically speaking, this continuous method is now limited only by the burning of the graphite crucible.

The beryllium metal is in convenient reguli of about 150 grams, varying with the size of the apparatus, and is about 98 per cent. pure. By special methods of remelting the purity can be increased to 99.9 per cent., though the yields of this very pure material are small. The main impurity of our beryllium is iron, which is introduced from the graphite crucible. The recently developed double decomposition methods of the raw beryl for the formation of the electrolyte salts produce about 65 per cent. of beryllium, calculated as metal, so that starting from the mineral the final yield of beryllium metal is about 60 per cent.

While this work was going on, investigations were being made as to the location and size of the beryl deposits in the various parts of the world, and as to the prices at which the material was marketed. This analysis showed that as usual when the possibilities of a new use for a raw material bring it to the attention of the world, it is found in many places. Norway, Spain and especially Florida, Canada and Brazil, in the order of importance, have large deposits of beryl. There appear to be deposits larger than previously realised in south Germany, and in the Ural mountains.

It may be safely predicted that in the near future many beryl, deposits will be found because now for the first time mineralogists and geologists have a stimulus for looking for this mineral. The prices for the crude beryl are exceedingly high at present, probably because there is no direct market for the material, but more probably because the owner of a beryl mine has the false impression that he has a mineral classed as a semi-precious stone. The owner must be enlightened as to the actual facts.

The most promising field which has so far been recorded in the literature is in the use of beryllium as a light metal. But the first studies of the metallographic division of Siemens-Halske have indicated that such a use is rather remote at present. Pure beryllium is an extremely hard and brittle metal, which scratches glass and can neither be rolled nor drawn because of its coarse crystal structure. Nevertheless plates of about 1 to 2 mm. by 10 to 20 mm. have been made from pure beryllium by special methods for use in X-ray work. But this is no application for which large amounts of metal need be produced.

Alloying with Aluminium.

Since beryllium has a specific gravity of 1·8 it has been considered advisable to try to alloy it with sufficient aluminium to make it workable. In this respect many interesting results may certainly be expected. It was not in the programme of Siemens-Halske to make a systematic investigation in this direction, because the realisation of our ambition to apply beryllium to arts and industry seemed only possible if beryllium alloys were developed which would compete with other alloys.

It has been shown that the addition of 2 to 2·5 per cent. of beryllium to copper or nickel produced alloys possessing properties like those of the bronzes, a fact previously unknown. In the case of additions of beryllium to aluminium the alloy showed properties somewhat like those of duralumin and silumin, though there is no advantage in favour of the beryllium-aluminium alloy. The more expensive beryllium cannot compete with silicon, magnesium, and copper in making alloys with aluminium.

Some important data on beryllium-copper and beryllium-nickel alloys might be noted. Alloys of cobalt with beryllium are very similar, but the silver-beryllium alloys have interesting properties which could not have been determined previously. In the study of beryllium-iron alloys the work has not progressed far enough to permit definite conclusions.

The most outstanding property of the beryllium alloys is in their improvement upon heat treatment. A copper-beryllium alloy containing 2·39 per cent. of beryllium, after ordinary quenching, has a Brinell hardness of 100 kg./sq. mm., but after heat treatment for 17 hours at 300 deg. C. this rises to 440 kg./sq. mm. that is, to over 400 per cent. Some copper alloys containing over 6 per cent. beryllium have a hardness of over 730 Brinell numbers. These alloys cannot be worked in the untreated condition. Bronze-like properties are developed in these copper alloys, which, in the untreated condition, can be rolled, drawn or worked to the desired shape and then by heat treatment can be hardened and roughened. It is possible to make thin elastic pieces. The following information on the strength of these alloys may be of interest.

In the untreated quenched state a copper alloy containing 2·5 per cent. of beryllium has a tensile strength of 48·9 kg./sq. mm., but after heat treatment it is 135 kg./sq. mm. The differences in the transverse bending strength are most astonishing; in the untreated condition, but quenched, it is 60·7 kg./sq. mm., but after heat treatment it rises to 216·7 kg./sq. mm. In the same alloys the yield point changes from 15·7 to 128 kg./sq. mm. on heat treatment, while the elastic limit in the first case is 5 kg./sq. mm., and in the second it is 45·9 kg./sq. mm.

As the beryllium content of these copper alloys is increased the final values for these mechanical properties in the treated conditions are also increased. There is, however, a limit which is 6 to 7 per cent. Be in copper and nickel alloys In general it may be said that the quenched alloys are very elastic and strong.

Heat treatment increases the elastic limit, and the yield point by about 800 per cent., while the tensile strength and the transverse bending strength increase about 3 to 4 fold. The ductility decreases proportionally with strength. This is not detrimental, since the shaping and working after quenching is done before it is given the heat treatment, so that ductility requirements need not be considered after the treatment. These alloys may be successfully rolled, drawn, and pressed.

Electrical Conductivity.

It is worth noting that the electrical conductivity of these alloys is lowered rather appreciably by the addition of beryllium. Alloys of 2·5 per cent. of beryllium, after quenching at 800 deg.C., have an electrical conductivity of 9·8 recip. ohms/sq. mm., of cross section. Heat treatment changes this conductivity to 19 recip. ohms/sq. mm., and after annealing followed by a second hardening it reaches 21·5 recip. ohms/sq. mm. These alloys are more resistant to corrosion than the ordinary bronzes.

Beryllium has an interesting application as a deoxidiser in copper casting. It has been shown that the addition of 0·02 to 0·05 per cent. of beryllium to copper for casting changes the electrical conductivity of the casting from 35 to 50 recip. ohms/sq. mm. The various alloys and their applications have been protected by letters patent.

NEW COPPER REFINERY.

It is understood that 250 men are now engaged on the excavation work in connection with the erection of the custom copper refining plant being built by the Ontario Refining Co. at Copper Cliff, Ontario, at an estimated cost of £1 000 000. The number of employees will be brought up to 600 when work begins on the erection of the steel structure, and it is anticipated that the entire plant will be in operation by January, 1931.

The new plant is being erected on a 40-acre site, there being three main buildings, namely an electrolytic cell house and two casting buildings, one for crude copper and the other for refined copper. The cell house will be roughly 300 by 400 ft., and will have 1 200 reinforced concrete cells with lead linings. The casting buildings will be 200 by 400 ft.

ELECTRIC WELDING.

Growing Applications in Electrical Manufacturing Processes.

IN view of the severe criticisms of certain applications of welding made in the recent annual report to the British Engine, Boiler and Electrical Insurance Co.'s special interest attaches to the "Impressions of American Industries, including Welding," which Mr. E. A. Atkins gave in a lecture to the Institution of Welding Engineers at Caxton Hall, Westminster, on October 3rd.

Mr. Atkins said that although prior to the war welding practice had been very much more advanced in the United Kingdom than in the United States, America had since jumped ahead in an extraordinary manner so far as welding operations were concerned.

Transformer Castings.

Among the works visited were those of the General Electric Co. at Pittsfield, where 7 000 people were employed, and he had been surprised by the extent to which welding processes were carried out there. The lugs of transformer casings, for instance, were not bolted and riveted on, but were welded on *en bloc* by an automatic system of welding, the casings being slung over a large bar or beam during the welding operation. Many methods of automatic welding had been developed.

In the welding of sheet metal for steel tubing by the carbon arc method, the filling material was laid right along between the two edges of the sheet, and the carbon arc travelled along and fused it in. Spot welding was used very commonly for all kinds of small joints, sheet metal work, and so on.

The multiple flame method of welding, which was used for welding sheet metal, was new to him. Two, four or more tips could be used; one tip of each pair of tips was above the sheet and the other below. The flames were regulated, and the sheet metal was mounted on a machine and passed through the flames at a speed which was regulated in accordance with the gauge of the sheet, the process being made either semi or completely automatic.

Welding was used extensively for very many purposes, and the lecturer illustrated its application to the repairing of various articles, such as wheels, brake shoes, etc., and the construction of other articles, including reels, which were made by welding together ribs of sheet or plate metal. His own experience of the use of such reels had proved that they were very strong, and appeared to be almost everlasting. Welding was also applied extensively in road construction, for welding reinforcing wire into panels and for jointing pipes.

It appeared that there was a big future for welding in structural work, and Mr. Atkins illustrated a number of buildings in the construction of which welding had been used extensively. The height of one building had been increased from 8 to 15 storeys, and, as it was obvious that the stanchions used for the original building were too weak to carry the load of the additional storeys, they were strengthened by the addition of stiffening ribs by means of electric welding.

Welding was also applied to steel structures to reduce corrosion. One of the disadvantages of rivets or bolts was that corrosion occurred much more rapidly at the riveted or bolted joints than at other parts of the structures, because the water lodged there, and welding was resorted to for filling up the corroded portions.

A type of welding which Mr. Atkins believed to be the latest on record was the atomic hydrogen method. This was in operation at the General Electric Co.'s works. The source of heat was an electric arc; hydrogen was blown on to the outsides of the arc, usually by two tips, the result being the production of an absolutely non-oxidising arc or zone. It was claimed that it gave a wonderful deposit, and he could confirm that, for never had he seen such a pure deposit of metal as that which he had seen deposited by this method.

Welding Refrigerator Parts.

The General Electric Co. used it for welding together refrigerator parts, but he was not prepared to say whether or not it would find an extensive commercial use, because it was more expensive than the ordinary electric arc or oxy-acetylene methods. It might be that somebody would develop some other method of surrounding the arc to keep the oxygen away. The weld could be bent like a piece of lead, and when examined under the microscope it was found to be solid, consisting of almost pure iron, free from slag or any oxide inclusion.

Speaking generally, he said, there was not very much advance in America with regard to welding methods, other than in the direction of the atomic hydrogen method, and there was no doubt that the Americans were going ahead with that. He had been impressed, however, with the manner in which the Americans tackled things in bulk. At the Pittsfield works of the General Electric Co. he was told that they had been very dubious about the adoption of welding for a long time, but as soon as they had found it could be done properly it had been used very extensively.

Many welding machines were coming into common use, with a view to cheapening production, and there seemed to be very little opposition on the part of the workers to the introduction of machines.

Photographs were shown of the applications of welding on the South American oilfields, where the oil tanks were welded structures. Welding was applied there also to the jointing of pipes, the repair of various pieces of machinery, etc. The automatic welding process was carried out quite well by native welders.

Replying to a question as to the types of electrode used generally in America, Mr. Atkins said the Americans liked bare electrodes, but in some cases they used flux-coated, and in others lagged electrodes. It all depended on the conditions and the class of joint required. The General Electric Co. used the atomic hydrogen welding method to get the tightest possible joint. In many cases the electrodes used in America appeared to be thinly coated.

ESTIMATING IRON IN CHROMIUM ALLOYS.

THE use of alloys containing iron and chromium, and often also nickel, is at the present time becoming very widespread in engineering, and therefore the following details (supplied by a correspondent) may be of interest to those engaged in the analysis of these alloys. The usual method of separation of iron from chromium is by means of sodium peroxide, but the author has found that the following method gives quite accurate and reliable results on this class of material. The method is based on the oxidation of the chromium by ammonium persulphate and then precipitation of the iron as usual with ammonia. The estimation is carried out as follows:—

From one to three grams of sample is taken (depending on the amount of iron suspected) and dissolved in dilute sulphuric acid if possible. If, however, the alloy is not completely soluble in sulphuric acid, then hydrochloric acid or aqua regia must be used to dissolve it, and then sulphuric acid must be added and the solution evaporated until white fumes are evolved. The solution is then diluted with hot water and boiled. If any silicon is precipitated at this stage it should be filtered off. The solution is now cooled, diluted to 250 ccs., and a measured quantity taken so as to give approximately 0·1 to 0·2 g. of iron in the estimation (a larger quantity may be difficult to filter). This is then made up to about 150 c.c. bulk, about 2 g. of ammonium persulphate crystals added, and the whole boiled for about a quarter of an hour. All the chromium in the alloy will now be oxidised, and any manganese will be precipitated as manganese dioxide, which should be filtered off. Ammonium chloride and ammonium hydrate are now added to the solution to precipitate the iron, which is filtered off, after boiling, and ignited and weighed as ferric oxide as usual. The percentage of iron is then calculated from the weight of sample taken as usual.

The resulting filtrate may sometimes be used for the estimation of nickel in the alloy by the dimethylglyoxime process, but here the estimator must use his discretion, as this depends on the amount of nickel present in the alloy.

ALUMINIUM FACTS AND FIGURES.

A further series of data sheets for inclusion in their handbook, "Aluminium Facts and Figures," has been issued by the British Aluminium Co. A.73 and A.74 show enlarged tables of the properties of stranded aluminium and steel-cored aluminium conductors, revised in conjunction with the British Engineering Standards Association. A.166 is a new data sheet on expanded aluminium sheets. The metal in this form makes up into economical framing, backgrounds and screening, and a variety of light structural uses.

COMMERCIAL SHORT WAVE WIRELESS COMMUNICATION.

Solution of Propagation Problems—Operating Technique of the Network Outlined—The Monitoring System—World-wide Interconnection.

A LECTURE on "Commercial Short Wave Communication," illustrated with lantern slides and diagrams, was given by Mr. H. M. Dowsett, before the annual convention of the Radio Society of Great Britain at the Institution of Electrical Engineers, Savoy Place, London, on September 27th.

The lecture had a topical interest owing to the fact that a few days later wireless telegraph services formerly administered by the Post Office and the Marconi Co. came under the control of Imperial and International Communications, Ltd.

Mr. Dowsett's lecture was concerned with the manner in which those responsible for commercial wireless have applied the knowledge gained during the last few years to the solution of short wave propagation problems, and of the operating technique which has gradually been built up so that wireless traffic services are well established on an economic and satisfactory basis between this country and all parts of the earth.

Mr. Dowsett first spoke of the "Empiradio" services which, he said, provided the most striking example of successful commercial short wave working in the world, and were the outcome of the researches of Mr. Marconi and his assistants on short wave directional wireless from 1915 onwards.

The transmitter used for these services, he said, was of a design which gave great stability of wavelength, and, with 20 kW to the anode of the first magnifier, provided more than enough power for high speed working. The receiver was designed for strong signals, and these signals were not mutilated by short fade periods. It was three years since the first Imperial Beam service was opened to the public. In this period several types of projector aerial had been evolved and employed for commercial working in different parts of the world, but nowhere could they find a concentration of beam radiation equal to that provided at an Empiradio station.

Numberless short wave transmitters could be heard on the ether, many of them crystal controlled, but a careful watch disclosed that the Empiradio transmitter had a constancy of wavelength equal to the best of them, and that it was handling more traffic, and continuing in service without "sticks" for more hours than any other type of transmitter. These were some of the facts which helped to explain the astonishing commercial success of the Empiradio services.

Features of Beam Equipment.

Mr. Dowsett proceeded to describe some of the distinctive features of the Empiradio beam equipment, and said stability of wavelength was obtained by the extreme care taken in the construction of the set.

The routine at the transmitting stations was to start up the plant and keep it going. A continuous monitoring watch was maintained on both the incoming and outgoing signals, and according to the conditions prevailing the receiving station advised the central telegraph office when to change the operating speed, the route, or the wavelength. Communication by one route or on one wavelength was continued until the signals one way or the other failed, when the route or wavelength was changed; and then this change was carried out, when possible at both terminal stations at the same time. Monitoring was of great importance, and much of the success of a commercial wireless service depended on the efficiency and effectiveness of the monitoring. If the quality of signals fell off the operator at the C.T.O. was only in a position to recognise faults due to bad keying or badly punched tape at the other end. If it was due to any other cause than faulty transmission he concluded that conditions were worse, and he was inclined to ask for the messages to be sent twice—which dropped effective speed to half—or, alternatively, for the operator to send at a lower speed.

The monitory operator on constant watch at the receiving station, however, was immediately able to diagnose the trouble, whether it was due to atmospherics, fading, echo, or jamming, or some fault in the apparatus or landline link. He saved traffic time by indicating the source, if it was at his end of the channel, and could often minimise it, or clear it altogether by balancing the adjustments of his receiver, or by advising a change of wavelength if the source was to be found in changes which were taking place in the physical conditions of the intervening medium between the two stations, or by interference from some other transmitting station.

In addition to the Empiradio Beam services there was another extensive and important group of circuits which had its centre at Radio House, London, and was known as "Via Marconi" telegraph services. Many of these employed long wave channels, but the majority now used short waves, and the number of short wave channels in commercial use were steadily increasing.

On 15 circuits these services transmitted on 17 wavelengths, seven long wave and ten short wave, and the traffic from the corresponding 15 stations was received on some 85 different wavelengths, 39 long wave and 46 short wave.

Transmitting Stations.

Mr. Dowsett then proceeded to describe the wireless stations operated from Radio House, Carnarvon, Ongar, Brentwood, Dorchester and Somerton. Eight transmitters at Dorchester, he said, were worked simultaneously from Radio House, and signals from a similar number of stations were received through Somerton.

The Brentwood receiving station was originally built for the long wave services, and at present the long wave traffic, which in itself had considerable volume, all passed through this station. During the last few years, however, its short wave receiver equipment had been steadily increasing, and now the station had some 24 long and short wave receivers employed on traffic circuits which used some 60 wavelengths within the wide range of 15—30 000 metres. The Brentwood aerial equipment was necessarily varied in character, and illustrated the progressive changes in design which the development of new ideas was constantly bringing about.

One had to realise, said Mr. Dowsett, that the wireless services of the whole world were interconnected commercially, and to a large extent technically, and formed practically one network.

Owing to alternative routes by long or medium or short waves one need never be out of touch with the corresponding station. If for any reason a particular service should break down the outside network was there and became aware of it, and was at hand, if need be, to carry on the traffic. Wireless had the advantage that its transmitters could be switched from one service to another. For the economical running of a number of short programme services this became a necessity, and it was also brought about by the need to change wavelengths to avoid interference, or because of weak signals.

Mr. Dowsett then proceeded to discuss briefly the conditions of propagation which exist in the communicating medium between the wireless transmitting and receiving stations, and which periodically alter according to whether the Great Circle path through the two stations is in daylight, twilight or darkness, or is a combination of all three states. A careful systematic study, extending over a considerable period, had been carried out by the Marconi Research Department at Chelmsford on the strength of signals received from a large number of stations, at various distances and on various wavelengths, during the day and during the night. These observations had shown that on all wavelengths within the range of 15—100 metres, signals fell off in strength up to 100 miles, but below 60 metres there was a recovery of signal strength with increase of distance, the extent of the recovery for daylight transmission being greater the shorter the wavelength used, 15 metres for instance, producing a strong signal at 9 000 or 10 000 miles.

The accepted explanation of these effects was that at distances within 100 miles or so of the transmitter, propagation depended mainly on the direct rays which left the aerial at low angles, the energy from which was soon absorbed, whereas at great distances the received energy was obtained from the radiation leaving the transmitting aerial at higher angles which entered the Heaviside layer and travelled along it with minimum absorption and was finally bent down earthward again, the actual angle incident to the ground at which the rays reached the receiving aerial being about 15 deg.

ROLLING ALUMINIUM ROD.

ALUMINIUM is coming into increasing use for high voltage transmission lines with steel towers and long spans. The accompanying picture shows the rolling of aluminium rod at the Prescot Works of British Insulated Cables Ltd., where there are three rod mills. These are electrically driven, and have a combined weekly output of over 600 tons of rod. The largest of these mills is 210 ft. long by 70 ft. wide, and includes automatic devices for handling the bars, repeaters for the rolls, and automatic winding gear for the finished coils of rod.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

British Industries Fair, Birmingham.

[To the Editor.]

Sir,—The Fair authorities are very anxious to introduce into the Fair anything which will tend to promote smooth working and assist visitors.

There appears to be a demand for some method of signalling throughout the Fair to enable the chairman, secretary or other official to be found, and to convey other messages throughout the building. I understand that the number of different messages that it is desired to transmit is between ten and twenty, and the Fair authorities have asked if we can suggest some method of conveying such signals.

I shall be glad to hear from any firms or individuals who would like to suggest methods of dealing with the problem which I have indicated.—I am, etc.,

W. A. Vignoles,
Director and Secretary,
British Electrical Development Association.

London, W.C.2.
October 7th.

Where *Is* That Battery?

[To the Editor.]

Sir,—Your editorial of August 9th dealing with electric battery vehicles has produced an interesting correspondence, though one notes a tendency of certain correspondents to make it a polite "slanging match."

The electric battery vehicle has its own sphere, from which neither first cost nor speed will oust it. It is rather futile to throw "mud" at battery makers for not having produced a cheaper and lighter battery when it is realised that electro-chemical brains have for 50 years been unable to find a practical substitute for the lead battery other than the almost equally heavy and expensive nickel-iron. Such being the case, manufacturers have only been able to improve along mechanical lines as far as the grid and expanding material for the paste is concerned, both with a view to prevention of the disintegration of the lead at higher specific gravities and the shedding of paste.

Admittedly a lighter and cheaper battery is required and will doubtless materialise in time.

That the electric battery vehicle has its sphere in more than one direction is evidenced by the numbers used by municipal authorities for refuse collection (slow speed), tower, repair and delivery wagons in connection with tramway overhead equipment and electric services to consumers at speeds from 20/25 miles per hour.

So many municipal supply authorities now cater for consumers much beyond their boundary, and the tendency to extend boundaries, necessitating longer runs frequently extending into the country, naturally allows the petrol vehicle, in some cases, to overlap the sphere of the electric. The term "stink wagon" is to be regretted; those with the best interests of the electric battery vehicle at heart are careful to avoid exaggeration, for which there is no need, as the advantages in so many cases are admittedly beyond dispute.

Whilst the development of this type of vehicle is slow it is steadily improving, after certain setbacks, and will do so more rapidly if, as now seems to be the case, cheaper and lighter batteries may be employed.

As an advertising medium any vehicle is an asset, so why throw a brick at an electrical advertisement on a petrol vehicle?

The question of effective speed is entirely one of duty required. A possible speed of, say, 30 miles per hour is not of much use to a dust cart or a bread delivery van unless its delivery area is a long way, say over 10 miles, from its base, in which case the electric delivery is the more efficient even if the long distance supply is by petrol vehicle to a local sub-centre.

People talk very glibly of speeds of 30, 40, 50 miles per hour, and quite fail to realise what average speed means, as a test, or even calculation of speed through traffic, shows. Take an even acceleration per 110 yds. of one mile per hour (between 4 and 20 miles per hour); this gives at the completion of the 16th (i.e. one mile) a time of 5·6 minutes or, say, an average of 11 miles per hour, which is by no means an extreme case, and had a traffic stop been included, as would be quite reasonable, the figure would have been much more striking.

Battery manufacturers, as other commercial concerns, dispose of their profits as may seem most desirable to themselves. However, without exception, they maintain an experienced research and experimental staff which is ever on the look-out for improvements,—I am, etc.,

L. W. de Grave.

Derby.
October 3rd.

Control of Ships' Auxiliaries.

[To the Editor.]

Sir,—We have read with great interest Mr. A. C. Hardy's article "Marine Electricity" in your current issue, and in particular that portion dealing with the control of ships' auxiliaries.

Mr. Hardy says: ". . . there is one school of thought (in Holland particularly) which prefers to control all the auxiliary motors from the switchboard itself. . . . Other people consider that it is a safer arrangement to make each unit separately controllable at the unit itself. The idea has hitherto been used very little in British ships. . . ."

Our experience during the past ten years, extending over most of the prominent British and Dutch lines, is, however, that the general practice was, and still is, to control each auxiliary motor by means of a separate hand-operated starting panel closely adjacent to the motor itself. Mr. Hardy, in fact, states as much in an earlier part of his article, and the practice has certain obvious advantages of simplicity. Equally with automatic control, it provides "control of each motor at the motor itself," for with automatic control a push-button station is provided at the motor.

Actually, the advantage of automatic control (we speak as joint holders of the "Uni-start" system patent) is that, while the control point remains at the auxiliary motor, the bulky portion of the starting equipment is removed to a point (the main switchboard) where, possibly, it can be more easily accommodated. This obviously depends to some extent upon the design of individual ships, but automatic control gear on the "Uni-start" system has recently been installed on several important British vessels.

In particular cases, of course, automatic control may have other advantages. In one well-known British vessel, for example, the pump for the swimming bath is automatically controlled by the patented "Pneutrol" device according to the level of water, i.e., the pump is normally independent of human control. In the case of steering gear motors, automatic control makes it possible for the control point to be away from the steering gear motor or motors.

In conclusion, the practice on most of the Dutch motor ships is, or has been, in general, similar to that on British ships. True, there have been certain cases where motor control panels have been incorporated in the main switchboard (e.g., panels for lubricating oil pumps), but that is because on these particular vessels the engine controls and the switchboard were relatively close together. On these same boats the majority of the auxiliary control panels were adjacent to the respective auxiliaries.—I am, etc.,

For Brookhirst Switchgear, Ltd.,
H. M. Goody.

Chester.
October 7th.

[Several letters are unavoidably held over.—Ed.]

POINTS OF VIEW.

Get electricity across to the people in the same way as automobiles have been put across to them.—*Mr. Henry Ford.*

* * *

A household accustomed to the convenience and value of electricity will curtail its use only under the direst necessity.—*Mr. M. S. Sloan.*

* * *

The coal and steam age has givenp lace to the electrical age, and we stand hesitant, refusing to recognise the inevitable change.—*Prof. H. Levy.*

* * *

It is now relatively simple for the girl to go through the technical school or college education, and with her wits as bright as any man, obtain a degree in engineering at some University.—*Lady Moir.*

* * *

Telegraphy a dying industry? Not yet anyway, and probably not until the day arrives when man will find the medium through which he can transmit, not the written word, but his thoughts, across the sea.—*Mr. James J. Tyrrell.*

NEWS IN BRIEF.

Wireless in German Church—Societies' Arrangements—I.M.E.A. and Meter Certification —Col. Purves' Address to be reproduced in Cardiff.

THE annual Electric Show at New York was opened on Monday and will close to-morrow (October 12th).

The eighth National Exposition of Power and Mechanical Engineering will be held in New York from December 2nd to 7th.

An electrical exhibition, to be held at the Baths, Kingston-on-Thames, from October 14th to 19th, will be opened by the Mayor, Coun. W. E. Blake Carn.

The congregation of a village church in Germany have dismissed their pastor and installed a wireless set in his stead. The services are to be received from Berlin.

The annual dinner of the Institution of Railway Signal Engineers will be held on October 25th, at the Criterion Restaurant, London.

The next general meeting of the Institution of Mechanical Engineers will be held on October 18th, when Mr. Daniel Adamson will deliver his Presidential address.

The first meeting of the 1929/30 session of the Students' Section of the North Eastern Centre of the I.E.E. will be held to-night (Friday), when the chairman, Mr. Vernon Clements, will deliver his address.

The opening meeting of the Autumn Session of the Birmingham and Midland Branch of the Electrical Association for Women, was held at the Queen's Hotel on September 26th, when about 100 members were present. Miss C. Haslett spoke on the need for education in the use of electricity, and Miss Palmer dealt specifically with "Electricity in the Schools." Miss Barrie, headmistress of King Edward's High School for Girls, presided.

The annual festival of the E.T.B.I. will be held at the Savoy Hotel, London, on November 26th, with Mr. H. Marryat, the president, in the chair. The dinner will be followed by a dance.

Liverpool Corporation has been recommended to place a contract for the extension of the electricity supply and lighting department premises at Highfield Street, Liverpool, amounting to £20 493.

Leeds Electricity Committee has been informed that the I.M.E.A. is of opinion that there is not, at present, sufficient justification to demand new legislation on the subject of the certification and stamping of electricity meters.

Imports of electrical goods into the Irish Free State during the period January to August last amounted to £387 197 compared with £285 921 during the same period last year. The figures for August this year and last were £39 949 and £39 210, respectively.

The opening meeting of the 1929-30 session of the A.S.E.E. will be held on October 15th at the Junior Institution of Engineers, when Mr. S. B. Donkin will deliver his presidential address, "The Production of Power from Natural Sources other than from Fuel." The chair will be taken by Mr. B. C. Garman, the chairman of the Association, and refreshments will be served from 6.30 to 7 p.m.

The Borough Engineer of Hastings has found it necessary to discontinue the supply of water for the purposes of the East Hill lift, which has therefore been closed. He suggests that an electric pump should be installed, by which means the water required for the lift could be repeatedly used, with very little waste. The cost of such a pump is estimated at £250, including fixing, and the estimated cost of current is 0·3d. for each time the lift is used. The Parks Committee recommends the provision of the pump.

LOOKING BACKWARD.

FIFTY years ago, according to THE ELECTRICIAN, *dated October 11th, 1879:—*

A mariner's compass was introduced which caused an electric bell to ring if the vessel deviated from a predetermined course.

Several railway companies were favourably considering the lighting of railway stations by electricity.

Profs. Ayrton and Perry were explaining the contact theory of voltaic action.

* * *

TWENTY-FIVE years ago THE ELECTRICIAN *of October 14th, 1904, stated that:—*

Prof. Sylvanus Thompson publicly decried the use of the "live rail" on railways, characterising it as an obsolete device and an engineering blunder.

It was proposed that Kabul, the capital of Afghanistan, should be lighted electrically.

* * *

FIFTEEN years ago THE ELECTRICIAN, *dated October 9th, 1914, reported that:—*

Street lighting restrictions were imposed in London.

The invention was reported from Italy (but not subsequently confirmed) of a radio receiver which could be "worked by means of a connection with an electric light circuit."

The Midland Electrical Engineers' Ball will be held at the Grand Hotel, Birmingham, on November 15th.

The Secretary for Mines, on September 11th, made an Order approving the "Ringrose Miners' Lamp," subject to certain conditions.

The Batti-Wallahs' Society will hold a luncheon at the Hotel Cecil, London, on November 7th, at which there will be an address by Mr. Frank Hodges.

The application under the Merchandise Marks Act, 1926, for the marking of imported electrically driven vacuum cleaners is not being proceeded with.

The second general meeting of the 1929/30 session of the South Wales Branch of the Association of Mining Electrical Engineers will be held at the South Wales and Monmouthshire School of Mines, Treforest, tomorrow, Saturday.

The twenty-first annual dinner of the Faraday House Old Students' Association will be held on October 25th, at the Savoy Hotel, London. Dr. Alexander Russell, F.R.S., Principal of Faraday House and President of the Association, will be in the chair.

The twentieth annual exhibition of electrical, optical and other physical apparatus is to be held by the Physical Society and the Optical Society on January 7th, 8th and 9th, 1930, at the Imperial College of Science and Technology, South Kensington, London.

The Western Centre of the I.E.E. has arranged with the Post Office Engineering Department for the Presidential Address of Col. Sir Thomas F. Purves, to be delivered in London on October 24th, to be reproduced by means of loud speakers in the Conference Room of the South Wales Institute of Engineers.

Edinburgh T.C. has adopted the Lord Provost's Committee's recommendation that automatic traffic control systems be installed at the Duddington cross roads and the Niddrie cross roads.

A new telephone cable, 335 miles in length, from Paris to Bordeaux, entirely underground, has been put into service. The new cable, which cost about £1 520 000, is part of a national scheme, of which the first link, from Paris to Lyons and Marseilles, was inaugurated recently.

The Surveyor to Northfleet D.C. has arranged with the Borough Electrical Engineer of Gravesend for a separate circuit to enable Northfleet Council to take advantage of the power rate to drive the small motor which operates the oil-firing apparatus used in connection with the heating of the municipal offices.

The Board of Trade Standing Committee under the Merchandise Marks Act, 1926, has recommended that permanent magnets and certain tools imported into this country shall bear an indication of their origin at the time of sale or exposure for sale, the indication of origin to be applied by die stamping or other mode of impressing, etching, engraving or casting.

The opening fixture of this session's activities of the Electrical Association for Women took place on September 27th, when members of the Women's Engineering Society and the E.A.W. visited the Shipping, Engineering and Machinery Exhibition at Olympia. On September 28th the Surrey branch of the Association of Teachers of Domestic Subjects again held their annual meeting at the E.A.W. Club Room, 46, Kensington Court, W.8, followed by a lecture on "The Common-sense Handling of Electric Appliances," by Mr. R. W. Kennedy, arranged at the request of the teachers.

PERSONAL.

ESTATE of the gross value of £14 841, with net personalty £14 276, was left by the late Mr. William Sharman Toplis, electrical engineer, who died on August 25th, aged 52 years.

Mr. A. P. M. Fleming, of the Metropolitan-Vickers Electrical Co., Ltd., has been appointed by the board of directors of the American Institute of Electrical Engineers to be honorary secretary for England for the two-year term August, 1929, to August, 1931. The local honorary secretaries are appointed under Section 46 of the Constitution of the Institute. The duties of the appointment include assisting the board with regard to applications for membership, extending courtesies to travelling members, and other services. Mr. Fleming's appointment is in succession to Mr. C. le Maistre, whose term has just expired.

Mr. A. P. M. Fleming, who has been appointed local secretary of the A.I.E.E.

Unsettled estate of the value of £65 224, with net personalty £47 846, was left by the late Lord Montagu of Beaulieu, chairman of Edison Accumulators, Ltd., who died on March 30th.

Unsettled estate of the value of £2 745, with net personalty £2 562, was left by the late Sir Sydney H. C. Hutchinso formerly director-general of Indian Government Telegraphs.

Sir Hugo Hirst, who has been re-elected Master of the Glaziers' Company, has inaugurated a scheme for rebuilding the Glaziers Hall, which was destroyed in the Great Fire of London in 1666.

Oswestry Corporation, which has taken over the Oswestry Electric Lighting and Power Co., Ltd., has decided to appoint Mr. H. W. Edwards, the company's engineer, as borough electrical engineer.

Estate of the gross value of £4 275, with net personalty £1 272, was left by the late Mr. Christopher Thomas Briscoe, chairman of C. T. Briscoe and Son, Ltd., electrical engineers, Blackburn, who died on July 23rd.

Mr. Howard Long, latterly manager, illumination department, Metro-Vick Supplies, has resigned his position to take up an appointment with the Benjamin Electric, Ltd., in charge of their lighting engineering services.

The following have been selected for interview out of 52 candidates for the post of engineer and manager of the municipal tramways and omnibus undertaking at Plymouth, made vacant by the resignation of Mr. H. P. Stokes:—Mr. R. Hoggard, general manager, Chesterfield Transport Department; Mr. F. G. Ford, traffic superintendent, Plymouth Transport Department; Mr. W. T. Young, engineer and general manager, Halifax Tramways; Mr. C. Jackson, general manager and engineer, Oldham Tramways; and Mr. J. A. Baker, general manager and engineer, South Shields Tramways. The salary offered is £850 per annum, rising to £1 000.

Obituary.

MRS. WHITMOYER, suddenly, on October 1st, the wife of Mr. J. C. Whitmoyer, manager of the Contracts Department of the Metropolitan-Vickers Electrical Co., Ltd.

MR. WILLIAM BANNISTER, on October 1st, aged 81 years. He was an original director, and for the past 27 years chairman, of the Chloride Electrical Storage Co., Ltd. He transformed this undertaking from a small concern, occupying one building, now used for the publicity department alone, into one of the three largest accumulator making concerns in the world. See page 445.

DR. RICHARD VERNON HANSFORD, on Sunday, as the result of a fall, aged 41 years. He had been attached to the engineer-in-chief's office at the Post Office. He was prominently connected with the introduction of the Transatlantic wireless telephony service, and was especially concerned with the design of transmitters for short-wave work. He was well known on the Continent and in the United States, and only returned last week from an international conference at The Hague. He was a Doctor of Science, a member of the Institution of Electrical Engineers, and was awarded the Willans Premium.

BUSINESS ITEMS.

TRUSLOVE AND CO., LTD., of Colchester, have opened new showrooms and offices in High Street, West Mersea, where a supply of electricity is about to be given by Colchester Corporation.

The CRYPTO ELECTRICAL CO., LTD., at Willesden, which recently acquired the business of "The Langham Gears" of Slough, has now completed the equipment of a new factory adjoining their present works in Acton Lane.

A firm of manufacturers' agents in Johannesburg desires to obtain additional agencies for electrical goods, etc. A partner of the firm is at present in this country and will be prepared to interview British manufacturers. The Department of Overseas Trade has further particulars. (Reference No. 356.)

With reference to our description of the "Sadia" stand type boiler on page 362 of the September 27th issue, we are asked to point out that a 44-gallon boiler of this type heated to 185 deg. F., only falls 7·5 deg. F. in 12 hours, provided no water is drawn off. The figures 39·5 were supplied in error.

With reference to the paragraph concerning the Electro-Velocity Radiator of the Artic Fuse and Electrical Manufacturing Co., Ltd., which appeared on page 364 of our September 27th issue, owing to a typographical error, the wording gives the impression that there are uncomfortable draughts, whereas there are no uncomfortable draughts with this form of radiation.

LIGHTING TRADES, LTD., with which is incorporated the WELSBACH LIGHTING CO., LTD., has effective showrooms arranged at Oriel House, 30/31, Farringdon Street, London, E.C.4, where the best products in the way of lighting fittings of the two concerns are displayed. The showroom consists of one large room oblong in shape and several small square rooms, some of which are devoted to period work and some to particular types of modern fittings.

The first of the smaller rooms contains modern imitations of Georgian, Sheraden and other Old English fittings in the candelabra style. Some of the "Tudor" models are especially effective. Lighting Trades, Ltd., also manufacture period fittings to architects' specifications; for example, their large "Hampton Court" pendant is a modern edition of a sixteenth century candelabrum in Hampton Court Palace.

A trade mark which we understand has recently been registered by the firm is "Moonmist," applied to special pressed glass of their own manufacture. This glass can be either pure white or slightly tinted. The best example at present on view is an ornamental plaque, taking a semi-oval form, embossed with a detailed representation of a three-masted sailing ship. In this case the glass has a faint yellowish tint, and when the lamps in the ship's base are switched on, the glowing appearance of the ship—without any direct source of light being visible—is very pleasing.

In connection with the new Polish broadcasting scheme which has recently been announced, it is interesting to learn that the contract obtained by the MARCONI'S WIRELESS TELEGRAPH CO., LTD., includes the provision not only of six new broadcasting installations, but also elaborate repeater equipment and correcting apparatus for landlines. This will be installed to carry out improvements in the scheme already in operation for the exchange of broadcast programmes between Warsaw and Berlin, Prague, Vienna and Budapest.

The National automatic telephone exchange, which is one of the new 10 000 line exchanges recently cut into commission, is equipped with two "Alton" batteries each of which has a capacity exceeding 10 200 Ah at the 10 hour rate of discharge. Both of these batteries are made up of 47-plate cells each weighing closely on 3 tons. The plates measure 20 in. by 30 in. each positive and negative weighing about 70 lb. and 45 lb. respectively, and the batteries are capable of giving an output in excess of 5 100 A for one hour. The dimensions of the cells are nearly 4 ft. in length and height, and 2 ft. 6 in. wide. See page 441.

Upwards of 90 members of the Ipswich Engineering Society journeyed to London on September 26th by motor coach to make a tour of the Osram Lamp Works of the General Electric Co., Ltd., at Hammersmith. The party, accompanied by Mr. C. J. Robinson, secretary of the society, and Mr. F. Crush, manager of the Ipswich branch of the G.E.C., included members from all the principal engineering firms and works of the Ipswich district, the electrical engineers section of the L.N.E.R. and the local Electrical Contractors' Association. There were also representatives from a number of East Anglian garages, architects, and others interested in electrical matters.

LEGAL INTELLIGENCE.

Case Against the S., W. and S. Electric Power Company Dismissed.

At the Oldbury Police Court on October 1st, the Magistrates dismissed a case brought against the Shropshire, Worcestershire and Staffordshire Electric Power Co. by the Director of Public Prosecutions for an alleged breach of Regulation 18 (d) under the Factories Act, relating to sub-stations. The case arose out of a fatal accident in the McKean Road sub-station at Oldbury on July 4th. A fully competent electrician with his mate was instructed to remove from a block of steel clad switchgear, a spare cubicle bolted to the cubicle containing the incoming switchgear operating at 5 500 V. In order to do this it was necessary to unbolt the spare cubicle from the incoming cubicle. The incoming cubicle was built in three sections—the top section containing busbars, the middle section containing oil switch, and the bottom section containing the incoming cables. Before commencing the work, the electrician tripped the oil switch and drew the isolating links, thus making " dead " the middle and upper sections of the incoming cubicle, and also the whole of the spare cubicle. The incoming cable remained " alive," but the bottom section, enclosing the terminals of this cable was made safe by a screwed-on steel cover. After the spare cubicle had been unbolted, the electrician unscrewed the back plate of the middle section of the incoming cubicle, and also took off the protective plate of the bottom section of that cubicle for inspection. He then noticed a lamp wire in the middle section of the cubicle which connected with the detached spare cubicle, and omitting to replace the plate on the bottom section containing the terminals of the incoming cables, proceeded to remove the lamp wire from the middle section. In so doing his knee came into contact with the terminals and he was killed.

A representative of the Director of Public Prosecutions appeared for the prosecution, and Mr. E. S. Herbert, of Messrs. Sydney Morse and Co., for the company.

The case for the prosecution was that no work should have been done on the switchboard without first making " dead " the whole of it, including the incoming cables, and that there was no independent provision for making " dead " those cables except by disconnecting the whole of the cable at the Oldbury Road sub-station some distance away, thus disconnecting also a number of consumers *en route*.

The company contended that the case fell within Regulation 18 (d) (ii) and that as the switchboard was built in sections, and each section could be made " dead " independently, and as it was not necessary actually to do any work in the " live " section, there had been no breach in the Regulations.

The Magistrates found as a fact that the switchboard was built in sections and came within Regulations 18 (d) (ii), and that no work had to be done in the " live " section. The case was accordingly dismissed.

New Distributors of Edison Storage Batteries.

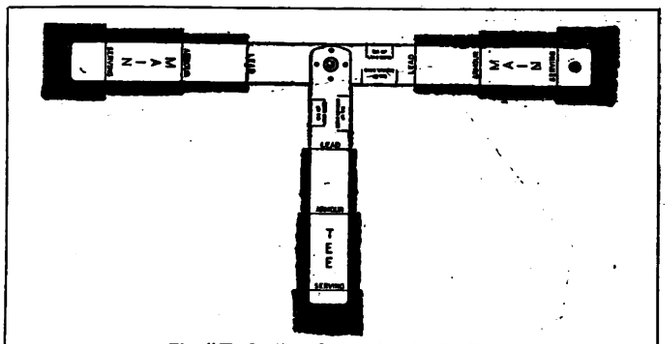
With reference to the motion brought by Edison Accumulators, Ltd., against the New Distributors of Edison Storage Batteries, Ltd., and reported in THE ELECTRICIAN last week, actually the sign complained of was at the back of the stand on the gallery balustrade, was erected by the exhibition authorities themselves, and did not form part of the exhibit of New Distributors of Edison Storage Batteries, Ltd. The reproduction of the stand on page 408 of the same issue containing the report shows clearly that the name of the company was correctly displayed over the stand.

ELECTRICAL SWIMMERS.

The " Sunco " Swimming Club held their first annual gala at the Holborn Baths on September 30th, when several interesting events were contested. Principal among these were the finals for cups presented by Mr. A. G. Beaver and Mr. R. Tweedy-Smith, the former being for men and the latter for ladies. The cups were won by Miss Glover and S. Davidson. A pole fight, in which R. J. Willis succeeded in upsetting all his opponents, caused much amusement. The G.E.C. were successful in the mens' team race, and Mr. Marsh, of Siemens, won the 90 yards race in great style. The events were concluded with a " Good-night " race (won by Mrs. Willis), in which ladies swam with night gowns over their costumes and a lighted candle held aloft. Prizes were then presented by Mrs. R. Tweedy-Smith.

CABLE TEMPLATES.

In introducing a range of steel templates for use with cable-grip boxes, W. T. HENLEY'S TELEGRAPH WORKS CO., LTD., Holborn Viaduct, London, EC..1, point out that modern business methods demand something more than the mere selling of an article and leaving it at that. For example,



The "Henley" cable template in detail.

motor-car manufacturers quickly realised that in order to help their sales they must consider the transaction from the buyers' view-point, and give items of service which definitely assisted the owner in getting the most out of his car. But when one considers specialised articles of electrical distribution gear they do not appear to offer much scope for such organised selling methods. Take a service box, for example. To the engineer, a service box can be considered as just so much cast-iron. But looked at by the actual user, it is something which, if properly designed, can materially assist him in his daily job. Yet one can go much further even than the creation of the perfectly designed cable box. With cable-grip boxes are supplied printed cards with " Notes for the Jointer," which give him the quickest way to instal them. The introduction of a range of steel templates for use with these cable-grip boxes is another item of service. The idea of using such a template when stepping back distributor and service cables is of considerable value as an aid to better and quicker service installations. On each " arm " of the template is engraved the respective markings for stepping back to the lead armour and serving of the cables whilst the diameter of the armour grip and of the lead bond is also shown. The illustration gives an idea of the template, and a neat canvas case is supplied.

SUPPLY IN ULSTER.

Report of Electricity Commissioners for Northern Ireland.

A REPORT on the work of the Ministry of Commerce and the Electricity Commissioners for Northern Ireland deals with applications for Special Orders, the establishment of new and the extension of existing generating stations, the construction of main transmission lines, and borrowing by local authorities for electricity purposes. Appendices show the stage of development attained by undertakings giving a public supply of electricity under statutory powers, and the capital expenditure and working costs of the undertakings, fuel consumption, load factor and sales of current. A notable feature is the increase in the number of units sold by the Belfast Corporation undertaking, 56 212 857 kWh having been sold in the year ended March 31st, 1927. An appendix shows the growth of the sales of electricity in Northern Ireland during the years 1924 to 1927. The report mentions that while the average consumption in Northern Ireland had increased in 1927 to 47 kWh per head of population, such a figure is still considerably below the average rate of consumption in Great Britain. Reference is made to the powers granted by Parliament to the Antrim Electricity Supply Co. for the generation of electricity on the lower river Bann, and also to a comprehensive scheme for the County of Down, embracing as a first step the borough of Bangor and urban district of Holywood. The development of the Lagan Valley district, through the linking-up of centres in that area with the Belfast system, has already been commenced by the erection of a main transmission line between Belfast and Lisburn, and the extension of this line to Lurgan and Portadown is foreshadowed. It is pointed out that the application of electrical power to rural industry is likely to be slow.

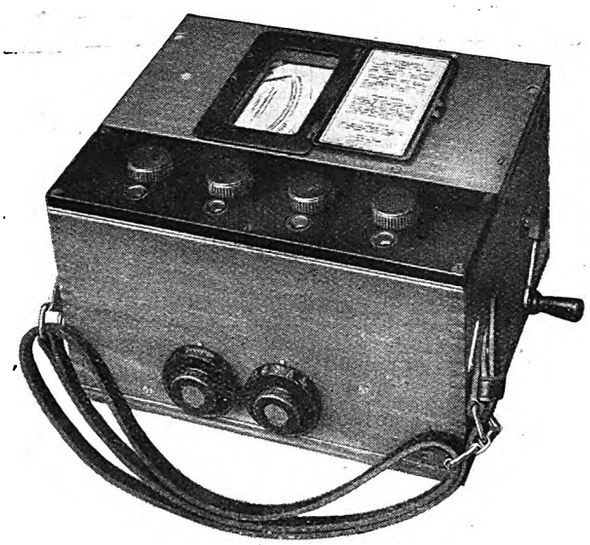
BRIDGE OHMMETER.

An Instrument Combining an Ohmmeter and Wheatstone Bridge.

THE object of the "Bridge Ohmmeter," introduced by the RECORD ELECTRICAL CO., LTD., of Broadheath, Manchester, is to provide means for extending the range of an ohmmeter to enable it to measure low resistances, such as are met with



The "Bridge Ohmmeter" by the Record Electrical Co., Ltd.

in ordinary general industrial work. An ohmmeter usually gives its first indication at 10 000 Ω and will measure any higher value up to 100 megohms and infinity. The Bridge Ohmmeter will measure resistances from 0.01 Ω up to 999 900 Ω on the bridge and from 10 000 Ω to 100 megohms on the ohmmeter scale; it also indicates a short circuit or open circuit.

The instrument consists of four essential units: a generator for producing the necessary current at high pressure, a direct reading ohmmeter convertible into a galvanometer for bridge tests, a decade resistance box with ratio switch in one arm of the Wheatstone bridge, and a multiple contact switch for changing connections from an ohmmeter to a Wheatstone bridge, all arranged in a portable carrying case complete with handle and shoulder strap.

The containing case is made of teak, which has natural resilience which renders it eminently suitable for portable apparatus.

The indicating unit consists of two coils mounted on the same spindle placed at an angle to one another, both rotating in the field of a permanent magnet. One coil carries the leakage current, the other exerts a controlling torque equivalent to the spring of a voltmeter, but with the difference that whereas a spring exerts a constant torque, a coil control varies with the pressure and automatically compensates for any variation in the testing voltage. Temperature errors due to the coils, any drop in magnet strength, and errors due to stray magnetic fields, all cancel out, due to the system of coil control.

The generator is wound for two voltages: 500 V for insulation testing and 250 V for ohmmeter testing. The voltage is automatically changed by the switch used for converting the instrument from an ohmmeter to a Wheatstone bridge. The generator is fitted with a constant pressure clutch which evens out voltage fluctuation and ensures steady and accurate readings on circuits having inductance or capacity. The Record improved handle is of novel design, and a departure from the usual folding knee joint. The handle consists of a lever in the form of a round rod with a handle firmly attached thereto; this shaft fits in a closely-fitting sleeve and a right angle turn folds the projecting handle flat against the case.

The current given to the circuit by the generator depends upon the resistance under test. At infinity, of course, no current flows, but the potential at the terminals is highest, viz., 500 V at a handle speed of 160 r.p.m. In making measurements on circuits where capacity and inductance are present, care must be taken to speed the handle until the clutch slips.

The internal resistances are carefully and accurately wound and adjusted, the instrument is protected from shocks by substantial rubber feet, the pointer comes instantly to rest at the correct indication, and is not affected by varying the speed of the generator except as explained in a previous paragraph. The variable decadence resistance box consists of four dials—units, tens, hundreds and thousands—indicating from 1 Ω to 9 999 Ω in 1 ohm stages. By means of the ratio coils these figures can be multiplied or divided by ten or hundred, thus extending the range from 0·01 Ω to 999 900 Ω.

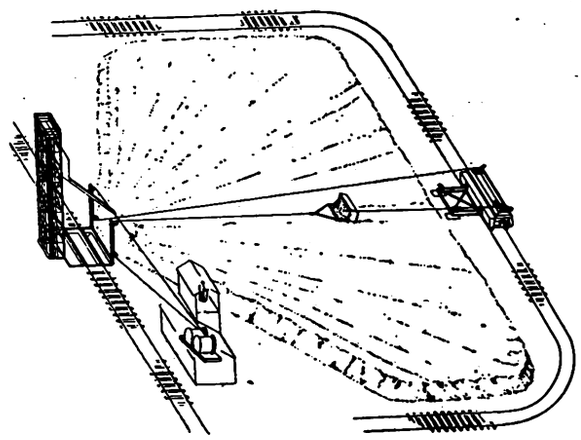
To test insulation resistance connect the conductor to the terminal marked "line" and the casing to the terminal marked "earth." Turn the control switch to ohmmeter. All the connections are then made for "ohmmeter." Turn the generator handle steadily at about 160 r.p.m. The pointer will immediately deflect across the scale and come to rest at a scale mark corresponding to the value of the insulation.

To measure low resistance—say a coil of wire—connect the ends to the same pair of terminals as for ohmmeter tests, turn the control switch to bridge, which changes the internal connections to those of a Wheatstone bridge, the current coil of the ohmmeter becoming the galvanometer coil and its deflections controlled by the pressure coil, the function of which is equivalent to the control exerted by the spring or torsion strip of an ordinary galvanometer. Turn the generator handle very slowly at first and increase or decrease the resistance until the pointer approaches balance on the infinity line; the generator speed should then be increased and final balance obtained. If the figures appearing in the windows of the resistance box are 771 and the ratio switch set to "divide by 10," the value of the resistance under test is 77·1 Ω.

MECHANICAL HANDLING.

Some Interesting Equipment Recently Installed in South America.

AN installation which illustrates the latest practice in the mechanical handling of coal and ash is that recently supplied to a works in Buenos Aires by the Underfeed Stoker Co., Ltd. The coal, which is of the "run-of-mine" bitumous



Sketch showing the principle of the "Beaumont" drag scraper conveyor.

variety, arrives at the works by railway and is discharged into a concrete track hopper below the ground level ready for conveyance to the storage dump or elsewhere. An understanding of the part played by the mechanical equipment will be gleaned from the illustration above.

The general principle is the same for practically any crushed material, and the equipment at Buenos Aires consists of an electrically driven "Beaumont" automatic skip hoist with "Simplex" loader, which cannot be over or underloaded, for the continuously running small wagons or skips which are taken up vertically by an endless wire rope, operated by a 30 H.P. electric motor. The normal capacity of this hoist is 70 tons of coal per hour, discharging to an overhead steel plate bunker, the whole arrangement being carried by a girder-work tower. From the bunker the raw coal discharges through an electrically driven "Norton" coal crusher, also with a capacity of 70 tons per hour, driven by a 15 H.P. motor. This passes the crushed coal down to an endless mild steel belt conveyor travelling at 300 ft. per minute which discharges as desired. The belt is 115 ft. long between centres and 1 ft. 6 in. wide, driven by a 5 H.P. electric motor.

A coal storage dump arrangement adjoining the skip hoist, discharges, by an overhead by-pass chute, in the opposite direction any desired amount of coal to one corner of the dump, instead of to the "Norton" crusher and the belt conveyor. The Underfeed Stoker Co., Ltd., has taken over the sole manufacturing rights in Great Britain and the British Empire of all "Beaumont" mechanical handling appliances.

MANUFACTURERS' EQUIPMENT

New Equipment for Works—Testing Metal by Machinery—A New One-piece Industrial Lighting Fitting.

OWNERS of works, etc., whose equipment includes liquid starters will be interested in the new starter recently introduced by the BRUSH ELECTRICAL ENGINEERING CO., LTD., Falcon Works, Loughborough. These are built as plain rotor starting rheostats for induction motors or as starting rheostats for d.c. motors; they can also be adapted for certain other purposes. When the starter is used with an induction motor the liquid starter is connected in the rotor circuit only, and a separate stator switch has to be provided. For a d.c. motor there is required, in addition to the starter, a circuit-breaker, which should be fitted with a field discharge contact (closing as the breaker opens) and a metallic-type field discharge resistance connected to this contact. The starter has no automatic releases, so that whenever the motor is stopped the blocks must be raised manually before the circuit-breaker is closed again.

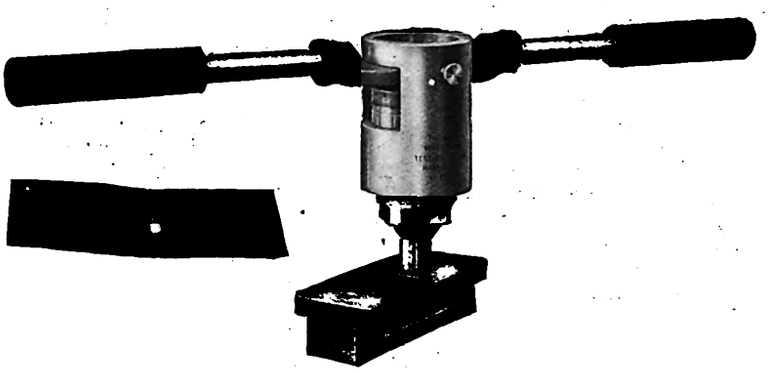
An s.p., s.t. air-break ironclad switch can be fitted to any of these liquid starters and interlocked mechanically with the operating gear. This can be used as an electrical interlock with the circuit-breaker, to ensure correct sequence. Motors are normally sent out with the auxiliary switches arranged to be closed when dippers are raised.

The starters are of industrial type arranged for floor mounting. The cast iron tanks are supported (with insulation) on mild steel rods fixed in cast iron end frames. The sheet iron dippers are fixed at one end to a steel spindle at one side of the starter. Rotation of the spindle causes the dipper to enter or leave the liquid. As the dippers enter, the resistance of the starter falls gradually until the position of maximum immersion is approached. A copper bar on the dipper frame then makes contact with a number of controller-type contact fingers on the tank, so establishing an effective short circuit. When raised, the dippers of standard starters leave the electrolyte entirely, but if preferred they can be arranged not to break the circuit completely—this being standard practice in the case of high voltages. Plain or perforated, sheet-metal covers prevent accidental contacts with live parts.

The operating gear of one, two, three, and four-tank starters consists of crank handle, machine-cut screw, nut, connecting rod and crank. Six-tank starters have a large hand-wheel, a balance weight and ball bearings; the self-locking character of the gear is retained. The standard arrangement for cable fittings comprises three wood-bushed holes for single-core V.I.R. insulated cables, but, if required, the cable entrance can be screwed for conduit without extra cost. Trifurcating boxes, having armour clamps and/or sealing chambers, can be provided as an extra. The electrolyte is prepared by dissolving common soda in water, the amount of soda, which depends on capacity, voltage, etc., being determined by experiment.

The searchlight of the London Electric Firm for use in prospecting work.

PHILIPS LAMPS, LTD., Philips House, 145, Charing Cross Road, announce the introduction of an improved type of their N.R. industrial reflector. The outstanding feature of the new type is that it is stamped from one piece of heavy gauge metal with an entire absence of welded or other joints. The angle of the cut-off is in accordance with Home Office recommendations. The fittings are made in five sizes, ranging from 10 in. to 18 in. in diameter, and can be supplied with hook suspension or screwed bush ($\frac{5}{8}$ in. and $\frac{3}{4}$ in. conduit thread or $\frac{1}{2}$ in. gas). The 10 in., 12 in. and 14 in. sizes can, in addition, be supplied with $1\frac{1}{8}$ in. hole. The reflectors are manufactured from vitreous enamelled heavy sheet steel, white inside and black outside, and the workmanship is stated to be of the highest standard throughout.



The "Avery" sheet metal testing equipment.

FRY'S (LONDON), LTD., of 24-26, Water Lane, Queen Victoria Street, London, E.C.4, have sent us particulars of their new-process "Enox" hack-saw blades. For general use the "Enox" standard S.T. type blade is recommended, but for works where only one class of material is dealt with there are offered a number of different kinds of blades—hardened and tempered to suit the jobs to be done. It is stated that the "Enox Flex" blade is almost impossible to break, while teeth cannot be ripped by unskilful use. The "Enox S.T." blade is another new line of the all-hard type, apparently a compromise between "Enox Standard" and "Enox Flex." Other blades offered are "Enox Alumin," for cutting aluminium; "Enox Cable Cutting," for wire and tape armoured cables; "Enox Type A.E.," for hard steels; "Enox Type S," for use in high-speed machines employed for cutting joists and sectional steels; "Enox TT," a flexible blade, with special set to the teeth and suitable for electrical conduit; "Enox 14," for cutting nickel chrome and other hard alloy steels. These blades are made from Sheffield 14% tungsten, cost four to five times as much as standard saws, but are claimed to cut usually seven to ten times as much. "Bi-kut" is a patented type of blade with groups of four teeth placed alternately, to cut both on forward and backward strokes. Suitable for rail cutting and for hand-operated saws, while the "Brasso" double-edged is for cutting tubing and soft metals. The "Brasso-Duplex" is yet another blade, and this is made of 21 gauge tungsten steel, about $\frac{5}{8}$ in. wide. The teeth have a wavy set, and on one edge the pitch is 18 T. to the inch (for cutting bolts, bars, etc.), while on the other the pitch is 28 T. (for cutting light sectional material).

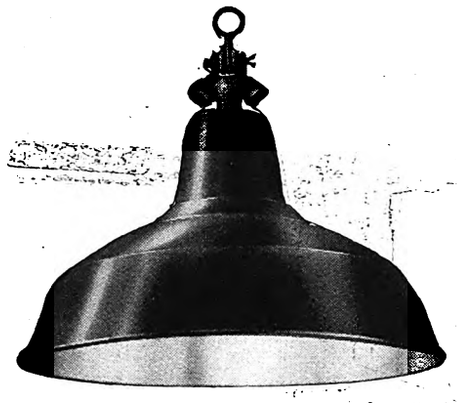
The "Avery" sheet metal testing machine manufactured by W. AND T. AVERY, LTD., Soho Foundry, Birmingham, appears to furnish a simple method of ascertaining the relative ductility of sheet metal. The means adopted is the distension of a circular disc of the metal to a dome-like form until the point of fracture is reached. The machine measures the thickness of the metal and the height of the test specimen under distension: the micrometer graduations read to 0·01 m/m for thickness and 0·02 m/m for distension. A clamped or slip distension test can be given at the operator's choice; the difference in the height under distension when free to slip and when clamped gives an index of the workability of the material as distinct from ductility. Furthermore, the appearance of the dome surface after a test gives useful information as to the crystal structure of the metal.

The Avery machine consists of a vertical axial assemblage of distending spindle, inner and outer members, interconnected by screw threads, together with cross handles, the central portion of which carries the upper orifice washer. The upper end of the distending spindle supports a standard precision steel ball. The intermediate member—which, like the spindle, terminates in a square at the lower end—supports a duplicate orifice washer.

The test specimen, which should be 2 in. wide, with parallel edges, is inserted in the aperture below the cross handles and

Digitized by Google

the larger square is then placed in the stand. The cross handles are next rotated to easy contact, and the thickness of the specimen measured by the graduations shown in the aperture below the handles. For a clamped test, rotation and leverage of the handles is continued, while for a slip test the specimen is just eased from contact. The test is completed by placing the lower square of the distending spindle in the stand and rotating the handles. Operation ceases when the specimen fractures. The maximum thickness of mild steel which the machine is capable of distending is 10 B.G. However, it is stated to be preferable to confine its use to 16 B.G.



The new industrial one-piece lighting fitting of Philips' Lamps, Ltd.

The "Total" fire extinguisher of L. E. Wilson and Co., Ltd., Hodson's Court, Corporation Street, Manchester, consists of a cylinder partly filled with sodium bicarbonate powder and a central cylinder full of carbon dioxide gas under high pressure. The turn of a wheel opens the gas outlet, and a powerful jet of gas and powder is emitted. The insulating qualities of CO_2 are claimed to enable "Total" extinguishers to be used at close quarters and for directing on live conductors with comparative safety; indeed, it is stated to be quite safe on h.t. work up to 100 000 V. Special features of the "Total" system are that the extinguishers are not affected by climatic conditions, the charge will not deteriorate over a period of some years. The contents can be removed for inspection by simply unscrewing the cap, and be replaced, and the "Totalite" powder is clean and dry.

The soldering irons of The General Electric Co., Ltd. (Magnet House, Kingsway, London, W.C.2), are now made in four different sizes. H.O. 5 914 and H.O. 5 915 are suitable for small work and for use in confined spaces, as behind telephone switchboards. H.O. 5 916 is a medium-sized iron, and H.O. 5 917 a heavier iron, of the same general purpose type, but designed to cope with work of a continuous nature. Each pattern is provided with an earthing terminal and wired with a length of 3-core cab tyre sheathed flexible cord. H.O. 5 916 and 5 917 are fitted with replaceable heating elements. The specifications are as follows:—

No.	Consumption. Watts.	Size. Ins.	Weight.
HO 5 914	60	$\frac{7}{8}$ dia. × 9	13½ oz.
HO 5 915	100	$\frac{7}{8}$ dia. × 12	1 lb. 2 oz.
HO 5 916	175	1¼ dia. × 13	1 lb. 14 oz.
HO 5 917	300	1½ dia. × 14	2 lb. 13 oz.

What is said to be a novel and highly efficient device for branding wood, cork, ebonite, leather, rubber, etc., is manufactured by Ellis and Coe (C. S. Ellis), 308, King Street, Hammersmith, London, W. It is known as the "Kausis," and can be supplied either as a small hand model or fixed to a press. The suitable voltages are 110 and 220; the consumptions are, No. 1 "Kausis," 200 W.; No. 2 "Kausis," 250 W.

Some of the interesting apparatus produced by The Rapid Magnetting Machine Co., Ltd., of Magnet Works, Lombard Street, Birmingham, has previously been described in The Electrician. Two new additions to the firm's range of labour-saving appliances are the "Rapid" self-contained magnetic truck, for picking nails, etc., from the floor, and the "Rapid" patent chute with foolproof stop-feed and discharge, for granular material. Both these additions to the firm's range we hope to describe in detail in a later issue devoted to manufacturers' equipment.

The Midland Electric Manufacturing Co., Ltd., M.E.M. Works, Barford Street, Birmingham, have sent us particulars of a new range of switches entitled the "Memrex Senior." These new switches are of the "Memrex" pattern, but provided with top and bottom cable entry; knockouts are also provided, thus making the switch suitable for almost every position and method of wiring. The case is weather-proof and lined with white insulating enamel. The new series of switches complies fully with B.E.S.A. Specification 124, and is licensed to be so marked.

The Martindale Electric Co., Ltd., of The Hyde, Hendon, London, N.W.9, are producing a series of tools for armature repairs and commutator maintenance. These include air gap and feeler gauges, coil tamping tools, and commutator slotting files. The firm also sells "Commulac," an insulating liquid for painting slots on undercut commutators to reduce the possibility of short circuits. "Commulac" is oil-proof and withstands sparking without softening. The preparation is specially suggested for mine locomotives, pig mill motors and other equipment in dirty locations.

Mawdsley's, Ltd., of Dursley, are now manufacturing a welding equipment known as the "Mawdsley A.D.C. Multi-operator" welding set. The dynamo is compound wound, and designed to give a voltage only slightly in excess of that required at the electrodes. Usually the dynamo is made to give 35 V, but occasionally a higher voltage is necessary, as where the operator is a long way from the machine or when heavily coated electrodes are being used. The necessary increase in voltage to the 60 or 65 V needed for striking the arc is obtained in the following simple manner. From two slip-rings fitted to the armature of the welding dynamo a.c. is taken to the primary of a small transformer. The secondary of this transformer forms part of the welding circuit, and the tranformer is so proportioned that the sum of the direct and alternating voltages gives the required striking voltage. The alternating current is controlled by a small contactor switch which may be actuated either by a solenoid or by means of the magnetic leakage of the transformers or of an additional reactance. As soon as the arc has been struck the contactor switch opens the primary circuit of the transformer, and the welder is then supplied direct from the low voltage dynamo. When the weld is completed or the arc broken, the contactor switch automatically closes and the electrode volts rise to 60–65 ready for the arc to be struck again. The circuit supplying current to each welder is supplied with its own contactor switch, so that each operator is quite independent. In addition to the reactance a small welder's resistance is placed in each circuit to provide for independent adjustment of current according to the size of electrodes being used.

In The Electrician of April 12th we described the series of oil-immersed starters for squirrel-cage motors put on the market by The English Electric Co., Ltd., Queen's House Kingsway, London, W.C.2. The company has now introduced a line of oil-immersed stator-rotor starters for slip-ring motors, known as "Class OSR." The starters are ironclad and weatherproof, and suitable for floor or wall mounting. Starting and protection are catered for by one complete unit. A handwheel operates both the stator switch and the rotor drum, whilst the handwheel cannot be left in any position between "off" and "full on," at the same time complete "free-handle" freedom is provided for releases to operate in any position required. Interlocking with slip-ring short circuiting gear can be fitted if required. A large opening in the right-hand side of the starter is ordinarily covered by a steel plate with three wood bushes for cables. The bushes can be replaced by conduit glands when required. For use with armoured cable a special box with openings on all sides is fitted over the steel plate. The necessary bonding glands can be secured to any of the openings, the remaining apertures being covered by steel plates. The box has filling plugs for use when it is desired to seal the cable ends. The main advantages of the arrangement for cables are that the cable can be led to the starter from what is determined—after the starter is on site—to be the most convenient direction, and that it is not necessary to fix cable sizes before delivery of the starter.

The London Electric Firm, Brighton Road, Croydon, has introduced a small searchlight projector mounted on a tripod with extensible legs which is for use in prospecting work in connection with mining. It will be noticed, from our illustration, that tilting and training motions are provided, the manipulation being facile. The tripod is very rigid and will extend sufficiently to bring the centre of the light just over 6 ft. from ground level. The lamp is arranged for taking 12/14 V bulbs fed from a small accumulator in wood case, and the equipment can be carried by one man.

The "Helsby" twin wiring system is dealt with in a new brochure published by British Insulated Cables, Ltd., Prescot, Lancs. Leaflet P.F. 57, devoted to "Prescot" lead joint boxes, and replacing P. 233, has also been published. Another new issue is H. 117, describing Leclanché batteries and replacing H. 89.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, where available.

AYRSHIRE EDUCATION COMMITTEE.—Electrical work in connection with new school at Heathfield, Ayr. Particulars from Mr. William Reid, Education Offices, Ayr.

BRIGHTON CORPORATION, October 11th.—Supply of gas-filled lamps, for street lighting, for one year. Specification, etc., from the Engineer and Manager, Electricity Works, North Road, Brighton.

SALTCOATS CORPORATION, October 11th.—Electric light installations in 16 houses on Canal Bank, Canal Street, and 20 at Guthrie Road. Schedule (No. 7) from Messrs. Hugh Thomson and Sons, 60, Hamilton Street, Saltcoats.

STOKE-ON-TRENT CORPORATION, October 11th.—Electric light wiring and fittings, etc., in 65 houses on Vivian Road housing site, Fenton. Particulars from the City Surveyor, Town Hall, Stoke-on-Trent; deposit £1.

Church Lighting in Wales.

ST. MARY'S CHURCH, YSCEIFIOG, HOLYWELL, October 12th.—Electric light installation. Particulars from the Rev. T. Richards, The Rectory, Ysceifiog, near Holywell.

CARLISLE EDUCATION COMMITTEE, October 14th.—Electric light installation in Open Air School, Newtown. Specifications can be seen at the office of the Surveyor, 18, Fisher Street, Carlisle.

CLUTTON GUARDIANS, October 14th.—Electric light installation at the Institution. Specifications, etc., from Mr. J. Wayne Morgan, 9, Mount Stuart Square, Cardiff; deposit £2 2s.

EDINBURGH PARISH COUNCIL, October 14th.—Electric light and power installations at Craigleith Hospital. Schedules from Mr. J. M. Johnston, 47, Charlotte Street, Leith.

SHEFFIELD CORPORATION, October 14th.—Maintenance of private telephone and bell installations at the Lodge Moor, Winter Street, Crimicar Lane and Commonside Hospitals for 12 months. Form of tender from the Clerk and Steward, Lodge Moor Hospital.

MANCHESTER GUARDIANS, October 15th.—Supply of electric lamps. Forms of tender from the clerk, Mr. F. W. Greenhalgh, Union Offices, All Saints', Manchester.

BELFAST CORPORATION, October 21st.—Supply of circulating water pipes, for the electricity department. Specification (W.97) from Mr. F. H. Whysall, city electrical engineer and general manager, East Bridge Street, Belfast; deposit, £2 2s.

CARDIFF CORPORATION, October 21st.—Supply and erection of (1) water-tube boiler and mechanical stokers; and (2) fuel economiser. Specification, etc., from the City Electrical Engineer, Central Offices, The Hayes, Cardiff. Only contractors on the King's National Roll are invited to tender.

GLASGOW PARISH COUNCIL AND DISTRICT BOARD OF CONTROL, October 21st.—Six months' supply of electrical fittings to the institutions and offices. Form of tender (No. 62) from Mr. M. A. Reynard, inspector and clerk, 266, George Street, Glasgow, C.1.

STAINES RURAL DISTRICT COUNCIL, October 21st.—Construction of sewers and electrical and other equipment for pumping stations. Specification, etc., from the Engineer, Council Offices, London Road, Ashford, Middlesex.

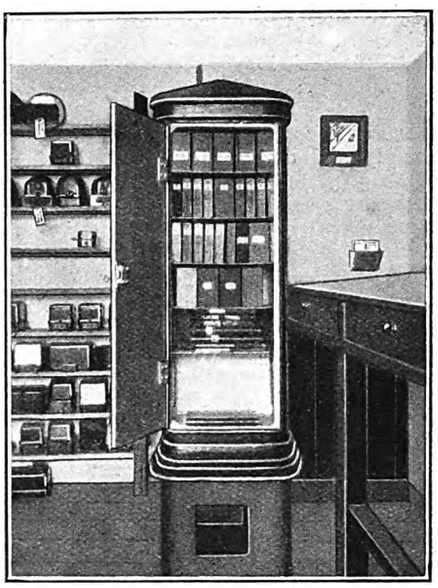
CLACKMANNAN MATERNITY AND CHILD WELFARE COMMITTEE, October 22nd.—Electrical installation in connection with additions and alterations at Alloa Day Nursery. Tenders to Mr. J. Reed, 2, Candleriggs, Alloa.

COMMISSIONERS OF HIS MAJESTY'S WORKS, ETC., October 22nd.—Supply of electric cable and wire. Forms of tender, etc., from the Controller of Supplies, H.M. Office of Works, etc., King Charles Street, Westminster, London, S.W.1.

SOUTHWARK (LONDON) BOROUGH COUNCIL, October 22nd.—Twelve months' supply of electric cables. Further particulars from the Electrical Engineer, Penrose Street, Walworth Road, London, S.E.17.

HASTINGS CORPORATION, October 23rd.—(*a*) 22 000 V, three-phase overhead lines and underground cables, Crowhurst section, No. 7 (about 7 000 yds.); (*b*) 400 V, three-phase, 4-wire, overhead lines and underground cable, Crowhurst section, No. 7 (about 4 200 yds.); (*c*) 400 V, three-phase, 4-wire, overhead lines and underground cable, Whatlington Road section, No. 8 (about 1 000 yds.). Specifications (deposit £1 1s. for each) from Mr. A. J. Ryan, borough electrical engineer.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, October 25th.—One 130 ton, 4-motor, electric, engine room crane, one 15-ton 3-motor, electric, auxiliary bay crane, and one 10 ton, 3-motor, circulating pump house crane, at Ironbridge power station. Specification (No. 6) from Mr. E. F. Hetherington, chief engineer and manager; deposit £1 1s.



ACCORDING to Mr. T. S. Shenton, chief engineer of the Rugby Electricity Department, this "Henley" pillar was in use on a 2 000 V feeder system 26 years ago, and, after having served its purpose on the mains, is now doing excellent service in the meter room as a fireproof cupboard for the meter books. As may be seen from the photograph, it has been fitted with iron shelves. The bottom is filled in with 3 in. of granolithic concrete, and the ventilating space between the dome top and the pillar walls is packed with asbestos yarn.

STAFFORDSHIRE EDUCATION COMMITTEE, October 31st.—Electric light installation in two new elementary day schools in Brettell Lane, Brierley Hill. Specification from Messrs. Moffett, Rosher and Mann, Union Chambers, Temple Row, Birmingham; deposit £5 5s.

CENTRAL ELECTRICITY BOARD, November 9th.—Supply and erection of overhead 33 000 V transmission lines in South Lincolnshire, in connection with Mid-East England scheme. Specification (No. M.E.E.—S.L.1) from Mr. R. H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, Charing Cross, London, W.C.2; deposit £2 2s.

EAST RETFORD CORPORATION, November 19th.—Electrically driven centrifugal borehole pump (60,000 gall. per hour). Specification from Mr. S. O. Pacey, Gas and Water Electricity Offices, East Retford; deposit £2 2s.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

SOUTH INDIAN RAILWAY CO., LTD., October 11th.—Overhead contact and distribution lines, in connection with electrification of Madras suburban services. Specifications (10s.) from the company's offices, 91, Petty France, Westminster, S.W.1.

EGYPTIAN MINISTRY OF THE INTERIOR, October 15th (extension of time).—Erection and equipment of electric power station (about 500 kVA), with overhead and underground networks, for the town of Menouf. (Reference B. 5 674.)

NEW ZEALAND POSTS AND TELEGRAPHS, October 15th.—Supply of B.P.O. type resistances. (No. P. and T., 151/1 712.)

NEW ZEALAND POSTS AND TELEGRAPHS, October 15th.—Condensers (P. and T. 151/1 733). (Reference B.X. 5 602.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, October 15th.—Seven 5 500 kVA single-phase auto-transformers, with accessories, for Waitaki power scheme. (Reference B.X. 5 417.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, October 15th.—Switchboard instruments, test plugs and sleeves (schedule C. 472). (Reference B.X. 5 541.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE.—October 15th.—Telephone jacks (schedule No. C. 488). (Reference B.X. 5,695.)

WELLINGTON POSTS AND TELEGRAPHS DEPARTMENT, October 15th.—Supply and delivery of B.P.O. type resistances. (Reference B.X. 5 551.)

WELLINGTON POSTS AND TELEGRAPHS DEPARTMENT, October 15th.—Supply and delivery of B.P.O. type retardation coils. (Reference B.X. 5 552.)

CAPE TOWN MUNICIPALITY, October 16th.—Supply of paper insulated cables (specification No. 474). (Reference B.X. 5 640.)

EGYPTIAN MINISTRY OF THE INTERIOR, October 16th.—Electric motors, pumps, filters, and artesian well. (Reference A.X. 8 373.)

NEW ZEALAND POSTS AND TELEGRAPHS, October 16th.—Automatic wall and table telephones. (Reference B.X. 5 509.)

NEW ZEALAND POSTS AND TELEGRAPHS, October 16th.—Automatic telephone dials (P. and T. 151/1 734.) (Reference 5 605.)

JOHANNESBURG MUNICIPALITY, October 17th.—Tramcar motors (contract No. 253). (Reference B.X. 5 664.)

SALISBURY (S. RHODESIA) MUNICIPALITY, October 17th.—Turbo-alternators, steam piping, crane and switchgear (contract 52). (Reference B.X. 5 607.)

SALISBURY (S. RHODESIA) MUNICIPALITY, October 17th.—Supply of h.t. cables, transformers and sundries, in connection with extensions of the electricity undertaking (contract 53). (Reference B.X. 5 604.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, October 17th.—One 10-ton electric overhead travelling crane (tender No. 1 533) (Reference A.X. 8 463.)

ROUMANIAN GENERAL POST OFFICE, October 18th.—Supply of 31 500 kilos of 3 mm. h.d. copper wire. (Reference A.X. 8 551.)

NEW ZEALAND POSTS AND TELEGRAPHS, October 21st.—Supply of switchboard cords (P. and T. No. 151/1813). (Reference B.X. 5 715.)

WELLINGTON CORPORATION, October 21st.—High and low tension switchgear (contract No. 449). (Reference B.X. 5 649.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, October 22nd.—Supply of insulated wire (schedule C. 475). (Reference B.X. 5 580.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, October 22nd.—Telephone transformers (schedule C. 474). Reference BX. 5 581.)

VICTORIAN RAILWAY COMMISSION, October 23rd.—Dry-core telephone cable (contract No. 43 384). (Reference B.X. 5 638.)

JOHANNESBURG MUNICIPALITY, October 26th.—Supply of time switches, with automatic astronomical dial, electrical operation and winding, for street lighting use (contract No. 263). (Reference B.X. 5 709.)

JOHANNESBURG MUNICIPALITY, October 26th.—Three-phase, 6 600 V, draw-out truck type switchboard panels, suitable for installation as single panels or coupled to form a multiple panel switchboard (contract No. 262). (Reference B.X. 5 710.)

DUBLIN UNITED TRAMWAYS CO. (1896), LTD., October 28th.—Twelve months' supply of electric lamps and fittings, etc. Forms of tender (2s. 6d.) from the Company's Offices, 59, Upper O'Connell Street, Dublin.

NEW SOUTH WALES GOVERNMENT RAILWAYS, October 29th.—Railway traction motor testing equipment, comprising electric motor, booster, main field excitation generator and short field exciter (quotation No. B.E. 508). (Reference B.X. 5 693.)

MELBOURNE CITY COUNCIL, October 30th.—Two 2 500 kW motor-convertors and accessories, or two 2 500 kW rotary

LIGHT ALLOYS.

THESE illustrations, reproduced from "Light Alloys in Industry," by courtesy of the British Aluminium Co., Ltd., show interesting electrical applications of these alloys. convertors, with transformers and accessories. (Reference B.X. 5 570.)

NEW ZEALAND POSTS AND TELEGRAPHS, October 30th.—Head receivers (P. and T. 151/1/725.) (Reference V.X. 5 603.)

JOHANNESBURG MUNICIPALITY, October 31st.—Outdoor type 3-phase and single-phase transformers (contract No. 266). (Reference B.X. 5 736.)

AUCKLAND ELECTRIC POWER BOARD, November 4th.—Distribution pillar shells and link units and cable sealing ends. (Reference B.X. 5 682.)

AUCKLAND ELECTRIC POWER BOARD, November 4th.—Low tension porcelain insulators, etc. (Reference B.X. 5 648.)

EGYPTIAN DEPARTMENT OF PUBLIC HEALTH, November 5th.—Twelve months' supply of electrical refrigerators.

NEW ZEALAND POSTS AND TELEGRAPHS, November 12th.—Four-conductor telephone operators' cords. (Reference B.X. 5 685.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, November 12th.—Supply of 15 kW generating set for installation on the "Maui Pomare" (tender No. 369). (Reference B.X. 5 683.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, November 12th.—Transmitters and associated parts (schedule C. 477). (Reference B.X. 5 653.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, November 12th.—Receivers and associated parts (schedule C. 477). (Reference B.X. 5 656.)

SOUTH AFRICAN POSTS AND TELEGRAPHS, November 14th.—Supply of 400 000 lb. of hard drawn copper wire, 2 000 lb. of soft drawn copper wire and 2 000 lb. of soft drawn tinned copper wire (tender No. 173). (Reference A.X. 8 510.)

NEW ZEALAND POSTS AND TELEGRAPHS, November 18th.—Resistance spools (P. and T. 151/1832). (Reference B.X. 5 716.)

EGYPTIAN MINISTRY OF THE INTERIOR, November 19th.—Supply of 160 H.P. Diesel-electric generating set for Manfalout power station (Assiut Province). (Reference B.X. 5 720.)

NEW ZEALAND POSTS AND TELEGRAPHS, November 19th.—Telephone transformers (P. and T. No. 151/1807). (Reference B.X. 5 718.)

NEW ZEALAND POSTS AND TELEGRAPHS, November 19th.—Automatic wall and table telephones (P. and T. No. 151/1825). (Reference B.X. 5 717.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, November 19th.—Supply of telephone generators and motor generators (schedule No. C. 479). (Reference B.X. 5 662.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, November 19th.—Motor generators (schedule C. 486). (Reference B.X. 5 694.)

MELBOURNE CITY COUNCIL, November 27th.—Totally-enclosed, metal-clad, 6 000 V, three-phase switchgear (specification No. 1 000). (Reference B.X. 5 708.)

MELBOURNE CITY COUNCIL, November 27th.—Supply of 600 V d.c. switchgear (specification No. 1 001). (Reference B.X. 5 734.)

VICTORIAN RAILWAY COMMISSION, November 27th.—Supply of automatic oil switches (contract No. 43 411). (Reference B.X. 5 735.)

WESTERN AUSTRALIA GOVERNMENT, November 29th.—Supply and erection at Perth of (*a*) boiler house equipment, and (*b*) 12 500 kW turbo-generator and condensing plant. Specifications (£1 1s. for each; not returnable) from the Agent-General for Western Australia, Savoy House, Strand, London, W.C.2.

INDIAN STORES DEPARTMENT, December 3rd.—Ceiling and table fans. (Reference B.X. 5 672.)

VICTORIAN ELECTRICITY COMMISSION, December 16th.—Oscillographic equipment (specification No. 29/115). (Reference B.X. 5 692.)

Tenders Accepted.

HOLYWOOD COUNCIL.—Johnson and Phillips, Ltd., cable and transmission line work.

WAR OFFICE.—Edison Swan Electric Co., Ltd., supply of vacuum and gasfilled lamps.

H.M. OFFICE OF WORKS.—R. Langston, Jones and Co., wiring Ministry of Labour Training College, Slough.

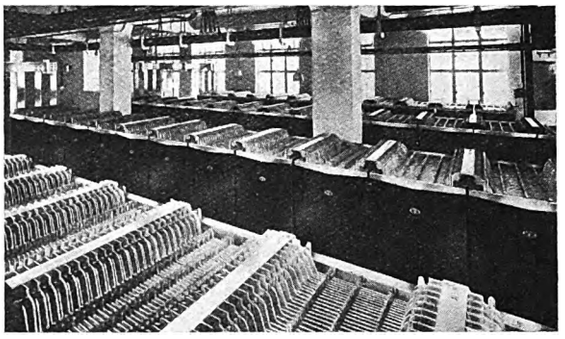
H.M. OFFICE OF WORKS, ETC.—Supply, etc., of switchgear: National Physical Laboratory, English Electric Co., Ltd.

RUGBY URBAN DISTRICT COUNCIL.—W. T. Henley's Telegraph Works, Ltd., cable, etc., for Barby Road, extension, £1 068 10s.

BATTERSEA (LONDON) BOROUGH COUNCIL.—Babcock and Wilcox, Ltd., "Bailey" cooling walls for two boilers, £2 500. (Recommended).

LONDON COUNTY COUNCIL.—Metropolitan-Vickers Electrical Co., Ltd., one rotary convertor, with supervisory control at tramway sub-stations, £5 568.

BARKING URBAN DISTRICT COUNCIL.—Siemens Bros. and Co., Ltd., supply and laying of cable from Axe Street to sewage works, £2 779 3s. (Recommended.)



THE "Alton" batteries at the National automatic telephone exchange which was recently cut into commission. *See paragraph on page* 434.

IRISH FREE STATE DEPARTMENT OF LOCAL GOVERNMENT.—Sphinx Electric Supplies (Ireland), supply of street, house lighting and automobile lamps for 1929–1930.

STOKE-ON-TRENT CORPORATION.—J. H. Bates and Son, electric wiring of St. Paul's Church clock, Burslem, £4 15s., and supply of automatic time switch, £7 10s.

LEICESTER CORPORATION.—Electric Construction Co., Ltd., supply and erection of rotary convertors, transformers, control gear, etc., at Lero power station, £4 198 10s.

MARKET DRAYTON URBAN DISTRICT COUNCIL.—Market Drayton Electric Light Co., public lighting by 100 or more lamps from September to April next, £3 10s. per lamp.

MAIDENHEAD CORPORATION.—Hewittic Electric Co., Ltd., rectifier plant for sub-station, £1 231 10s.; Drake and Gorham (Wholesale), Ltd., extra high pressure switchgear, £68.

BRADFORD CORPORATION.—Electrical improvements at Kirkgate market, £295 15s., plus 10% for departmental charges and £196 for fittings.

SALFORD CORPORATION.—E. M. Evans and Sons, Ltd., maintenance of intercommunication telephones in Town Hall and Education Offices, for 5 years, £90. (Recommended).

MAIDSTONE EDUCATION COMMITTEE.—Corporation Electricity Department, electric light installation at Union Street School, £90. Five tenders received; highest £202 11s.

KILKENNY COUNTY COUNCIL.—M. E. Kent, electric lighting and heating of Thomastown courthouse; Keatinge and Gaule, electric lighting and heating of Callan courthouse.

EPSOM GUARDIANS.—Alpha Manufacturing and Electrical Co., for electric light installation in a portion of the Institution, including board room, chapel, dining hall, and kitchen, £114.

LEEDS CORPORATION.—Cables: W. T. Henley's Telegraph Works Co., Ltd., £2 015; Enfield Cable Works, Ltd., £2 718; Macintosh Cable Co., Ltd., £3 090; Hackbridge Cable Co., Ltd., £687.

IRISH FREE STATE DEPARTMENT OF LOCAL GOVERNMENT.—Siemens Electric Lamps and Supplies, Ltd. (Dublin Branch), six months' supply of Siemens' standard lighting lamps and automobile type lamps.

CENTRAL ELECTRICITY BOARD.—Tees Bridge and Engineering Co., Ltd., manufacture and galvanising of the whole of the steel structural work (about 6 000 tons) in connection with Mid-East England electricity scheme.

KETTERING URBAN DISTRICT COUNCIL.—Works and supplies in connection with supply to Pytchley and Warkton: Gabriel, Wade and English, poles, £206; British Electric Transformer Co., Ltd., two transformers £132.

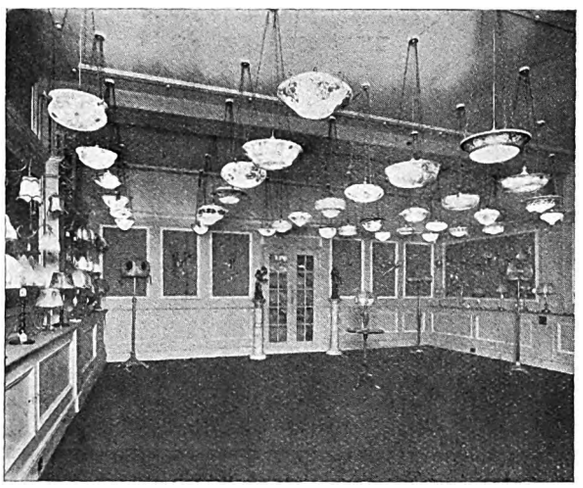
WICKLOW URBAN DISTRICT COUNCIL.—I.F.S. Electricity Supply Board, public lighting of town for current season, £205. Wicklow Gas Co. tendered for 3 years at £150 p.a., two years at £170; to March 31st next at £220.

BARKING URBAN DISTRICT COUNCIL.—New Switchgear Co., Ltd., two truck-type cubicles for Upney sub-station,

Digitized by Google

£176, and two for the works of Warne and Co., £176; Siemens Bros. and Co., Ltd., 3 300 yds. of cable for public lighting at the bye-pass road.

INDIAN STORES DEPARTMENT.—Greaves, Cotton and Co., generating set, R. 6 850; General Electric Co. (India), Ltd., ceiling fans, R. 2 658, and meters R. 1 326; W. T. Henley's Telegraph Works Co., Ltd., cables, R. 1 571; Siemens (India), Ltd., meters, R. 1 022.



A GENERAL view of the lighting fittings showrooms of Lighting Trades, Ltd., at Oriel House, Farringdon Street, London, E.C.4. *See paragraph on page 434.*

STOKE-ON-TRENT CORPORATION.—E. Green and Co., Ltd., replacement of two economisers for water tube boilers at central power house, £5 262. Stirling Boiler Co., Ltd., replacement of four superheaters for water tube boilers at central power house, £1 243.

GENERAL POST OFFICE.—Batteries: Blackburn Telephone Exchange, Chloride Electrical Storage Co., Ltd.; Radio Equipment, London Repeater Station, Standard Telephones and Cables, Ltd.; Telephone Exchange Equipment, Hounslow, Automatic Telephone Mfg. Co., Ltd.

GENERAL POST OFFICE.—Electric lighting—Paddington District Post Office, Alpha Mfg. and Electrical Co., Ltd.; telephone exchange equipment—Scotstoun (Glasgow), Ericsson Telephones, Ltd.; Wembley, Automatic Telephone Mfg. Co., Ltd.; Whitehall, Siemens Bros. and Co., Ltd.

LIVERPOOL CORPORATION.—Tramway special trackwork: Parker Street and Church Street Junction, E. Allen and Co., Ltd., £1 530; Castle Street and Water Street Junction, Edgar Allen and Co., Ltd., £1 270; Church Street and Lord Street intersection, Titan Trackwork Co., Ltd., £580. (All recommended.)

MANCHESTER EDUCATION COMMITTEE.—Mather and Platt, Ltd., motor generator; and Albert Loudon, electric light installation at Central High School for Boys; John Adams, Ltd., electric lighting installation at Cooke Street domestic centre; Jackson Electric Stove Co., Ltd., electric cooker for Soss Moss Special School.

BRADFORD CORPORATION.—A. Reyrolle and Co., Ltd., earthing resistance, for generator at Valley Road power station; British Thomson-Houston Co., Ltd., six sets of current-limiting reactors, for Valley Road power station; H. Taylor and Co., Ltd., electric lighting at Bolling Hall school. £836. (All recommended.)

MARYLEBONE (LONDON) BOROUGH COUNCIL.—Metropolitan-Vickers Electrical Co., Ltd., and British Electric Transformer Co., Ltd., 12 months' supply of transformers; A. Reyrolle and Co., Ltd., 12 months' supply of switchgear; Chamberlain and Hookham, Ltd., and Ferranti, Ltd., 12 months' supply of meters. (All recommended.)

ROTHERHAM CORPORATION.—Callender's Cable and Construction Co., Ltd., supply of 4 000 yds. of e.h.t. cable, £3 149 19s. Heating at High School for Girls: Young, Osmond and Young, Ltd., Unity tubular electric heaters, £70 2s. 3d.; Ibbotson Bros. (Rotherham), Ltd., wiring and installation, £22. (All recommended.)

MANCHESTER CORPORATION.—Metropolitan-Vickers Electrical Co., Ltd., supply of 5 kW motor-generator, with control gear; Callender's Cable and Construction Co., Ltd., maintenance of 33 kV feeder cables; Metropolitan-Vickers Electrical Co., Ltd., supply of supervisory control gear; Alfred Herbert, Ltd., pulverised fuel boosting plant at Stuart Street Station.

BARKING URBAN DISTRICT COUNCIL.—A.C.E.C., supply of cable, £1 809. (Recommended.) Also tendered: Power and Lighting Cables, Ltd., £1 953; Enfield Cable Co., Ltd., £2 035; W. T. Glover and Co., Ltd., £2 066; Callender's Cable and Construction Co., £2 071; Hackbridge Cable Co., Ltd., £2 075; Pirelli-General Cable Works, Ltd., £2 075; Siemens Bros. and Co., Ltd., £2 096; Union Cable Co., Ltd., £2 101; Standard Telephones and Cables Co., Ltd., £2 109; Johnson and Phillips, Ltd., £2 116; W. T. Henley's Telegraph Works Co., Ltd., £2 120.

WEST HAM CORPORATION.—Harland and Wolff, Ltd., electric lighting of Plaistow Secondary School extension, £570. (Recommended). Also tendered: Telephone and Electrical Maintenance Co., £1 185; General Electrical Maintenance Co., £1 138; Rely A. Bell Co., £1 047; Distributors (British Electrical), Ltd., £870; West Ham Corporation Electricity Department, £800; General Installation Co., Ltd., £775; "Servu" (Cameron and Graves), £740; S. Taylor and Sons, £725; Alpha Mfg. and Electrical Co., Ltd., £688; M. J. T. Thomas and Co., £665; C. H. Simmonds, £660.

LONDON COUNTY COUNCIL.—British Thomson-Houston Co., Ltd., supply and installation of eight rotary convertors at tramways sub-stations, £23 902 (accepted in part); Metropolitan-Vickers Electrical Co., Ltd., £23 802 (accepted in part). Also tendered: Bruce Peebles and Co., Ltd., £23 802; English Electric Co., Ltd., £23 802; General Electric Co., Ltd., £23 802; Mather and Platt, Ltd., £23 802; A. Reyrolle and Co., Ltd., £23 802; Electric Construction Co., Ltd., £24 090; Crompton Parkinson, Ltd., £26 242; Oerlikon, Ltd., £27 526; (alternative), £29 530; Harland Engineering Co., Ltd., £28 041; Electric Motor and Transformer Co., £29 582; British Brown-Boveri, Ltd., £34 152; Hewittic Electric Co., Ltd., £39 084. Two last mentioned tendered for mercury arc rectifiers.

HESTON AND ISLEWORTH URBAN DISTRICT COUNCIL.—Supply of cables: Enfield Cable Works, Ltd., 0·01 sq. in. twin, 5 000 yds., £575; 0·0145 sq. in. four core, 1 000 yds, £208; 0·15 by 0·08 by 0·15 three-core, 1 500 yds, £810; 0·05 sq. in single, 1 400 yds., £233; 0·8 sq. in. single, 700 yds., £81. (Recommended.) Also tendered: Pirelli General Cable Works, Ltd., £583, £211, £825, £235 and £82; Macintosh Cable Co., Ltd., £584, £212, £823, £238 and £82; Callender's Cable and Construction Co., Ltd., £588, £212, £827, £239 and £82; Siemens Bros. and Co., Ltd., £592 £214, £834, £240 and £83; Union Cable Co., Ltd., £594, £215, £836, £241 and £84; British Insulated Cables, Ltd., £595, £215, £836, £241 and £84; W. T. Glover and Co., Ltd., £600, £217, £845, £244 and £85; W. T. Henley's Telegraph Works Co., Ltd., £600, £216, £847, £245 and £84.

GLASGOW CORPORATION.—T. B. and J. A. Mathieson, Ltd., electrical work at new baths and washhouses; Fraser and Bothwick, Ltd., additional battery charging plant at refuse destructor garage, Govan, £19 443, and overhead charging feeder system, £349; A. Anderson, Ltd., ground lighting installation at Mearnskirk Sanatorium, £3 358 (subject to £101 included for day work and contingencies). Electric wiring in connection with housing schemes. Shettleston and Tollcross, R. J. M'Intyre, £396; Saracen Street, No. 2, R. J. M'Intyre, £809; Quarrybrae Street, R. J. M'Intyre, £1 355; Altyre Street, D. Henderson, £651. Manganese steel points, Edgar Allen and Co., Ltd.; pinions for 49b. equipments, W. C. Yuille and Co., Ltd.; ⅝ in. insulated bolts, British Insulated Cables Ltd.; storage battery for Bearsden sub-station, Hart Accumulator Co., Ltd.; armature coils, Dyer and Young, Ltd.; wire, Callender's Cable and Construction Co., Ltd.; car seats (150 sets), Bennet Furnishing Co., Ltd.

NEW ANGLO-BELGIAN CABLE.

Important Order for British Manufacturers.

We understand that Siemens Brothers and Co., Ltd., Woolwich, have received an order for a duplicate of the Anglo-Belgian telephone cable which they made and laid in 1926. The new cable will be of the 7-quad type, and the route will be Canterbury and Dumpton Gap to La Panne.

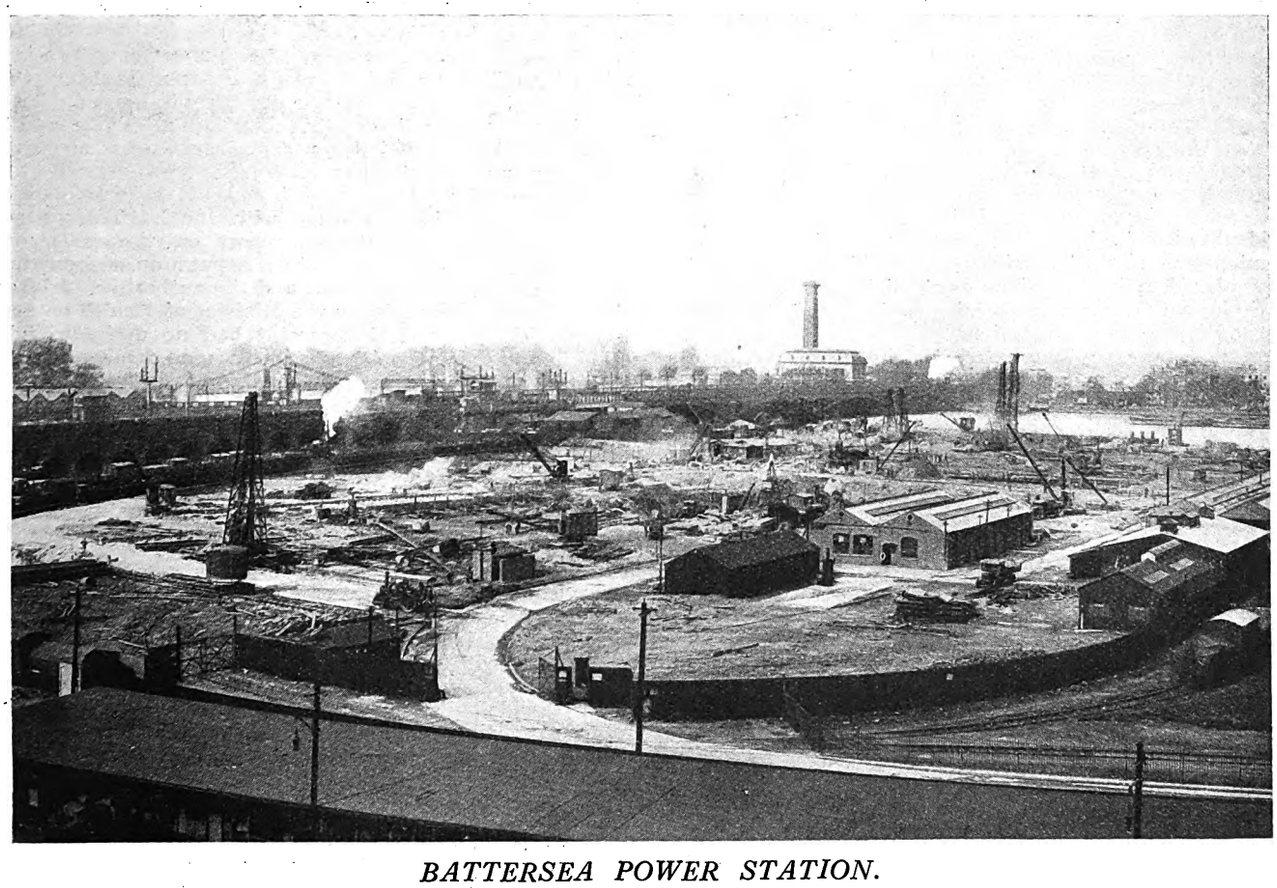
Digitized by Google

ELECTRICAL INVENTIONS.

Some of the Novelties Shown at the Exhibition of Inventions.

THE exhibits at the fifth International Exhibition of Inventions, which was opened by Lord Askwith, president of the Institute of Patentees (the promoters of the exhibition), last week, at the Central Hall, Westminster, are more numerous than on any former occasion, and while mainly British, include inventions which have come from the United States, several European countries and China. The following are amongst the new inventions: An electric iron, incorporating an audible warning device, consisting of a buzzer which continues to buzz while the current is on and the iron is not in use. It can be connected to a lampholder or wall plug in the ordinary way and the additional current consumption is said to be almost negligible when compared with similar irons of ordinary type, while a fault in the buzzer does not affect the use of the iron (catalogue No. 121). An electric iron which switches off automatically if left unattended in the ironing position (No. 141). A motor-car clock, incorporating an automatic lighting switch, is also shown, and this can be set to operate the lighting system of a car at any desired time, e.g., during the driver's absence (No. 213). An electrical device to cut off the magneto of a motor vehicle and operate an alarm if an unauthorised person attempts to start the engine (No. 243). Another device to prevent motor-car stealing cuts off the petrol supply and self-starter. Movement of the latter or release of the brake sets the horn sounding (No. 277). Immersion heater for motor car radiators (No. 282). Combined loud speaker and reading lamp. The loud speaker is over the lamp, in the shade (No. 304). Device, involving the use of Neon lamps, to indicate when current is flowing in a circuit (No. 306). Private portable telephone which can be used on the house bell wiring system (No. 307). Automatic electric lock. This works on an ordinary 2V battery, and is very simple in construction, the bolt being held in position by a canted lever operated by two springs (No. 308). Electric lamp locking device (No. 310). Improvements in thermionic valve circuits (No. 311). Door bolt opened electrically. This can be operated from a distance, and a bell is rung at the same time if desired (No. 412). Door bolt operated either in the ordinary way, or electrically by means of switch or push button (No. 414). A hand egg tester. This consists of small electric lamps held between the fingers. Mr. Donald J. Cook, of Holt, Norfolk, is the patentee (No. 520). Desk or table appliance for lighting cigars, cigarettes, etc., adaptable for battery and coil or magneto ignition (No. 523). Device for holding telephone earpiece, leaving the hands free (No. 543).

In the trade section, the exhibitors include Four-Edge Safety Razors, 24, John William Street, Huddersfield, who show electric lamp locks; St. James's Electrical Co., 20, St. James's Square, London, S.W.1, electric mains, bells for fire alarms, etc.; Tellus Super Vacuum Cleaner, Ltd., 68, Victoria Street, London, S.W.1, vacuum cleaners of various sizes of the "non-bag" type. Model M, for household use, has a loading of 113·5 W; G. S. Walliker and Son, 22, Aeroville, Booth Road, Hendon, illuminated advertising letters and pictorial signs; Illuminated Road Signs, Windsor House, Victoria Street, London, S.W.1, traffic control and other signs; W. R. Patents, Ltd., Great Wilson Street, Leeds, "Ringrose" gas operated electric cut-outs, and system of electric lighting for gassy mines; O. Overbeck, Chantry House, Deansgate, Grimsby, medical electrical instruments for home use; Neophone Engineering Co., 9 and 10, Little St. Andrew Street, St. Martin's Lane, London, W.C.2, seamless vulcanite core diaphragms for wireless loud speakers. These are said to contain 70% pure rubber; Southend and District Light Supply Co., Ltd., 217, London Road, Southend, S.O.S. safe alarm. An important feature of this is a metal ball which is placed on a cone in a chamber at the top of the cabinet. When the ball is dislodged by any movement and touches contacts fitted around the inside of the chamber, a bell rings continuously.



BATTERSEA POWER STATION.

A GENERAL view of the site of the much criticised power station of the London Power Company at Battersea, taken from the south side looking across the Thames. The station was approved and selected by the Central Electricity Board in 1928, as an integral feature of the adopted South East England Electricity Scheme. In spite of the assurances given by the Power Company, and published in THE ELECTRICIAN *of May 17th last, that the station will incorporate new methods of flue gas treatment, opposition is still being put forward by the Westminster City Council and others, on the ground that the emission of sulphur fumes would be a danger to public health. Meanwhile, as the picture shows, the work of erection is being continued.*

ELECTRICITY SUPPLY.

Bermondsey's New Power Station—Lancaster's Extended Supply Area—Assisted Wiring at Portland—Cheap Supply for Potteries—Boston and District Extensions—The Battersea Power Station—Marylebone Plant Extension.

BARKING U.D.C. seeks sanction to borrow £2 682 for wiring houses on the Eastbury Estate.

The supply at Hungerford has been switched over to the bulk supply of the Wessex Electricity Co.

Portsmouth Corporation is seeking an Order to authorise a supply of electricity for the parish of Hambledon.

Carlisle R.D.C. has given consent to a Special Order applied for by the City Council to supply the area of the R.D.C.

Cannock U.D.C. is to spend £1 086 upon cable extensions and street lamps at Pye Green and Old Hednesford Road.

The Central Electricity Board has purchased from Leicester Corporation a site of about an acre for the erection of a station.

Kingston-on-Thames T.C. has received sanction to a loan of £41 678 for the installation of additional plant.

Scalby and Filey District Councils have intimated to Scarborough T.C. that they will not consent to the erection of overhead lines in their districts.

Retford R.D.C. has declined to consent to the erection of overhead lines in a portion of its area by the Nottinghamshire and Derbyshire Electric Power Co.

Bermondsey (London) Electricity Committee has decided that the official opening of the new power station by the Mayor shall take place on October 26th.

The Electricity Commissioners have suggested to Lancaster Corporation that the proposals for an extension of area of supply should be considerably modified.

Glasgow Corporation proposes to take over from the Clyde Valley Electrical Power Co. the distribution of electricity in the Shettleston and Tolcross area at the end of the present year.

Hastings R.D.C. is to make representations to the T.C. with a view to obtaining a reduction in charges for current outside the borough, which are 8d. for lighting, and 2d. for power.

Birkenhead Electricity Committee is seeking sanction to borrow £2 500 for overhead lines; £4 000 for short lengths of feeders, etc.; £2 000 for sub-station equipment, and £1 500 for small static sub-stations and kiosks.

Chesterfield T.C. has approved a reduction of the charge for current for ordinary lighting to 3¾d. per kWh, bringing the whole of the charges down to pre-war rates.—The mains are to be extended for general supply in the Old Brampton area.

Maidenhead T.C. has given approval to improvements and extensions of the electricity undertaking estimated to cost £8 364. The items include extra high pressure feeder, pilot cable, a brick-built sub-station with a 96 kW rectifier plant, and four steel kiosk stations.

Domestic apparatus connected to the Ilford mains to March 31st, 1929, amounted to nearly 29 000 kW, including cookers, 4 931 kW; irons, 1 868 kW; kettles, 1 440 kW; motors, 6 854 kW; radiators, 11 960 kW; and smaller amounts for various other appliances.

Portland Electricity Committee has fixed the price for electricity at 8d. per kWh for lighting and 3d. for power and other uses. The Committee has decided that where consumers wish to take advantage of the deferred system of payment for wiring they must have a minimum of four points installed. The clerk is to write to wiring contractors asking for prices for wiring, according to a schedule.

Mr. C. H. Yeaman, city electrical engineer, Stoke-on-Trent, reports that five electric kilns are at work, which last year consumed 1 909 256 kWh at an average of 0·409d. per kWh, and that several further kilns are under negotiation.—In the all-electric houses in Avenue Road, Shelton, the average consumption per house has been during the past year, for lighting, 170 kWh, heating and cooking, 5 065, water heating, 3 006, at an average price of 0·71d.

In a recent address to the Cork Rotary Club, Dr. T. A. McLaughlin, managing director of the I.F.S. Electricity Supply Board, said from 65 to 80 million kWh of electricity were being provided by steam, gas or oil engines and used in the towns and villages to which the Shannon supply was being brought. The figure on which the experts based the economy of the Shannon scheme was 110 million kWh. It was quite obvious that the market possibilities far exceeded 110 million.

Leeds Improvement Committee has sanctioned a proposal of the Central Electricity Board to erect overhead cable from Kirkstall station to the city boundary in the direction of Wakefield.—The Electricity Committee recommends application for sanction to borrow £175 000 for services and £50 000 for assisted wiring.—The Health Committee has accepted the offer by the Yorkshire Electric Power Co. for the supply of current to Gateforth Sanatorium.

A public supply of current has recently been commenced in Long Sutton and Sutton Bridge, and the parishes of Fleet and Little Sutton. These districts are supplied from the Mount Bridge power station of the Boston and District Electric Supply Co., Ltd., by means of 11 000 V three-phase overhead lines, extensions from the Boston-Holbeach transmission line. Local distribution is at 400/230 V, 50 cycles. The whole of the public lighting at Holbeach has also been converted to electric, and the company is busy installing services and wiring houses and shops.

Croydon Electricity Committee has decided, in connection with further supplies required at the Post Office exchange and other premises in Surrey Street, to lay a three-phase e.h.t. main from Drummond Road sub-station to Surrey Street sub-station, at a cost of £1 800, including switchgear.—The Committee has obtained sanction to borrow £70 000 for buildings, civil engineering works and a concrete cooling tower, and £200 000 for generating plant.—The Committee recommends a special discount of 33% off the flat rate of 6½d. per kW, in the case of the off-peak demand by places of worship.

Bedford Electricity Committee agreed recently to an extension from Kempston to Wootton Pillinge of the existing 11 000 V supply, by means of an overhead line, to meet an increased demand by the London Brick Co. and Forders, Ltd., and for supply to the intervening rural area. The estimated cost of these works was £4 900. The company has now decided to instal 840 kW of additional plant, and to meet this further increase in the demand it will be necessary to lay a duplicate main from the generating station to Wootton Pillinge, and to provide additional transformers. The committee recommends the necessary works at a cost of £13 400.

The Mayor of Chelsea, as chairman of the special committee appointed in connection with the Battersea power station question, presented a report on the matter to Chelsea B.C. last week. He said a deputation, representing the borough councils concerned and the authorities of Westminster Abbey, were told by the Minister of Health on September 26th that the Government had no desire to take action in any scheme which was likely to do damage but the subject would raise the question of money already spent. Unless they were satisfied, on the advice of their chemists, that danger would be avoided, the scheme would not be proceeded with. The Minister of Transport also said he did not resent the agitation to which the scheme had given rise. He added that consent would not be given for the Fulham station unless the Office of Works and the Electricity Commissioners were satisfied that there would be no danger to health or to the buildings of London.

Marylebone (London) Electricity Committee seeks sanction for a loan of £50 000 for mains and services and transformer stations on consumers' premises.—The Commissioners, after consultation with the Central Electricity Board, have informed Marylebone B.C. that they are given to understand that a possible bulk supply is not at present available for the Council's growing requirements, that it would be prudent to proceed at once with the installation of the 25 000 kW turbo alternator set, etc., and that the Board is prepared to issue a direction in respect of the proposed extensions. The Commissioners have also expressd the hope that the Council will not raise any objection to the attachment to any consent of a condition which would place the Council under obligation to take the best-known precautions for the prevention of the emission of grit, etc., from the station. The Committee does not feel that the Council can take any further action until it has had an opportunity of considering the reports of the experts who have been appointed to advise on the matter.

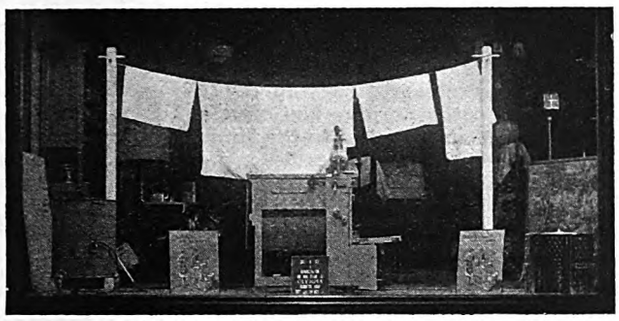
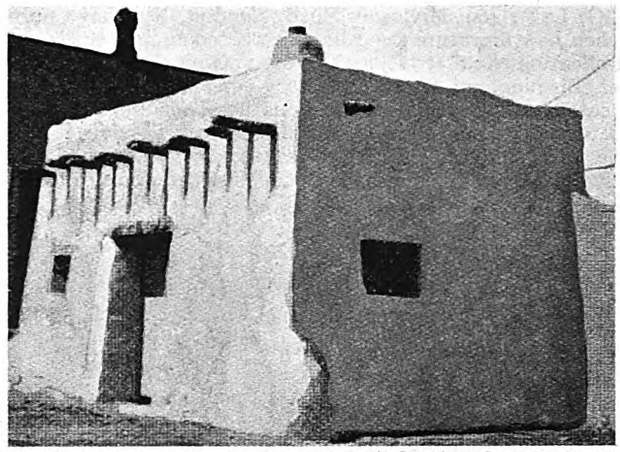
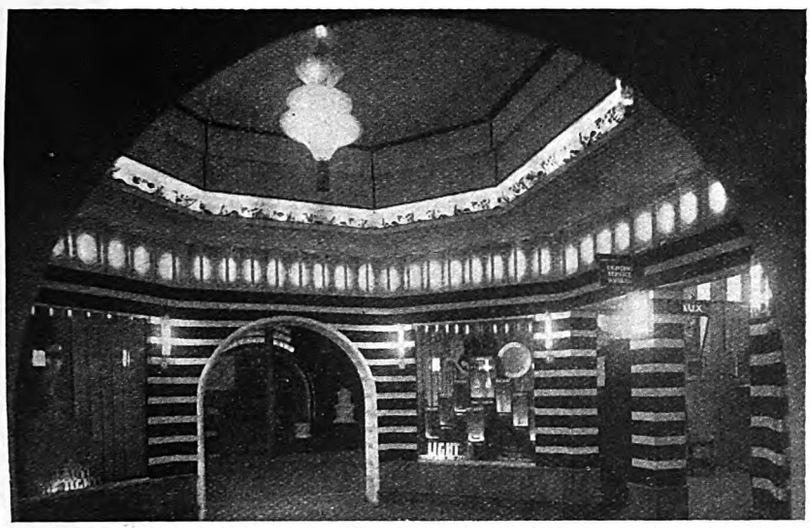
ELECTRICAL NEWS OF THE WEEK IN PICTURES.



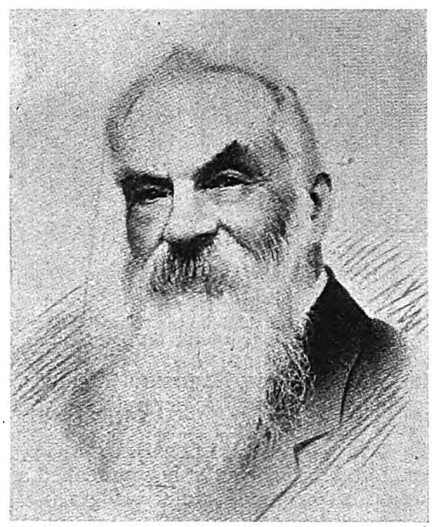
An electric washer display in the window of the Bradford Corporation Electricity Department, with specimens of washed but unironed laundry on a clothes-line between the two posts behind.



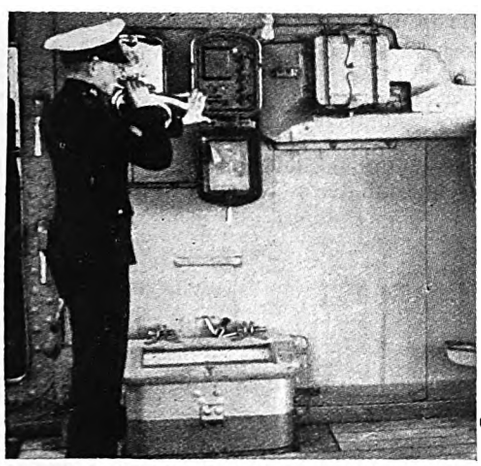
The new Barker sub-station of the Public Services Co. of Colorado presents the novel architectural idea shown above and follows studies of Indian pueblos in New Mexico and Arizona. Instead of a lawn, the building will be surrounded with specially planted desert vegetation. (Photo: "Electrical World.")



This general view of the Hall of Light of the Electric Lamp Manufacturers' Association at the North-East Coast Exhibition serves to remind us that the exhibition will close on October 26th, after a very successful run since the opening in May. Readers who have not yet visited this "Wembley of the North" should do so at the earliest opportunity, for chief among the many exhibits are those provided by the electrical industry.



This picture of Mr. W. Bannister, whose death is referred to on page 434, is reproduced from the framed portrait which was presented to him by the employees of the Chloride Electrical Storage Co., Ltd.



Sounding the "stand easy" in H.M.S. "Rodney." The vessel is fitted with special "public address" equipment involving 300 loud speakers, which provide communication with every deck and station. The bugler, here seen before one of the transmitters, is thus able to pass a command to all hands immediately he is instructed to do so.

A snapshot taken during the annual bowling match of the Electrical Contractors' Association of Scotland (East *v.* West), held on September 25th, on the bowling green attached to the Hall of the Royal Company of Archers, Edinburgh. Three rinks were played, and, as usual, the West were victorious, winning the match by two rinks to one. The visitors, after the match, were entertained to tea in the Archery Butts of the Royal Company by the Edinburgh members.

TRADE PUBLICATIONS.

SIGG, LTD., 469, Holloway Road, London, N.7, have published new literature regarding electric cooking utensils.

Publication No. 8 329 R. by DONOVAN AND CO., 47, Cornwall Street, Birmingham, concerns factory type isolating switches.

A catalogue of special productions has been published by BECK AND CO., LTD., 130, Great Suffolk Street, London, S.E.1.

The latest publication of BROOKHIRST SWITCHGEAR, LTD., Northgate Works, Chester, is a leaflet dealing with the automatic control of motors.

Two views of the "All-Electric Three" folder published by Radio Instruments, Ltd., showing the "plug" in and out of position.

The WESTMINSTER ELECTRIC SUPPLY CORPORATION, LTD., has published a new booklet relative to the hire of heating and cooking apparatus.

The WHITE-HALL BOILER BRIDGE CO., 35/36, St. Thomas Street, Lymington, Hants, has published a new leaflet dealing with smoke-consuming boiler bridges.

A special leaflet dealing with a new constant potential battery charging equipment has been published by NEWTONS OF TAUNTON, 6, Grape Street, Shaftesbury Avenue, London, W.C.2.

Catalogue Section No. 23, illustrating and describing metal-clad internal isolation switchgear (Whitehead system), has been published by SWITCHGEAR AND COWANS, LTD., Elsinore Road, Old Trafford, Manchester.

MAVOR AND COULSON, LTD., 47, Broad Street, Mile End, Glasgow, have published list No. 217/1 dealing with d.c. motor starters for industrial services, and list 218/1 describing similar starters but of the flameproof type.

An interesting publication by RADIO INSTRUMENTS, LTD., is a folder dealing with the "All Electric Screened Grid Transportable 3" receiver. This folder has on its first page an illustration of the set arranged with a silken cord attached to a "plug" for insertion in a "lamp socket" on the second page.

ILLUMINATION DESIGN COURSE.

A tentative programme for the twentieth Illumination Design Course, which commences on October 21st, has been prepared by the E.L.M.A. Lighting Service Bureau, and meetings at 15, Savoy Street, London, W.C.2, will be held as follows:

October 21st, 7 p.m. Registration and paper by Mr. L. E. Buckell, entitled "The Lamp of To-day." October 28th, 7.30 p.m. "Illumination Design," by Mr. F. March. November 4th, 7.30 p.m. "Selling Electric Light to the Shopkeeper," by Mr. T. Catten. November 11th, 7.30 p.m. "Electric Light in Industry," by Mr. S. Anderson. November 18th, 7.30 p.m. "Electrical Advertising," by Mr. H. Lingard. November 25th, 7.30 p.m. "Architectural Lighting," by Mr. R. W. Maitland. December 2nd, 7.30 p.m. "Miscellaneous Lighting Problems," by Mr. W. J. Jones.

ELECTRIC TRACTION.

Extensive Electrification Scheme in Bangkok and District.

ABOUT 93 miles of railway lines around Bangkok are to be electrified.

Doncaster T.C. has decided to scrap all but two of its tramway routes and to substitute trolley buses.

The change over from tramcars to railless trolley vehicles on the Allerton (Bradford) route will take place this month.

Edinburgh Transport Committee agreed last week to recommend the construction of a tramway 800 yards in length between the existing termini at Gorgie and Saughton Road.

Southend T.C. has applied to the Ministry of Transport for a loan of £2 160 for traction cables and section boxes on the extended trackless trolley route and for £540 for excess expenditure in connection with the extension.

The L.M. and S. Railway Co. is unable to adopt the suggestion of the Coventry Chamber of Commerce that the branch lines between Coventry and Leamington and between Coventry and Nuneaton should be converted to electric traction.

The annual report on Aberdeen Corporation's tramways and motor bus undertaking, which shows a net profit of £6 377 for the past year, states that orders have been placed for 12 of the latest type of tramcars, with transverse seats in the saloon and upholstered seats on the top deck.

Droylsden U.D.C. proposes to grant to Manchester Corporation a lease of a tramway extending from the boundary between Droylsden and Manchester to the boundary of the Droylsden and Audenshaw urban districts.

Glasgow Corporation recently approved a recommendation by the Parliamentary Bills Committee that, in connection with a proposal to require railways in the city to be electrified, it should be remitted to the Town Clerk to consult counsel and others on the matter, and that, in the meantime, the proposal be included in the next Provisional Order.

Brighton T.C. has decided that Volk's electric railway, which runs along the eastern beach, shall be retained. Notice had been given to Mr. Magnus Volk to determine his lease this month, but nearly 5 000 people signed a petition asking the corporation to revoke its decision. The railway is to continue for five years, subject to the station near the Palace pier being moved east of the proposed promenade extension.

A successful trial trip from Montreal to Toronto has been made on the Canadian National Railway by a new oil-electric locomotive. A Diesel engine on the locomotive drives d.c. generators, which operate motors geared on the axles. The H.P. developed is 2 660, and the continuous draw-bar pull is 40 000 lb. The engine is started by "motoring" the generators by means of accumulators. It is proposed to reduce the oil consumption by means of superchargers.

THE E.T.B.I. COMPETITION.

Solution to Cable Competition Organised in Connection with E.T.B.I. Funds.

WE give below the solution to the competition organised by the Electrical Trades' Benevolent Institution, and any competitor who has sent in a correct solution of all the names of the towns concerned should send in a claim to the office of the E.T.B.I., at 9, Southampton Street, London, W.C.1, on a postcard, setting out the solution sent in, together with the mileage of cable estimated to be required to join up these towns.

CLUES.	SOLUTIONS.
Godiva's Home	Coventry.
The Town of Fair Maids	Perth.
Robin Hood's City	Nottingham.
Bloater Town	Yarmouth.
Victory's End	Portsmouth.
Steel	Sheffield.
"Boaters"	Luton.
Bird and Water	Liverpool.
London's Shore	Brighton.
The Centre of the Cotton Trade	Manchester.
The Trouser University	Oxford.
Jan Ridd's County Town	Exeter.
Beau Brummel's Stage	Bath.
Butter Scotch	Doncaster.
"The 'Varsity as Rows"	Cambridge.
Opposite the King's Lost Jewels	King's Lynn.

Length of cable required, 1 496½ miles.

COMPANY NEWS.

Rise in Prices of Railway Stocks—Associated Fire Alarms Meeting—Philips' Glowlamp-works New Issue—Hurst, Nelson and Co.'s 20 per cent. Distribution—Reports and Dividend Announcements—New Companies.

THE firmest spot this week in the electrical share market is the railway section. Metropolitan and District ordinary stocks were bought, the quotation for the former rising 2½ points to 61, and the latter a point to 72½. Underground Electric Railways ordinary shares have moved up 6d. to 22s. 6d. British Electric Traction 6% preferred stock is 2 points higher at 124½. In the manufacturing section Insulateds and Callenders are each 1s. 3d. down. Crompton-Parkinson 2nd preference have changed hands at 18s. Marconi's International Marine have shed another half-crown.

PYE RADIO, LTD.—Transfer books will be closed from Oct. 24 to 31, inclusive.

STOTHERT AND PITT, LTD.—Div. of 10%, less tax (agst. 6% last year) is announced.

PENN-OHIO EDISON CO.—Div. on common stk. of 50 cents will be payable on Nov. 1.

AMERICAN COMMONWEALTH POWER CORPORATION.—Div. of $1 p. sh. on common stk. will be payable on Nov. 1.

ANCHOR CABLE CO., LTD.—Ord. sh. registers will be closed from Oct. 18 to 30, inclusive, for preparation of div. warrts.

NORTH METROPOLITAN ELECTRIC POWER SUPPLY CO.—Intm. div. of 4% on ord. shs. will be payable on Nov. 15.

VICTORIA FALLS AND TRANSVAAL POWER CO., LTD.—Net earngs. for qrtr. ended June 30, before providg. for taxatn., £302 255.

AMERICAN WIRELESS MERGER.—A $36 000 000 merger of the Kolster Radio Corporation and the Freedeiseman and Earl Companies was consummated on Oct. 2.

METROPOLITAN DISTRICT RAILWAY CO.—Int. for half-year endg. Oct. 31 on 4% prior lien deb. stk. will be payable on Nov. 1. Transfer books will be closed from Oct. 17 to 31, inclusive.

CITY AND SOUTH LONDON RAILWAY CO.—Int. for half-year ending Oct. 31 on 4% perpetual deb. stk. will be payable on Nov. 1. Transfer books will be closed from Oct. 17 to 31, inclusive.

CALLENDER'S CABLE AND CONSTRUCTION CO., LTD.—Intm. div. of 5%, less tax, on ord. shs. (same rate as last year) will be payable on Nov. 2. Ord. sh. registers will be closed from Oct. 19 to 31, inclusive.

CANADIAN HYDRO-ELECTRIC CORPORATION.—Energy produced in Aug., 1929, 163 779 000 kWh, increase 68% over Aug., 1928. From Jan. to Aug., 1929, inclusive, output was 1 304 137 000 kWh, increase 78%.

ASSOCIATED FIRE ALARMS, LTD.—Pft. for year ended June 30, 1929, was £5 441, agst. £7 004. Reserved for income tax, £1 018, agst. £1 058; to res., £1 000, agst. £2 000. Div. 8%, less tax (same as last year). Fwd. £1 694, agst. £1 932.

ORIENTAL TELEPHONE AND ELECTRIC CO., LTD.—Intm. divs. of 3½% on 7% cum. pref. shs. for current year, less tax, and 4% on ord. shs., tax free, are announced. Warrants will be posted on Oct. 31. Sh. transfer books are closed until Oct. 22, inclusive.

MEXICAN LIGHT AND POWER CO., LTD.—Divs. at rate of 7% p.a. for half-year endg. Oct. 31, 1929 ($3·50 p. $100 sh.) on 7% cum. pref. shs. and at rate of 4% p.a. for half-year endg. Oct. 31, 1929 (10 cents. per $5 sh.) on 4% cum. red. 2nd pref. shs. will be payable on Nov. 1.

HURST, NELSON AND CO., LTD.—Fin. div. of 10%, plus bonus of 2½%, less tax, on ord. shs. will be payable on Nov. 11, makg. 20% for year (same as last year). To res., £10 000; to depreciatn., £5 636; appropriation for 6% pref. div. due May 15, 1930, £4 800. Fwd. £10 917, agst. £9 629.

PHILIPS' GLOWLAMPWORKS, LTD.—The issue was announced last week of 1 367 000 ord. shs. at 250%, and 440 000 6% cum. pref. pft.-sharing shs. at 130%, with rights to shhldrs. in the proportn. of one new sh. for three old. The new cap. is needed for the company's extensn. Pfts. for the first nine months of the present year are stated to have been considerably higher than for the correspondg. period last year, and the management expects to be able to maintain the div. upon this increased cap., with full allowance for necessary writg-off.

SOCIETE INTERNATIONALE D'ENERGIE HYDRO-ELECTRIQUE (SIDRO).—It is announced that div. for year 1928-1929 will be paid on Nov. 4 at following rates against presentatn. of coupons No. 6: coupons from pref. shs. at frs. 47 (Belgas 9·40), coupons from ord. shs. at frs. 47 (Belgas 9·40), coupons from founders' shs. at frs. 171·83 (Belgas 34·366). In arriving at these amts. Belgian tax has been taken into consideratn. Amt. payable in Belgas will be converted into sterling at sight rate of exchange ruling on day of presentatn. Coupons may be presented at offices of Baring Bros. and Co., 8, Bishopsgate, E.C.2, and J. Henry Schroder and Co., 145, Leadenhall Street, E.C.3, London.

Digitized by Google

MONTREAL LIGHT, HEAT AND POWER CO.—Div. on common shs. of 60 cents p. sh. for qrtr. endg. Sept. 30 (same as last year) will be payable on Oct. 31.

AMERICAN AND FOREIGN POWER CO.—Div. of $1·75 on 2nd pfd. A stk. for the period from Oct. to Dec., 1928, in addition to regular qrtrly div. on $7 and $6 pfd. stks., is now payable.

NORTH AMERICAN CO.—Blce. sheet for year ended June 30, 1929, of North American Co. and its subsidiaries shows total assets have grown from $811 582 951 to $863 671 243. Res. fund stood on June 30 at $111 024 717, against $101 228 587 on June 30, 1928. Surplus, at $109 273 103, is made up of cap. surplus $24 645 241 and undivided pfts. $84 627 862. Correspondg. figures for previous year were: total surplus $90 970 465, comprising $25 668 032 cap., surplus and undivided pfts $65 302 432. Property and plant are valued at $745 164 651, agst. $698 486 364. Current assets $50 840 078, agst. $48 168 638, include $21 544 321 in cash, agst. $18 985 421. Funded debt for subsidiaries stands at $346 485 830, agst. $329 405 377, and current liabilities amt. to $11 627 546, agst. $19 818 411. It is stated that the North American Co. and its subsidiaries control the largest electric light and power system in America under single ownership. Under the terms of a recent offer made by this company with the object of raising $54 800 000 (£10 960 000) fresh cap. for further developmt., stkhldrs. will have right to subscribe until Nov. 15 to one sh. of common stk. at $100 p. sh. for each 10 common shs. now held. The new money raised by the stk. subscriptn. will be used in accordance with the company's policy of maintaing. its proportnate. int. in subsidiaries, especially in those which have recently expanded considerably. Extensive developmts. in the North American system are in progress in the Cleveland (Ohio) area, in California, and in the Osage River district, where a £6 000 000 hydro-electric project is now in process of executn.

POWER CORPORATION OF CANADA.—Operatg. revs. for year ended June 30, 1929, show increase of 130% over precedg. year at $1 947 590, compared with $849 871. Profits on sale of securities were $1 364 514, agst. $1 278 770, leaving gross earngs. $3 312 104. Deductg. exs. and taxes, net earngs. applicable to bond int. amt. to $2 846 418, agst. $1 802 557, and, after mtg. int. of $400 589 and divs. on both classes of pfd. totalling $680 000, residue applicable to common stk. was $1 765 829, equivalent to $4·46 p. sh. on 395 557 shs. outstandg. This compares with earngs. equivalent to $5·67 p. sh. on only 200 205 shs. outstandg. for precedg. year. Deduction of $394 843 for div. on common stk. and $550 000 for disct. on securities left pft. and loss surplus at $2 502 919, compared with $1 681 932. Changes in the blce. sheet reflect wide expansn. in operatns. of the company, total assets being over $18 000 000 higher at $46 963 045. Heavy increases are shown in investmts. in subsidiaries and other investmts., the former being up over $6 000 000 at $16 526 913 and the latter more than doubled at $29 504 222. The president states that it is the policy of the directors to pay cash divs. out of the rev. only, and any stk. divs. paid will be out of the pfts. realised from sale of investmts.

Company Meeting.

ASSOCIATED FIRE ALARMS, LTD.—Mr. Gordon H. Brown, presiding at the meeting on Tuesday, said a satisfactory feature of the accounts was that they were able again to recommend the payment of a dividend at the rate of 8%. In his address to the shareholders at last year's general meeting he foreshadowed the advisability of an early extension to their works at Walthamstow. That work had now been completed and the whole cost was charged in the accounts. The value of property in the United Kingdom protected by their alarms was over £100 000 000, and of this more than £50 000 000 represented property where they periodically examined and reported on their installations. In respect of the latter the result for the year to December, 1928, showed that the ratio of losses to premiums in respect of such property was under 1%. A more general use of automatic fire alarms would considerably reduce the heavy burden of the cost of fire losses, amounting to some £12 000 000 a year, which this country had to bear. The report and accounts were adopted.

Last Sunday night all the towns on the Leinster loop of the Shannon scheme were supplied, for the first time, with current generated in the power station at Ardnacrusha. This circuit has been fed from the Dublin electricity works as a temporary arrangement.

NEW COMPANIES.

NORWOOD RADIO, LTD.—Cap., £1 000. Manufacturers of and dealers in wireless and electrical apparatus and accessories, etc. Reg. Office: 28, Budge Row, London, E.C.4

KENNEDY AND KEMPE, LTD.—Cap., £2 500. Electrical and marine engineers, vehicle manufacturers and repairers, etc. Reg. Office: Harewood Forest, Longparish, Hants.

PHILIPS LAMPS (IRELAND), LTD.—Cap., £1 000. Electricians, manufacturers of, agents for and dealers in electric lamps, etc. A subscriber:—A. De Gong, 148, Kings Avenue, London, merchant.

ELECTRIC CENTRAL HEATING AND VENTILATING CO., LTD.—Cap., £20 000. Lighting, ventilating, heating, electrical and mechanical engineers, etc. Reg. Office: 157, West George Street, Glasgow.

HONEYCOMB BATTERIES, LTD.—Cap., £100. Electrical engineers, electricians, manufacturers of and dealers in electric cells, etc. A subscriber: R. H. Brown, 10, Coverdale Road, London, W.12, accumulator specialist.

JOSEPH PECK, LTD.—Cap., £25 000. To acquire business of dealer in electrical appliances and wireless apparatus, electricia n etc., carried on by J. A. E. Peck at Rotherham as "Joseph Peck." Reg. Office: College Square, Rotherham.

RADIO CLOCKS, LTD.—Cap., £100. To acquire and sell letters patent, brevets d'invention, licences and inventions, or any interest therein, to manufacture and deal in machinery, etc. Reg. Office: 53, Great Marlborough Street, London, W.1.

WEST LONDON ELECTRO-MEDICAL MANUFACTURING CO., LTD.—Cap., £100. To acquire patents or licences in connection with use of electro-medical or other electrical apparatus, etc. Solicitors: Linklaters and Paines, 2, Bond Court, Walbrook, London, E.C.4.

T. B. GERARD AND SONS, LTD.—Cap., £2 000. Electrical and mechanical engineers and contractrs, manufacturers of and dealers in electrical, magnetic, telegraphic, telephonic and other appliances and apparatus, etc. Reg. Office: 201, High Road, Chiswick, London, W.4.

AUTOMATIC LIGHT CONTROL, LTD.—Cap., £10 000. Electrical engineers and contractors, manufacturer and repairers of and dealers in machinery, electric, magnetic, galvanic and television apparatus, etc. Solicitors: R. A. Rotherham and Co., 38, Bailey Lane, Coventry.

GARDNER AND CO. (PORTSMOUTH), LTD.—Cap., £1 000. To acquire business of electrical engineer, etc., carried on by C. A. Gardner at Portsmouth, and to carry on same and business of manufacturers of and dealers in electric and other apparatus used in connection with wireless, etc. Reg. Office: Building Site, Hulbert Road, Bedhampton.

ARUN ELECTRICAL SUPPLIES, LTD.—Cap., £100. To acquire business of supplier, fitter and repairer of and dealer in electrical fittings, fixtures, apparatus, wires, lamps, shades, screens and other articles to be used as means of employing electrical power, carried on by W. L. Sibley as "Arun Electrical Supplies" at 15, Queen Street, Arundel. Reg. Office: 7, Hanover Square, London, W.1.

METAL AND CHEMICAL PRICES.

TUESDAY, October 8th.

	Price.	Inc.	Dec.
Copper—			
Best Selected .. .. .. per ton	£77 15 0	—	10s. 0d

Sulphur—Flowers, Ton £12 0 0 *Copper Sulphate*—Ton £25 to £25 10 0
„ Roll, „ £10 10 0 *Boric Acid* (Crystals) „ £30 0 0
Sulphuric Acid (Pyrites, 168°) Ton £6 15 0 *Sodium Chlorate*—Per lb. 2 1/2d.
Sodium Bichromate—Per lb. 3 1/2d.

Rubber—Para fine, 9 1/2d.; plantation, 1st latex, 9 1/2d.

∴ The metal prices are supplied by British Insulated Cables Ltd., and the rubber prices by W. T. Henley's Telegraph Works Co., Ltd.

THE LEAD MARKET.

Owing to lack of demand from consumers, the market last week was reported by James Forster and Co. to have sagged daily, and prices closed at the lowest. The American price is unchanged at 6·90 cents. Closing prices on October 4th were £23 5s. for October and November, £23 6s. 3d. for December, and £23 7s. 6d. for January, 3s. 9d. to 5s. per ton lower on the week.

COMMERCIAL INFORMATION.

County Court Judgments.

[NOTE.—*The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debt. They may be for actions. But the Registry makes no distinction. Judgments are not returned to the Registry if satisfied in the Court books within 21 days.*]

ABBA ELECTRICAL CO., LTD., Engine Street, Smethwick. £11 5s. 1d. August 19th.

APPLE, B., Mr., 87, Tottenham Court Road, W., wireless dealer. £10 3s. 6d. August 27th

BASSON ELECTRICAL CO., LTD., 32, Station Road, Swinton, wireless dealers. £36 8s. 11d. August 21st.

BATES, H. V., Mr., High Street, Linton, radio dealer. £20 18s. 5d. August 27th.

DAVIS CASH AND CO., LTD., 47, Mount Pleasant, E.C., electrical engineers. £17 15s. 2d. August 27th.

EAST SURREY WIRELESS CO., 20a, Station Road, Epsom, wireless engineers. £12 12s. 9d. July 31st.

GOLDMAN, H., Mr., 52D, High Street, Southend-on-Sea, electrical fittings manufacturer. £15 11s. 10d. August 6th.

HOLLINGS (C.) AND CO., 3, College Avenue, Staveley, wireless engineers. £105 17s. 9d. August 3rd.

LEYS, Sidney James, Mr., 144, East Esplanade, Southend-on-Sea, wireless dealer. £10 9s. 4d. August 31st.

MILLER, Harding, 168, Bedford Road, Rock Ferry, radio engineer. £11 2s. 10d. August 23rd.

NEW SIMPOLIA WIRELESS CO., 170 and 172, West Green Road, Tottenham, wireless dealers. £12 5s. 1d. August 15th.

RADIO BATTERY SERVICE CO., 194, Northfield Avenue, West Ealing, radio engineers. £20 14s. 8d. August 13th.

SENIOR'S WIRELESS AND ELECTRICAL STORES, 961, Abbeydale Road, Sheffield, wireless dealers. £15 14s. 2d. August 2nd.

SHIELDS AND GARE, 48, Queen's Road, Buckhurst Hill, electrician. £26 19s. August 28th.

SHORTHOUSE (F. A.) AND CO., 922, Stratford Road, Sparkhill, electrical engineers. £10 17s. 3d. August 20th.

WHOLESALE RADIO SUPPLIES, 126, High Road, Leyton, wireless dealers. £17 8s. 11d. July 31st.

WOODWARDS (CYCLE AND WIRELESS) STORES, High Street, Lyndhurst, electrical engineers. £22 15s. 7d. August 16th.

Bills of Sale.

KNIGHT, Otto Algernon, 4, The Common, Ealing, trading as KAY AND CO., 169, Railway Approach, Shepherd's Bush, wireless factor and general merchant. Dated September 26th, filed October 2nd. £80.

STERLING, James Daniel, 18, Carter Street, Sunderland, electrician. Dated September 28th, filed October 1st. £50.

Deed of Arrangement.

EDGINTON, Henry John Hewerton, and BROWNE, Ernest George, junr., trading at 34, Chapel Street, Sherwell, Plymouth, as WESTERN TRADING SYNDICATE, electricians. Dated September 27th, filed October 4th. Trustee, N. C. Eyre, 10, Princess Square, Plymouth, C.A. Liabilities unsecured, £493; assets, less secured claims, £108. Separate estate of H. J. H. Edginton. Liabilities unsecured £7, assets, nil. Separate estate of E. G. Browne, junr. Liabilities unsecured, £4; assets, nil.

Receiverships.

ANIMATED DISPLAYS, LTD. B. Biggs, of 202, Abbey House, Westminster, S.W.1, was appointed Receiver and Manager on September 27th, under powers contained in mortgage dated June 24th, 1929.

ROBINSON AND REX, LTD. A. W. Eccles, of 614, Garratt Lane, S.W.17, was appointed Receiver on September 27th, under powers contained in debenture dated May 25th, 1929.

THURSFIELD (C. J.) AND CO., LTD. W. F. Alldritt and C. E. Ward, of Sun Buildings, Bennett's Hill, Birmingham, were appointed Receivers and Managers, in substitution for the late W. E. Alldritt on September 13th, 1929, under powers contained in debentures dated January 8th, May 13th and October 10th, 1927.

TRE-COIL WORKS, LTD. J. E. Costello, C.A., of 90, Cannon Street, E.C., was appointed Receiver on October 2nd, under powers contained in debenture dated February 4th, 1929.

London Gazette, etc.

Company Winding-up Voluntarily.

STERLAND AND TATE, LTD. By resolution, September 17th, confirmed October 1st. F. Thompson, Junr., Chartered Accountant, 62, John Street, Sunderland, appointed as liquidator.

Bankruptcy Information.

DAFT, Hugh Edgar, Gloucester Place, Monument Street, Peterborough, electrical engineer. Receiving order, October 1st. Debtor's petition.

GRAHAM, Frederick Henry, 14, Hilltop Avenue, Harehills, Leeds, electrician. Receiving order, October 1st. Debtor's petition.

PHILLIS, William James, 87, Overton Road, Leicester, electrical engineer. Receiving order, October 2nd. Debtor's petition.

PAGE, Edgar George Matthews, 46, Bohemia Road, St. Leonards-on-Sea, dealer in wireless sets and accessories. First meeting, October 18th, 11.30 a.m., Official Receiver's Offices, 12A, Marlborough Place, Brighton. Public examination, November 11th, 2.15 p.m., Town Hall, Hastings.

Application for Discharge.

STRATHDEE, Andrew Knox Ewart, 923, Romford Road, Manor Park, trading as EMSCO RADIO, electrical engineer. Hearing, October 29th, 11 a.m., Bankruptcy Buildings, Carey Street, London, W.C.2.

Partnership Dissolved.

WOOD'S MAGNETO REPAIR DEPOT (Thomas William WOOD, Alick WEAVER, and George GUY), automobile electrical specialists, 8, Rotten Row, Christchurch, Hants, by mutual consent as from July 1st, 1929. Debts received or paid by A. Weaver and G. Guy, who continue the business.

Bankruptcy Proceedings.

DEEBLE, Samuel John, senior, electro therapeutist, and DEEBLE, Samuel John, junior, engineer, trading as the ELDON SUN RAY CENTRE, 18, Eldon Square, Newcastle-upon-Tyne. The statement of affairs shows gross liabilities amounting to £388, of which £298 is expected to rank, and no assets. Debtors attribute their failure to opposition by the medical profession. At their public examination at Newcastle, the Official Receiver suggested to the debtors that there was no opening for their business in Newcastle. The senior debtor replied that there was a big opening for the business, but people in Newcastle did not realise the value of sun ray treatment. Debtor was questioned regarding his financial affairs, and admitted that he twice previously made deeds of arrangement. The examination was adjourned.

STONE, George Frederick Amos, trading as the STONE MANUFACTURING CO., electrical accessories manufacturer, 108, Great Saffron Hill, London, E.C. At the first meeting of creditors, a statement of affairs was submitted which showed ranking liabilities £1,889, and net assets £177, after deduction of £68 in respect of preferential claims.

It appeared from statements made by the debtor in preliminary examination that prior to the war he was an established civil servant in the engineering department of the Post Office. He joined the Army in 1916, received his discharge in 1919, and returned to his employment in the Post Office. Service with the Army, however, having unsettled him, he resigned his position in May or June, 1920, and commenced business on his own account in the style of the General Maintenance Electricity Co., at 14, High Street, Pinner. His capital was £150 or £200. After trading for 12 months his business was taken over by a company. As consideration he received 300 fully paid £1 shares in the company and he became sales manager at the head offices of the company, Whitecross Place, E.C., at a salary of £6 p.w. Within 18 months the company went into liquidation, and he lost his position and received nothing in respect of his shareholding. A month later he made a fresh start with a capital of £200 at Finsbury Place, where he traded as the Lighting Supply Company. He did an improving business, and extended his premises by taking two further shops, Nos. 4 and 5, Finsbury Place, and within two years was making a net profit of £1,000 p.a. He then took in a partner, who introduced £2,500 into the business. A company was immediately formed with a capital of £7,500, and offices at 45, Horseferry Road, S.W., which took over the business and transferred the connection to the new address. As vendor, he was to receive £1,000 in cash and 4,000 fully paid £1 shares in the company. He was allotted the shares, but received only £400 in cash. He became joint managing director at a remuneration of £400 p.a. and travelling expenses, and held that position until July, 1927, when a receiver was appointed by a debenture holder, and the company was wound up. In the same month, July, 1927, with £90 raised from his bankers on security, he recommenced business on his own account at 108 and 109, Gt. Saffron Hill, as the Stone Manufacturing Co., and he continued to trade there down to July last. The business consisted of articles manufactured under his own patents, for which he had obtained provisional protection (since expired), and he was handicapped by lack of capital. In June last he had a nervous breakdown, and was away from his business for a month. During his absence his affairs were investigated by his two brothers, who consulted an accountant, who advised that a meeting of the creditors should be called. The meeting was subsequently held, and an offer was made by which the creditors were to accept 5s. in the £ by instalments extending over 12 months, and that he should continue the business, working under a committee appointed by the creditors reporting to the trustee every three weeks with a view of paying 20s. in the £1. The accountant was appointed trustee under that proposal and went into possession of his business and there the matter remained until the petition was filed against him. He attributed his failure to the delay in the delivery of raw materials and to insufficient capital.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

292 499 A.C. Spark Plug Co. Thermostatic control for magnetic measuring instruments. (20/6/27.)
316 360 W. R. Hume. Electric welding-machines. (7/5/28.)
316 366 M. Rehse. Submersible alternating-current motor-driven pumping-apparatus. (17/5/28.)
291 115 Associated Telephone and Telegraph Co. Train-control systems. (27/5/27.)
292 465 Forges et Ateliers de Constructions Electriques de Jeumont. Asynchronous electric cascade generator. (18/6/27.)
316 378 W. P. Digby and R. B. Fairthorne. Cooling of electrical transformers. (8/6/28.)
296 019 C. Epner. Production of electric discharges at elevated temperatures. (23/8/27.)
312 140 Langendorf Watch Co. Manufacture of electric contact pins or plugs. (21/5/28.)
316 384 General Electric Co., Ltd., and W. Wilson. Electric time switches. (15/6/28.)
293 300 Patent-Treuhand-Ges. Fur Elektrische Gluhlampen. Alternating-current rectifying devices. (2/7/27.)
302 219 Energos Ges. Electrically-operated brushes for treatment of the skin. (12/12/27.)
316 392 T. E. Ward. Totalisators. (25/6/28.)
316 405 Igranic Electric Co., Ltd., and A. H. Curtis. Electric variable-resistance devices. (3/7/28.)
293 425 Fabrik Elektr. Apparate F. Sauter Akt.-Ges. Time-switch mechanism. (6/7/27.)
316 416 Electrical Improvements, Ltd., L. C. Grant and G. R. Wilson. Electric heating boilers, steam generators, and the like. (12/7/28.)
316 421 J. Fiddes. Recording means for electromotors. (13/7/28.)
316 433 O. Y. Imray (I.G. Farbenindustrie Akt.-Ges.). Manufacture of accumulator plates. (24/7/28.)
295 650 Akt.-Ges. Brown, Boveri, Et Cie. Means for controlling electrically driven transporting machines, such as winding-engines and hoists (16/8/27.)
316 436 Electrical Improvements, Ltd., and L. C. Grant. Protection of alternating-current dynamo-electric machines and systems. (25/7/28.)
316 439 Aronwerke Elektrizitats Ges. and W. Stern. Electrical distant-indicating plant and a method of adjustment thereof. (30/7/28.)
295 329 Associated Electrical Industries, Ltd. Electrical circuit-interrupting devices. (9/8/27.)
295 286 International General Electric Co., Inc. Electric plug-and-socket connections. (8/8/27.)
316 446 G. Monaghan. Anodes for electrolytic baths. (9/8/28.)
316 449 W. L. Shaw, J. Joseph and Radio Instruments, Ltd. Electrical transformers. (22/8/28.)
316 455 M. B. Wild and Co., Ltd., and E. Small. Electric cable winches. (25/8/28.)
296 415 S. Loewe and E. Roemhild. Electron valve with indirectly-heated cathode. (31/8/27.)
297 059 R. Bosch Akt.-Ges. Switch-boxes for the starter and battery ignition in internal combustion engines. (13/9/27.)
299 304 General Railway Signal Co. Railway-control systems. (22/10/27.)
299 700 Siemens-Schuckertwerke Akt.-Ges. Electric switch-gear with air blast. (29/10/27.)
301 018 Maschinenfabrik Oerlikon. High-speed direct-current circuit-breaker. (23/11/27.)
301 823 Akt.-Ges. Der Maschinenfabriken Escher, Wyss, et Cie. Mercury switches. (6/12/27.)
316 484 Cine-Sound, Ltd. (E. Marcus). Apparatus for the synchronous production or reproduction of pictures and accompanying sound. (31/10/28.)
302 650 Naamlooze Vennootschap Philips' Gloeilampenfabrieken. Electric voltage indicators. (19/12/27.)
300 244 Associated Telephone and Telegraph Co. Train-control systems. (27/5/27.)
302 228 Telefunken Ges. Fur Drahtlose Telegraphie. Analysing or synthesising apparatus for television. (12/12/27.)
301 841 British Thomson-Houston Co., Ltd. Apparatus for colouring glass. (6/12/27.)
316 352 Y. Mercier. Apparatus for treatment of liquid hydrocarbons by the electric arc. (20/4/28.)
305 166 Soc. Technique D'Etudes et D'Enterprises Pour L'Industrie and A. Huguenin. Electric signalling systems. (1/2/28.)
285 077 D. P. A. A. Kayser. Lighting of luminous electric discharge tubes. (11/2/27.)
316 632 W. Phillips and Elliott Bros. (London), Ltd. Electrical measuring instruments and circuit arrangements for use therewith. (29/3/28.)
291 785 Siemens and Halske Akt.-Ges. Thermionic cathodes of high emissivity. (10/6/27.)
290 278 Siemens-Schuckertwerke Akt.-Ges. Arrangement for introducing voltages into alternating current circuits. (12/5/27.)
316 566 V. Hope. Electric fuse boards or boxes. (27/4/28.)
316 598 H. Waterhouse. Street traffic controlling or signalling devices. (28/4/28.)
316 529 A. Reyrolle and Co., Ltd., and N. Cooke. Electric protective relay arrangements. (30/4/28.)
300 622 K. Von Dreger and A. F. Horn. Electrically driven talking machines, gramophones, or the like. (18/11/27.)
289 884 E. Wehren. Telephone systems. (5/5/27.)

Applications for Patents.

July 11th.

21 340 Associated Electrical Industries, Ltd. Control systems for elevators, etc. (11/7/28, U.S.).
21 332 J. L. Baird and Television, Ltd. Television apparatus, etc.
21 373 British Thomson-Houston Co., Ltd. Transformers. (11/7/28, U.S.)
21 374 British Thomson-Houston Co., Ltd., and W. B. Green. Motor control systems.
21 375 British Thomson-Houston Co., Ltd., and G. S. C. Lucas. Photo-electric cells.
21 367 Callender's Cable and Construction Co., Ltd., and F. S. Smith. Producing high voltages.
21 338 H. L. Duncan. Commutators, etc.
21 349 Graham-Amplion, Ltd., and G. Holdway. Electric switches.
21 350 G. Holdway. Electric supports, etc.
21 363 Lodge-Cottrell, Ltd. (H. V. Welch). Electrical precipitation plants.
21 364 Metallges Akt. Ges. Electric conductors. (15/10/28, Germany.)
21 388 Pioneer Instrument Co., Inc. Illuminating dials of instruments. (26/3/29, U.S.)
21 382 E. A. Rosengrens Kassaskapsfabriks Aktiebolaget. Welding with rolling electrodes. (12/3/29, Sweden.)
21 360 Siemens-Reiniger-Veifa Ges. fur Medizinische Technik. X-ray apparatus. (21/7/28, Germany.)
21 294 H. W. Stapleton. Electric time switches.
21 289 R. N. Wellington. Electrical switching device for electrical reproducing gramophones, etc.
21 341 Westinghouse Lamp Co. Electron emission materials. (11/7/28, U.S.)

July 12th.

21 556 Automatic Telephone Manufacturing Co., Ltd., S. G. Eddowes, and T. C. Jordan. Switches for telephone systems.
21 557 Automatic Telephone Manufacturing Co., Ltd., and G. A. Burns. Electric signalling systems.
21 421 G. G. Blake. Regulating electric currents.
21 496 British Thomson-Houston Co., Ltd. Amplifier circuits.
21 497 British Thomson-Houston Co., Ltd., and W. J. Pool. Electric motor control.
21 498 British Thomson-Houston Co., Ltd. Gaseous conduction lamps. (12/7/28, U.S.)
21 501 British Thomson-Houston Co., Ltd. Transformers. (12/7/28, France.)
21 532 P. Dunsheath. High-voltage cables.
21 553 Electrical Research Products, Inc. Telegraph repeating devices. (18/7/28, U.S.)
21 567 G. B. Ellis (Soc. des Usines Chimiques Rhone-Poulenc). Photo-electric cells.
21 568 G. B. Ellis (Soc. des Usines Chimiques Rhone-Poulenc). Generation of photo-electric currents.
21 506 G. E. T. Eyston. Control of superchargers.
41 439 C. W. Hynd. Coin-freed dynamos, etc.
21 566 E. V. Kayley. Thermionic valves.
21 410 F. A. Lindemann. Photo-electric cells.
21 456 W. Ludke. Production of electric rotating fields. (12/7/28, Germany.)
21 534 Perryman Electric Co., Inc. Navigational direction finders. (5/12/28, U.S.)
21 573 Pioneer Instrument Co., Inc. Mariners' compasses. (11/5/29, U.S.)
21 468 L. Poulsen and Co. Shadeholder for electric lamps. (21/7/28, Denmark.)
21 509 Siemens-Schuckertwerke A.G. Electric interrupter apparatus. (13/7/28, Germany.)
21 510 Siemens-Schuckertwerke A.G. Sleeves for lead cables. (14/7/28, Germany.)
21 526 Westinghouse Lamp Co. Electron discharge devices. (12/7/28, U.S.)
21 412 T. E. Williams. Wireless receiving sets.
21 455 C. S. Afia. Electric lamps.

July 13th.

21 649 Associated Electrical Industries, Ltd. Arc extinguishing devices. (14/7/28, U.S.)
21 621 Automatic Telephone Manufacturing Co., Ltd., and P. N. Rosbby. Magnet cores for loading coils, etc.
21 647 C. E. G. Bailey and Gramophone Co., Ltd. Wireless tuning systems.
21 616 British Thomson-Houston Co., Ltd. Altitude indicating systems for aircraft.
21 617 British Thomson-Houston Co., Ltd., C. G. Mayo and J. G. Wellings. Electric measuring apparatus.
21 618 British Thomson-Houston Co., Ltd., and H. Trencham. Electrical contacts.
21 592 J. S. Burns. Electric switches.
21 609 R. H. Camp, A. J. Hughes, H. Hughes and Sons, Ltd., and D. H. Perkins. Magnetic compasses.
21 632 E. N. Elford, Graham-Amplion, Ltd., and D. Sinclair. Indicator scales for wireless apparatus.
21 634 E. N. Elford and Graham-Amplion, Ltd. Indicator scales for wireless apparatus.
21 631 Felten und Guilleaume Carlswerk A.G. Aerial cables. (26/9/28, Germany.)
21 654 Ferranti, Ltd., and W. Holmes. Voltage testing devices.
21 633 Graham-Amplion, Ltd., A. D'A. Hodgson and G. Holdway. Switchgear
21 619 International General Electric Co., Inc. X-ray tubes. (14/7/28. Germany.)
21 580 J. Neale. Thermo-electric couples, etc.
21 603 J. Whiting. Electric trailing cables.

COMING EVENTS.

Saturday, October 12th.

Association of Mining Electrical Engineers (Western Sub-Branch).—Chairman's address.
27th A.A. Battalion R.E. (T.A.).—Battalion Dance. Headquarters, Rochester Row, London, S.W.1. 7.30 *p.m.*
Association of Mining Electrical Engineers (South Wales Branch).—South Wales and Monmouthshire School of Mines, Treforest. Paper by Mr. J. B. J. Higham on "Cotton in Engineering." 6 *p.m.*

Monday, October 14th.

Electrical Contractors' Association (Liverpool Branch).—Ordinary meeting.
Electrical Contractors' Association (Hastings Branch).—Lewcock's Restaurant. Ordinary meeting.
Institute of Transport.—Institution of Electrical Engineers, Victoria Embankment, London. Inaugural address by the President. 5.30 *p.m.*
Institution of Electrical Engineers (Western Centre).—South Wales Institute of Engineers, Cardiff. Chairman's (Capt. S. B. Haslam) inaugural address. 6 *p.m.*
Institution of Heating and Ventilating Engineers (Associate Members and Graduates' Section).—Borough Polytechnic, Borough Road, Southwark, London, S.E. Paper by Mr. F. F. Powell on "Vacuum Cleaning." 7 *p.m.*
Sheffield Illumination Society.—Lecture Hall, Y.M.C.A., Fargate. Paper by Mr. F. L. Nichols on "Lamps, Ancient and Modern." 7.30 *p.m.*

Tuesday, October 15th.

Electrical Association for Women (Bristol and District Branch).—Electricity Offices, Colston Avenue. Lecture on "How a House is Wired," by Mr. H. R. Beasant. 3 *p.m.*
Association of Supervising Electrical Engineers.—Junior Institution of Engineers, 39, Victoria Street, London. Presidential address by Mr. S. B. Donkin. 7.15 *p.m.*

Wednesday, October 16th.

Electrical Contractors' Association (Sussex Branch).—Midland Bank Chambers, Brighton. Ordinary meeting.
Overhead Lines Association.—Institution of Electrical Engineers, Savoy Place, Victoria Embankment, London. Annual general meeting. 5.30 *p.m.*
Institution of Electrical Engineers (North Midland Centre, Sheffield Sub-Centre).—Royal Victoria Hotel. Address by the chairman, Mr. H. W. Walker 7.30 p.m.

Friday, October 18th.

North-East Coast Institution of Engineers and Shipbuilders.—Bolbec Hall, Newcastle-upon-Tyne. Presidential address by Mr. L. E. Smith.
Institution of Mechanical Engineers.—Storey's Gate, St. James's Park, London. General meeting. Presidential address by Mr. D. Adamson. 6 *p.m.*
Electrical Development Association.—Royal Society of Arts, John Street, Adelphi, London. Conference on "Personal Salesmanship in the Electrical Industry." Speaker, Miss G. Burlton. 7.30 *p.m.*

Saturday, October 19th.

Electrical Power Engineers' Association (Southern Division).—Hotel Cecil, Strand, London. Eleventh annual dinner. 5.30 for 6 *p.m.*

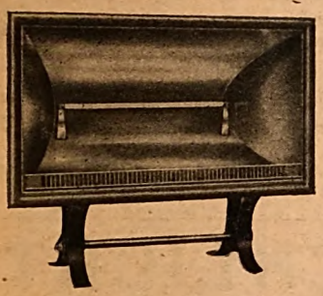
THE ELECTRICIAN

Vol. CIII.—No. 2681. Friday, October 18, 1929. [Registered at the General Post Office.] Sixpence

THE FERRANTI FIRE

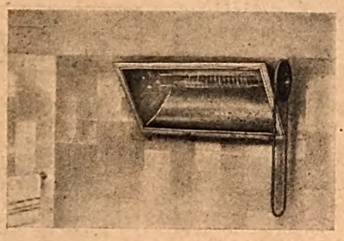
Universally acclaimed the perfect electric fire. It yields true radiant heat and makes electricity economically preferable to other means of domestic heating.



Model I.

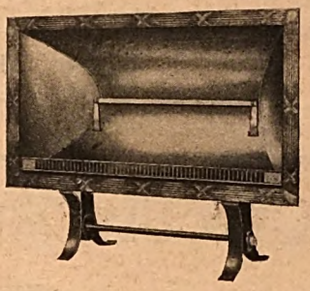
Single Bar - £4 0 0
Two Bar - £6 10 0

Single Bar Size 1¼ Kw
Two Bar Size - 2½ Kw
(with 2-heat switch).



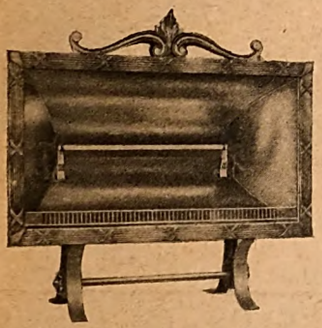
Wall Type for Bathrooms, etc.

Single Bar - - £5 10 0
Two Bar - - £8 0 0



Model II.

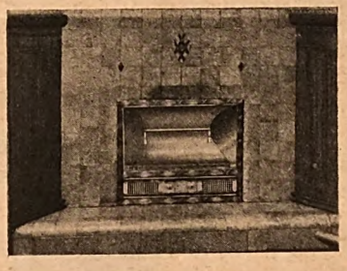
	Oxy. Copper	Oxy. Silver
Single Bar	£5 5 0	£5 15 0
Two Bar -	£7 15 0	£8 8 0



Model III.

	Oxy. Copper	Oxy. Silver
Single Bar	£7 15 0	£8 5 0
Two Bar -	£10 5 0	£10 15 0

All Reflectors Chromium Plated.



Flush Type.

	Oxy. Copper	Oxy. Silver
Single Bar	£8 15 0	£9 10 0
Two Bar -	£11 5 0	£12 0 0

Ferranti Ltd. • Hollinwood • Lancs.

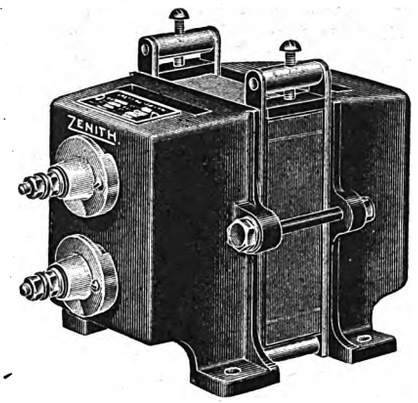
ZENITH

(REGISTERED TRADE MARK)

INDUCTANCES and CHOKE COILS for FILTER CIRCUITS



Quotations on receipt of detailed inquiry.

THE ZENITH ELECTRIC CO., LTD.

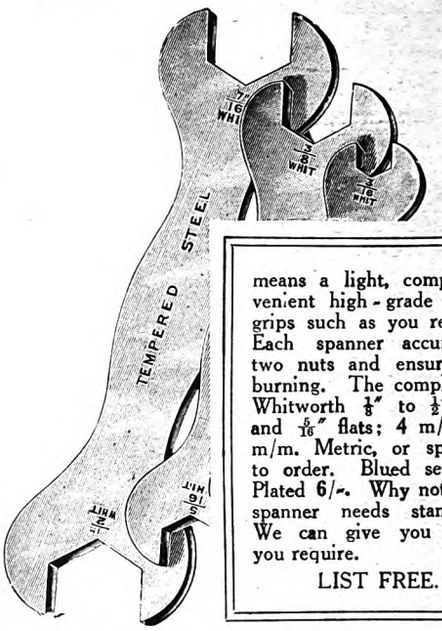
Sole Makers of the well-known "Zenith" Electrical Products

Contractors to the Admiralty, War Office, Air Ministry, Post Office, L.C.C., &c.

Zenith Works, Villiers Road, Willesden Green, London, N.W.2

Phone: Willesden 4087-8. Telegrams: Voltaohm, Willroad, London

"TERRY" Spannerage



means a light, compact, convenient high-grade range of grips such as you really need. Each spanner accurately fits two nuts and ensures against burning. The complete set is Whitworth $\frac{1}{8}$" to $\frac{1}{2}$", and $\frac{1}{4}$" and $\frac{5}{16}$" flats; 4 m/m. to 14 m/m. Metric, or special sizes to order. Blued set 5, 3/6; Plated 6/-. Why not get your spanner needs standardised? We can give you what you require.

LIST FREE.

Make your own tool racks—

Terry's "AVECTA" tool clips 3/- doz. with screws.

In case of difficulty please write us.

Herbert Terry & Sons, Ltd., Manufacturers, Redditch, Eng. Est. 1855.

Problems for Contractors.

IN an intensely provocative article on another page of this issue, Mr. T. C. GILBERT, who claims to be one of the Bolshevists of the electrical installation trade, outlines some of the outstanding problems which confront electrical installation engineers to-day, examines proposals for setting the contracting house in order, and attempts to reconcile the many conflicting opinions which are held regarding these matters. Mr. GILBERT, like most of the people whose views he quotes on one side or the other, has devoted considerable thought to the problems with which the contracting trade is beset, and though some of his arguments may not meet with universal approval, we do think that his summing-up of the present position is worthy of careful consideration as a basis for the formulation of a clear-cut policy which will in turn permit active steps to be taken to remedy some of the troubles from which the good-class contractors are now suffering. The two outstanding matters round which argument centres are compulsory registration and compulsory wiring rules. Both of these important measures are generally considered to be fairly satisfactory in principle, but when detailed examination of the proposals begins, remarkable divisions of opinion immediately appear. As the contractors themselves seem unable to dispose of the difficulties, we are glad to see one of their number appealing for advice and suggestions from other sections of the industry, and we hope that some useful hints will be offered as the result of this appeal. In consideration of the big problems connected with the large-scale generation and distribution of electricity, many of us are apt to overlook the undoubted importance of the installation which permits the consumer to use the resources which the industry as a whole has provided for him. The installation side has improved tremendously in the past few years, but it would be futile to suggest that it is not still severely handicapped by the "kerbstoner." The cry for betterment in the installation trade, as Mr. GILBERT points out, comes to-day from within and not from without, and we hope that realisation of the truth of the saying that a chain is as strong as its weakest link will stimulate constructive thinkers in other branches of the industry to formulate practical suggestions for consideration by the contractors.

"Regional" Broadcasting and the Contractor.

THE official working of the first of the regional broadcasting stations in this country will commence on Monday, when the Brookman's Park station takes over the responsibilities of the present 2LO at Oxford Street. Since, for the time being, the new station will radiate only one programme, there is likely to be little inconvenience to the general public, apart from the fact that there may be some difference in the volume distributed in certain areas. Such difference in signal strength, if any, will have already been detected during the test transmissions of the last month. So far, so good, but a somewhat different problem is likely to arise when Brookman's Park starts radiating the second programme on the wavelength of 261 metres. The problem will be common to all regional transmitters when they are "put on the air," and it behoves the electrical contractor to gain first-hand experience from the fare offered by Brookman's Park, in order that he may be able to meet later contingencies. Once the two transmitters come into operation many of the older receivers now in use will be incapable of separating the programmes. We say "receivers now in use" somewhat guardedly, for any of the modern equipment, or any of the recently published receiving circuits should, without reservation, prove equal to an even greater demand upon their selective abilities. On the other hand, many licence holders are still using the sets they bought three, four and five years ago, when conditions called for no great degree of selectivity.

Digitized by Google

Under the regional scheme these early sets may not be equal to the task of separation, even though the wavelength difference be over 100 metres. Indeed, some of these same receivers even now receive 5GB with a background of 2LO, thus making the regional problem from a receiving point of view all the more acute.

Solving the Difficulty.

THE far-seeing electrical contractor will have already realised that regional broadcasting will have a very considerable effect upon his radio business, bringing him into contact with many of the listening public who, through inability to obtain satisfactory results, will seek his aid. Obviously, the first recommendation to make in such cases will be the installation of a good modern receiver of the multi-valve type, but where financial inability to purchase is a deciding factor the recommendations should take the form of suggestions whereby existing apparatus may be altered to cope with the new conditions. In order to assist the electrical contractor in this direction, we publish elsewhere in this issue details of a number of methods whereby the selectivity of old receivers may be improved, and though, for reasons of space, these do not cover the whole of the field, they nevertheless serve to show how to improve most of the circuits with which contractors are likely to be concerned. It will be appreciated that the details given are concerned solely with programme separation and not in increasing signal strength. Should "regional" distribution prove to originate queries bearing on increasing the range of old equipment, then the subject will be dealt with in article form at a later date. Meanwhile, considerable business may be done in components, such as coils, formers, condensers, etc., in readiness for the somewhat more exacting conditions which will come about in the very near future.

October 21st.

THOSE of our readers who have followed the controversy regarding the American plans for a world-wide celebration of "Light's Golden Jubilee," honouring Mr. EDISON (instead of the late Sir JOSEPH SWAN) as the inventor of the incandescent electric lamp, will remember that this misplaced tribute culminates on October 21st with an attempt to broadcast throughout the world a special tribute to EDISON. Various foreign countries have been asked to undertake the organisation of broadcasting and public lighting displays on this occasion, and those which are not aware of SWAN'S undoubted priority seem to be interesting themselves in the proposals. In this country—much as we admire EDISON'S many valuable inventions in other fields—we are naturally unable to support the American claim. On the contrary, suitable steps are being taken to draw public attention to SWAN'S achievement. Sir OLIVER LODGE will give a broadcast talk from 2LO this (Friday) evening on "The Beginnings of Electric Lighting," and his remarks should prove a useful corrective to the mistaken notions in regard to this matter which are so persistently held by our friends in the United States.

The Sussex Downs Scheme.

IN sanctioning the erection of overhead transmission lines on the Sussex Downs in the face of formidable opposition, Mr. MORRISON, the Minister of Transport, has shown peculiar strength and foresight, and his recent public statement on the matter may be taken as an indication that while he is determined that material need shall not ride rough-shod over "England's green and pleasant land," he is fully alive to the industrial and domestic importance of the construction of the "grid" scheme in its entirety. He has shown that he will not be intimidated by the reactionaries whose sole mission in life seems to be to preserve everything, including, presumably, the shacks and unsightly buildings with which the Sussex Downs are already afflicted. The opposition relating to this question is not dead yet, but the decision of the Minister of Transport permits us to regard it as at least bereft of its sting.

Our Overseas Trade.

BRITISH export trade during the nine months of this year showed an increase of £8 457 118, when compared with the same period last year, and an increase of £24 916 393 by comparison with the same months of 1927. Exports for September, 1929, however, do not convey the same good impression for, by comparison with August last, trade declined by nearly £8 000 000, though only £1 575 715 when compared with September, 1928. Imports during September last also increased by some £11 000 000 when compared with the total for September, 1928, the increase being due to larger purchases of foreign manufactured goods in the way of non-ferrous metals, electrical goods and machinery, and to bigger importations of raw materials. With respect to the increase of £8 457 000 in export values for the nine months, three-fourths of this amount was accounted for by increased coal exports, manufactured goods actually showing a decline of £878 000, due in a large measure to the falling off of textile trade. The returns to date show an adverse trade balance, that is imports in excess of exports, of £269 000 000, as against £259 000 000 last year and £290 000 000 in 1927. The rise in imports and the fall in exports were largely due to trade in cereals in the case of imports and the falling off of the trade in textiles, wool, etc., which has taken place in the case of exports.

The Electrical Position.

TRADE conditions appertaining to the electrical industry were also partly responsible for the lower export figures for the month, for, according to the Board of Trade returns, of which details are given on another page, the total exports for the month under review were £148 038 less than for the corresponding month last year. On the other hand, the details show a considerable increase during the month of export trade in machinery other than railway and tramway motors, and rubber insulated cables and wires other than submarine, which between them show an improvement of no less than £97 413 when compared with September, 1928. These improvements are not by any means isolated, for electrical measuring instruments, batteries and accumulators, switchboards other than telegraph, all show substantial increases, together with other items. Submarine cables, however, show a bad return, with a total for the month of £45 612, or £327 446 less than for the same month last year. Imports during the month under review were, with the exception of three items, all heavier than during the same month of 1928. Notwithstanding this fact, the value of the exports for the month was £547 609 in excess of that of the imports, while we still maintain a favourable electrical trade balance for the nine months of £8 486 907.

OUR HOUSE IN ORDER.

Urgent Problems for Electrical Installation Contractors—How to Improve the Standard of Work—Registration or Regulations ?—The Inspection Bogey— The Need for a Clear-cut Policy.

By T. C. GILBERT.

EVERY week in our technical papers we read interesting details of super-station equipment, of larger and better generators and transformers; every day we read in our newspapers of big contracts awarded to this or that manufacturer, for overhead equipment to bring us the output of these super-stations. All these things, we are told, are done for one purpose only, and that is to bring electricity into most, if not all, of the houses in the country.

But one important point in this chain from station to house we neglect. We study the wind stresses on the overhead line carrying the supply to the farmhouse down to the fifth decimal place, but we do not worry as to what sort of installation the farmer has inside his house; the details of an installation where some of these enormous supplies are applied to public use are beneath our dignity.

Surely the point of contact (figuratively speaking of course) with the public should be a question of at least as much importance as, say, the disposal of ashes in a super-station, or the rival merits of concrete, steel, or wood poles? But do we find equal consideration given in our technical papers? I venture to state that the space allotted to installation practice per annum is probably equal to that given to businesses for sale.

Installation Problems.

This cannot be because the installation side has no problems or does not cry out for notice, as it is to-day shot through with inefficiency and incompetence, and its name stinks unto high Heaven. Nowhere is this better realised than within the installation trade itself, and it is at least a sign of grace that the cry for betterment comes from within and not from without. At the same time our critics are by no means silent, and it is becoming increasingly realised that better standards of work will have to be set up in view of the prospect of universal a.c. supplies for domestic use. These supplies at lethal pressure will be directly handled by the public, and the installation engineer is very worried as to how these improved conditions are to be brought about and maintained.

Public utterance of the electrical contractors' plea for a better standard of work was made by the President of the E.C.A. on the occasion of the annual dinner of the E.C.A. and Allied Associations, held at the Savoy Hotel, on January 23rd of this year. This plea was warmly upheld by the then Minister of Transport, Col. Ashley, at the same function, when he roundly condemned shoddy work. Speeches and writings of presidents and others who speak with authority for the E.C.A., have been burdened with this plea for many years.

The incompetent and half-trained contractor will, of course, always carry on his nefarious trade until he is forcibly prevented from doing so, but the greatest tragedy of all is the spectacle of the skilled and the expert being forced to carry out mediocre work because of price conditions.

The legitimate contractor has to-day to compete with the ex-blacksmith and the plumber, or worse still, with the mechanic from the neighbouring factory or dockyard, who works in his spare time.

All will agree that here is a state of affairs calling for instant remedy if public confidence in electrical service is to be maintained, and the greatest possible use made of our abundant electrical supplies. The problem is, of course, how to bring about the greatly desired improvement, and it is here, possibly, that persons outside the installation side of the business may help with their advice and suggestions, seeing that our own leaders' views are so sadly divided.

As a humble member of the rank and file my weak voice has been raised in other quarters as to how we should work to improve the general standard of safety in electrical installations in this country, and I have been told so many ways that I can only hope that they will not all be tried at once. Two main answers—Registration and Regulations—stand out from amongst the welter, but no two opinions on either seem to be alike, and in some cases are diametrically opposed; my own conclusions appear to meet with nobody's approval, so where are we? Cannot our big brothers of the super-stations and the grids spare us a few moments from their own problems and help us with their suggestions as to the solution of ours?

For their information, let me marshal the varied opinions of our own leaders as I understand them to-day. It is now generally accepted amongst them that only three main ways exist for the improvement of the standard of electrical installation work, these being either Compulsory Registration, Compulsory Regulations, or (most votes of all) a combination of both. So far, opinions are not seriously divided, the general body of contractors agreeing that to work along some, or all, of these lines may bring about the desired end. When, however, we come to examine these proposals in detail, opinions differ at almost every point, and these differences I propose to boil down as far as possible, and set out as clearly as I can.

To take the first remedy, compulsory registration. Several E.C.A. members, notably Mr. E. R. Morris, have had the temerity to suggest that compulsory registration, without any appendages such as compulsory wiring rules, will fill the bill. In an article in the February "Electrical Contractor," after condemning compulsory regulations on various grounds, Mr. Morris says, "The compulsory registration of contractors and the licensing of wiremen is a much more simple and effective measure and cuts right to the heart of the trouble in one thrust." The present writer supported this view in a subsequent article in the same paper, but a load of trouble has now descended upon our heads, for our proposals are stated to be illogical, seeing that before we can have compulsory registration we *must* have a compulsory wiring code. In a communicated article in the "Electrical Contractor" (September, 1929) we find the following:—

> "In any case, no system of compulsory registration can possibly be brought into effect prior to the setting up of a compulsory code of wiring rules. To suggest that compulsory registration can precede compulsory rules is to put the cart before the horse and fly in the face of common sense."

So that is *that*, and Mr. H. J. Cash, whose work in connection with both registration and regulations is so well known, and which work gives his opinions peculiar weight, rubs it in by saying, in the same issue of the same paper, "To seek a remedy through compulsory registration is to follow a will-o'-the-wisp; that compulsory wiring rules are the only solution, and the E.C.A. should press for them on all occasions."

Registration Essential.

The reason given in the communicated article above referred to as to why compulsory registration cannot be effected without compulsory rules is that "no Government could possibly give authority to any professional organisation to add or delete a name to or from any compulsory register of installation contractors unless the rules to which registered men are required to work had first been agreed and officially imposed on the trade."

This I am not quite satisfied about. Do doctors, dentists, etc., have to conform to certain working rules in their profession? Do they not consider the spirit of things rather than the letter, and can we not visualise contractors, registered or licensed, under much the same conditions? It is generally conceded that registration is an absolute necessity in connection with the problem under consideration, but Mr. Morris, in his article mentioned above, goes further and says:—

> "It is of far more importance to life that electrical contractors should be registered than either architects or opticians. I contend that it is of far greater importance that we should be registered than members of either of these professions, and I submit that it is in the interest of the nation that electrical contractors should be registered, equally as much as dispensing chemists."

With this view I find myself in complete agreement, but I am authoritatively told that I am wrong, and that before anything can be done in this matter I must be saddled with a whole lot of compulsory wiring regulations.

Regarding the reason given above as to why compulsory rules must precede compulsory registration, does not the Register already possess this autocratic power? In some

Digitized by Google

localities where assisted wiring schemes are in operation, registered contractors *only* are considered in connection with this work, and to all intents and purposes the Register operates as a compulsory measure in these districts for many contractors. Yet sufficient power is possessed under paragraph 10 (clause b) of the Register's Rules and Conditions to put men engaged in this work practically out of business: this paragraph states, "if it is proved to the satisfaction of the Executive Committee that he (the contractor) has culpably or negligently created a risk to life or limb, or serious fire hazard through the use of faulty or improper materials or by faulty workmanship" then his name shall be removed from the Register.

Knowledge the Best Standard.

This seems to me to be comprehensive enough, without any further detail or specifying exactly what may or may not be done. A man's training and knowledge should be sufficient to enable him to steer clear of any trouble. For a really competent contractor no rules or regulations are required, and surely we need not consider the other sort? The only standard demanded for registration should be knowledge, not mere blind compliance with rules and regulations, and registration made compulsory on those lines. However, here I come up against opinions that are weightier than my own, and I should be glad of further guidance.

Assume for the moment, however, that we accept the view that compulsory registration is not possible without compulsory rules, what is our objection to these compulsory rules? Why can we not all agree that they are desirable, and why should we not, as Mr. Cash advises, press for them on all occasions?

The objections are many and deep-rooted, but I propose to take only the more important in detail. The first objection that arises is the fear that compulsory wiring rules carry with them a risk of inspection, to which most contractors are bitterly opposed. The late Mr. A. H. Allen, for many years technical editor of the "Electrical Review," at an E.C.A. London Branch meeting last year, ". . . asked members to consider very carefully before asking for drastic regulations. Regulations involved inspectors, thereby imposing further burdens on an industry already overburdened in this respect." But Mr. H. J. Cash, in the letter previously referred to, assures us that we need fear no such thing, ". . . most emphatically that compulsory wiring rules neither connote the appointing of inspectors nor conferring powers of inspection on supply authorities or other officials."

We should be only too happy to accept this as final, but our fears are not completely allayed when we find that inspection is being openly advocated in some quarters. We all remember the speech of the then president of the E.C.A., Mr. W. A. Shaw, when he said at Cheltenham, in connection with wiring regulations:

> All sections of the industry should unite with a view to obtaining a compulsory code of wiring rules, providing a standard below which no work would be permitted to be connected to the public mains. Such a scheme would carry with it full authority to electricity supply departments to inspect installation work in progress and to refuse connections to any work below the given standard.

I submit that such a state of affairs as depicted by Mr. Shaw is absolutely unthinkable—in fact it is put very clearly and forcibly in the communicated article to which I have already referred, and from which I propose to quote further. It is stated:

> Is it to be imagined that electrical contractors would tolerate inspection by supply authorities—in many cases their immediate competitors in electrical installation work? Confusion would be the worse confounded if supply authorities were given individual power to give their own fads or fancies legal standing in their own areas; and in the same way, any inspection powers given to local authorities in general terms would be equally disastrous.

This is undoubtedly the opinion of the majority of contractors, but I should point out that not only is it "imagined" but definitely advocated by Mr. Shaw in his Cheltenham speech, and I can find no evidence that it was seriously objected to by contractors attending the Conference, either at the time or since.

I cannot do better than quote the comment of a leading article in "Contact" (July 1928) on Mr. Shaw's speech. The article says:

> We can hardly agree that Mr. Shaw's method of enforcing the wiring rules is ideal. Would it not be better if the National Register of Electrical Installation Contractors had the handling of such a problem? Agreed it would be necessary to induce the Electricity Commissioners to make the wiring regulations compulsory, but, having attained that, could not the N.R.E.I.C. combine its duties of watching over the workmanship of its members with the enforcement of recognised wiring regulations? The National Register should appoint its inspectors, who would have the right to inspect any installation work in progress, and to report any instances of bad workmanship or evasion of the rules, and on both counts the supply undertaking could be advised of the position.

This is an interesting suggestion, and will be referred to again later.

It will be noted that the inspection of installations in progress appears to be taken as a necessary adjunct to compulsory rules, and I think this would generally be assumed to be the case, but it will be remembered that Mr. Cash assured us that compulsory rules "neither connote the appointing of inspectors nor conferring the powers of inspection." Again, in the communicated article, already extensively quoted, we find "no routine inspection as such is called for; there is no manner of need for routine inspection by supply authorities (which is entirely unthinkable) or by the I.E.E., the E.C.A., the National Register, or any other body."

Apparently, then, these rules are to be compulsory, but not compelled; will not that leave the position much where it is to-day, in which the rules are already morally compulsory, and where definitely specified are actually so, and yet are more honoured in the breach than in the observance? If regulations are not compelled by inspectors, will they be observed by the unscrupulous contractor? Will not a demand for inspection arise from the industry itself to put an end to unfair competition?

A further instance of the assumption that compulsory wiring rules mean inspection is provided by another leader of the industry, Mr. Donald Smeaton Munro, who, in a lecture to the Edinburgh Insurance Students' Circle, emphasised the fact that the only official safeguards in Britain for the consumer were embodied in the wiring recommendations of the I.E.E., and in the constitution of the National Register. He suggested that the insurance companies should play a real part in protecting the public and their property by insistence on attention to rules, which in the meantime were adopted in name only, and by "paying the expense of systematic inspection." Again, Mr. E. R. Morris, in an article on "Compulsory Registration" ("Electrical Contractor," February, 1929) says: ". . . . for any 'so-called' compulsory wiring rules to be enforced would require an inspector to sit on every job."

Inspection in Other Fields.

In view of these opinions I think I might have been forgiven for having assumed that compulsory regulations would mean inspection, but I am again told in many quarters that I am quite wrong (and so, incidentally, are all these gentlemen whose opinions I have quoted!), and that my intelligence is not devastating. Here again I should be glad of assistance, as I find that we have building regulations and consequently building inspectors; Government and local authority regulations concerning water and drainage systems, and a standing army of sanitary inspectors; Home Office regulations for factories and workshops. and consequently inspectors. But I am most solemnly assured that electrical regulations will not mean electrical inspectors! That this question of inspection, even in its worst form, i.e., by local authorities, is not feared in some quarters is proved, firstly by Mr. Shaw's public demand for it, and secondly by the fact that the contractors of Leicester have already approached the Electricity Department to institute a system of inspection! Luckily for them, I think, the Department did not agree, not being prepared to accept this responsibility.

Then we have Mr. Penwill, the secretary of the E.C.A., at a meeting of the East Kent Branch, of which it is reported that "Mr. Penwill referred to an 'interesting' suggestion that an independent local inspector of wiring should be appointed by the magistrates of the area under their jurisdiction." It was not Mr. Penwill's suggestion, but neither was it condemned out of hand by the meeting, which is also interesting.

If compulsory wiring rules *should* imply inspection, let us at all costs keep such inspection more or less under our own control, somewhat on the lines suggested in the above-quoted criticisms from "Contact." But unfortunately we cannot look to the N.R.E.I.C. for the institution of such a system of inspection, for the Register does not at the moment agree to the imposition of any compulsory rules. In the report of the Executive Committee of the N.R.E.I.C. for 1928 we find the following:—

Digitized by Google

The adoption of wiring regulations has been a constant subject of consideration and discussion, but your executive committee are still of the opinion that the time has not yet arrived for making compulsory a set of such regulations.

And yet on this executive committee serve the two gentlemen whose opinions I have already quoted as advocating compulsory regulations; in fact there should appear to be a majority on this committee in favour of compulsory regulations if they are really of the value that they are alleged to be, the composition of the committee being as follows: Representing I.M.E.A., 4; representing contractors, 4; representing consulting engineers, 1; representing I.E.E., 1 (chairman).

Although the Register is not prepared to tell me what I shall do, it will to a certain extent, enlighten me as to what I may *not* do; it is difficult to say how a thing should be done, but easier to say how it should *not* be done. A list of heinous crimes has, therefore, been issued to all registered contractors, the commission of any one of which will be sufficient to hurl them into outer darkness. One of these crimes (No. 3) is "leaving the ends of tubes at switch points, etc., without suitable bushings."

Now I am rather worried as to how the Register will know that I am, possibly, omitting bushings from my tubes, without coming and inspecting my jobs; we all know that the 30 years old jobs that we are pulling out to-day and rewiring possessed no bushes on the tubes (if any). Am I to wait for 30 years before I am removed from the Register because, with good workmanship, no trouble will result on the jobs, bushes or no bushes? In this connection another "interesting" suggestion was made in a letter to the "Electrical Review" (August 2, 1929) that the Register could be assisted in this direction by members of the E.T.U., who would presumably, being themselves without sin, report the wicked contractor to the Register. Words fail me as suitable comment here, but the writer of the letter was apparently quite serious in his suggestion.

I think the real reason, however, for the Register's refusal to countenance compulsory rules at a time when registration is purely voluntary is that it would handicap registered contractors from a competitive point of view. If this is so, this is a real argument as to the necessity for compulsory rules, although I shall quote Mr. Cash later as saying that standard rules will not increase wiring costs; also it is stated in "Electrical Security" (p. 24) "The Code (I.E.E.) does not increase the cost of a sound and dependable installation," and as presumably registered contractors already put in "sound and dependable" installations, it is rather difficult to see how the code, made compulsory, can do other than benefit those contractors.

Be the reason what it may, the Register will have no compulsory regulations, which, as pointed out above, is especially puzzling in view of the composition of the Executive Committee.

The Local Authority Position.

Coming back to the question of inspection, if we *still* fear, in spite of assurances to the contrary, that this may be carried out by local authorities, could we not persuade such local authorities to adopt some recognised code, say, the I.E.E. regulations, and enforce these only, leaving out of the question their own "fads and fancies"? But here again we appear to be stumped, for Mr. H. J. Cash, who speaks with authority from his long work on regulations, says in the "Electrical Contractor" for September, 1929:—

> I believe the supply authorities are for the most part in two camps on this matter of compulsory wiring rules. One section believes that it would involve the authorities in the responsibility of inspection, and they object to being so involved. The other section objects to being governed by any rules other than those drawn up by their own engineer, and believes quite erroneously that standard rules must inevitably increase wiring costs. Both these sections consequently are united in opposition (with a few exceptions) to a compulsory code.

I can well understand, for the reasons given, and many others, the supply authorities' opposition to compulsory regulations; after all, the "kerbstoner" is of just as much immediate use to them as the legitimate contractor, and possibly, in the mass, more so. I can also understand the N.R.E.I.C not giving this proposal their support, in view of the possible handicap to registered contractors, but I cannot understand why a bigger official push has not been made in this direction by the E.C.A., if compulsory regulations are such a desirable thing. Apart from Mr. Shaw's Cheltenham speech and Mr. Walton's reference at the E.C.A. dinner already referred to, when he mentioned "wiring rules to be observed, under penalty," the only things I have heard that it is considered necessary to make compulsory are certain earthing regulations.

Assuming that the inspection bogey has been killed once and for all, and I am willing to be convinced of this, are there any other objections to compulsory regulations alone as a remedy for the present state of affairs?

Vital Questions Untouched.

My own serious objection to wiring regulations alone is that they do not go nearly far enough, as they leave absolutely untouched the vital question of workmanship on the part of the mechanic, and of knowledge in the upper ranks of the contracting firm. This view is again supported by Mr. E. R. Morris, in the article previously referred to, when he says:—

> Compulsory wiring rules are all right as far as they go, but they do not go very far, in fact, they scarcely make a start. A man who is out to do shoddy work will take jolly good care to hide it under the floor boards, and make his "sore-finger" joints in tubes, etc., at the same time taking care that what small proportion of his work *is* visible shall come up to the requirements of any rules which may be in force.

This is perfectly true, and, further, the average grade of wiring material in use to-day is so good, not even excluding foreign cable, that this shoddy work will pass muster and tests, and probably be trouble-free for many years; the unscrupulous contractor will once again get away with it in spite of compulsory rules. I know of two cases near our own town: one, that of a jeweller who went into a radio side line at the time of the boom and is now an "electrical engineer"; and the other, that of an assistant in a purely radio business which failed, and who is also now an "electrical engineer," although his knowledge is such that he cannot correctly describe everyday materials that he occasionally requisitions from us. Compulsory rules alone will let both of these men in, although their electrical knowledge is of the most meagre description, and they will go on handling the domestic a.c. with the *assistance* of the regulations, which will be mainly news to them and of great help. This may make for the betterment of their individual work somewhat, but I fail to see how this can improve the general conditions of the industry; here again, perhaps, some of the enlightenment that I am craving may be vouchsafed to me. Neither of these cases could qualify for registration.

Good electrical installation work seems to me to be 80 per cent. workmanship and 20 per cent. material; the good mechanic will always beat the inferior for safety and reliability on his jobs, even if the odds are against him as regards the quality of material, or system employed. I should place the three main factors making for safety and reliability in electrical installations as follows: first, workmanship; second, lay-out; and third, material or system. As the first two really amount to the same thing—knowledge, surely any steps taken to improve the general quality of installation work should concentrate on these two main factors, and not merely on materials or systems, which is all that compulsory regulations can do.

This point of view is supported by a recent article in the "Electrical Review" ("Electricity in Holland," J. H. Mortimer, August 23rd, 1929), in which it is stated:—

> Slack though this attitude may appear to be, it places an onus on the consumer, the architect and the contractor, which induces far more careful consideration than do our somewhat overwhelming Rules and Regulations. The latter seem to lull us into a sense of false security from which our Dutch friends are entirely free. I do not for one moment suggest that we should do away with our rules, but I do feel that we need to realise that they cannot always be rigidly applied, and that in addition to them co-operation is vitally necessary, so that they may be obeyed in spirit oftentimes rather than in letter.

In other words, the less rules, the more brains.

This is undoubtedly, in my view, the commonsense attitude to take in regard to regulations; just imagine for one moment the Golden Rule made absolutely compulsory!

It will be noted that my own conclusions are that registration is imperative; without regulations, if possible; if not, then with regulations. The conditions of registration under the N.R.E.I.C. are undoubtedly on the right lines, stressing as they do the need for practical knowledge rather than merely blind compliance with regulations. *Cannot* we have this possession of knowledge made compulsory without having to conform to compulsory rules? "Yes," says Mr. Morris. "No," says Mr. Cash, "this is illogical." Very well, then, if we must have compulsory regulations as well, are we to suffer under inspection by supply authorities or other bodies?

C

Digitized by Google

"Yes," says Mr. Shaw, Mr. Munro, the late Mr. Allen, and others. "No," again says Mr. Cash. Even if we do not suffer inspection, are compulsory regulations desirable? "Yes," say Mr. Cash and Mr. Munro (both on the same side now, and both on the N.R.E.I.C. executive); "No," say the N.R.E.I.C. executive, the supply authorities, and very many installation engineers.

It is all very confusing, and, so far, nothing has been said as to the possibility of finding a code of wiring rules that will be accepted without question by all contractors, seeing how widely wiring practice varies in different parts of the country. There is not much doubt that the code proposed for universal acceptance will be the Ninth Edition of the I.E.E. "Regulations for the Electrical Equipment of Buildings," but these would not find absolute acceptance in their entirety. That this is so is recognised in the latest E.C.A. publication, "Electrical Security," where it is stated, in a chapter on "Earthed Equipment," that :—

> At the present moment electrical engineers are not entirely agreed concerning the necessity to earth all domestic equipment, no matter in what part of the house such apparatus is used.

This rather understates the case, as there is active opposition to the earthing clauses in some quarters, and I do not propose to enter into this controversy here beyond stating that fact; but obviously this opposition will have to be overcome before any universal code of wiring rules can be imposed upon installation engineers. Should it be agreed, however, that compulsory rules *are* essential to our well-being, I do not look upon this divergence of opinion as a very serious matter, for probably most contractors would be willing to sink their differences as to detail for the general improvement of the industry. In any case, as regards the clauses around which controversy rages, these could probably be amended so as to suit both sides.

Anyone who has the patience to read through these notes will see how very perplexing the present position is, and how necessary it is for a clear policy to be formulated before any active steps can be taken to bring about the much-desired improvement in our industry. The average rank and file contractors are all pulling in different ways at the moment, but their efforts could be made very effective were they only co-ordinated. The individual contractors can do a great deal in this matter by working through their local Chamber of Commerce or Chamber of Trade, but chiefly, of course, by becoming themselves voluntarily registered. Until the Register can show that it comprises, say, 75 per cent. of the reputable contractors of the country, it will never be in a sufficiently strong position to consider compulsory proposals in any direction.

That contractors would respond with alacrity to any clear-cut policy, definitely formulated, is certain, and it appears to be essential that this policy be considered at the earliest possible opportunity. Individual efforts are simply being wasted at the moment owing to the chaotic ideas prevailing, and we should all welcome an electrical Mussolini who would, however drastically or autocratically, divert all our efforts into one main channel, even if it meant the complete extinction politically of the Bolsheviks in the industry, of which select body the present writer would undoubtedly be considered to be a member.

THE ELECTRICAL CONTRACTOR AND THE REGIONAL BROADCASTING SCHEME.

The Problem of Programme Separation—Questions the Contractor Will Need to Answer —Simple Methods for Improving Selectivity.

By "RADICON."

WHEREAS the aim of the British Broadcasting Corporation has hitherto been to provide a single programme service for each of a large number of transmitting stations situated in the various important centres of the United Kingdom, the regional scheme may be regarded as a more economical method of doing the same thing, with the difference that fewer stations of larger power will be operated. These stations will be erected at suitable distances from the large towns, and each will be provided with two transmitters radiating different programmes on wavelengths sufficiently different in amplitude to permit of either programme being received without interference from the other, subject to the receiver being reasonably selective.

The first of the regional stations, namely, Brookman's Park, has been carrying out tests for the last month, using only one transmitter and a wavelength of 356·3 metres. The second transmitter will come into operation shortly, and will be heard on a wavelength of 261·3 metres. Listeners within range of Brookman's Park will thus have the choice of two programmes, assuming, of course, that the receiver is not so flat in its tuning that both programmes are heard simultaneously.

In the present circumstances southern listeners have as their alternative programme that provided by 5GB, and though in the majority of cases it is possible to separate 2LO from 5GB, this does not signify that similar separation of the two Brookman's Park programmes is a foregone conclusion when using the same receiver.

In anticipation of this difficulty, it is proposed to discuss in detail a few simple methods of improving the selectivity of circuits which are likely to prove inadequate in the matter of sharp tuning under the new conditions, and to suggest to electrical contractors suitable alterations and additions which may be passed on in answer to the queries which are sure to arise.

In the first place, it may be taken that any valve receiver of modern design, or any published valve circuit of recent origin will, with very few exceptions, do the work expected of it. In cases where it does not, the fault is more likely to be a wrong adjustment or connection than a fundamental error in the apparatus or circuit.

The receivers which are likely to give most trouble are (1) crystal sets, (2) single valve sets, and (3) multi-valve sets using direct aerial coupling, a good many of which are still in use. Next on the list of doubtful equipment come (*a*) sets employing high-frequency amplification, and possessing large natural "pick-up" tendencies such as are found in the old tuned anode, potentiometer-controlled arrangement, (*b*) early type sets incorporating multi-wave tuning devices of the tapped inductance variety, for both aerial and anode circuit tuning, the whole being stabilised either by a resistance in the first grid circuit or positive bias being applied to the h.f. valve, and (*c*) sets incorporating a single untuned transformer-coupled high-frequency stage covering the 250–550 metre waveband and a variably coupled aerial circuit.

It will be appreciated that space will not permit of every improvement being given to each of the receivers enumerated, and we will take as the first examples the sets classed as (1), (2) and (3).

The majority of crystal sets use the circuit shown in Fig. 1, the inductance L1 being a plug-in coil, and C1 a variable 0·0005 μF condenser. With such a circuit the separation of two programmes emanating from a regional station is highly problematic and the arrangements of Figs. 2 and 3 are suggested, the original circuit retaining the same references as in Fig. 1. In the case of Fig. 2, the inductance L1 should be a No. 60 plug-in coil tuned by the same condenser C1, and L2 should be a No. 35 or 50 coil tuned by another 0·0005μF variable condenser, C2. The two coils, L1, and L2 should be variably coupled by means of a two coil holder, the wider apart the coils, or, in other words, the looser the coupling, the greater the chance of separating the programmes. The operation of this arrangement is obviously less simple than that of Fig. 1, but it will generally be found that, unless the receiver is very near the location of the transmitters, the two programmes may be separated without any great loss of signal strength. The coupling of L1 and L2 will vary with each wavelength, as well as with every alteration of the readings on the condensers, but once the optimum couplings for the two programmes are found, final adjustments of the condenser vanes are quickly made. Readjustment of the crystal setting

again necessitates some slight tuning adjustment in most cases.

The circuit arrangement shown in Fig. 3 is another simple method of improving crystal set selectivity with the advantage that no additional tuning control is added. The coil L1 may be of the cylindrical type or it may be one of the popular plug-in series. In the case of the former it should consist of about 50 to 60 turns of No. 22 d.c.c. wire wound on a 3-in. former, or, if plug-in coils are used, a No. 60 coil will suffice. The inductance L2 consists of 10 or 20 turns wound over L1 in the case of a cylindrical coil, or as tightly coupled as possible in the case of a plug-in coil. The number of turns for the inductance L2 is best found by trial and error in order that the best compromise between loss of signal strength and selectivity may be reached.

Single Valve Circuits.

Receivers consisting of single valve circuits or rectifying valves followed by low frequency amplifiers are again likely to prove unselective if the set is of the old type. A circuit which was very popular a few years ago is shown in Fig. 4, and, though this is a single valve arrangement, many old designs added to this one on two low frequency stages. For the purpose of selectivity, however, these have been ignored for obvious reasons. The direct coupled aerial circuit is indicated by L1, C1 and the dotted lines, and in a very few cases will such an arrangement prove good enough under the regional scheme. The simplest way out of the difficulty is to try the addition of L2. Receivers using the Fig. 4 circuit more often than not utilise plug-in coils and, in order that the circuit may prove more suitable for modern conditions, it is suggested that L1 be a No. 60 coil and L2 a No. 35 or less, loosely coupled to L1 with the low potential end of L1 connected to L2 as shown. This arrangement will be effective in some cases though not in all, and, in the latter circumstances, a small fixed condenser (0·0001 μF) should be connected in series with L2 at the high potential end of the aerial-earth circuit, trying also the effect of a larger coil.

The operation of the set will be the same as originally, with the exception that the circuit will be more sensitive with respect to reaction coupling, and in most cases it will be found advisable to reduce the size of the coil so that adjustment is less " floppy " and " sticky." The coupling between L1 and L2 should be found by experiment, bearing in mind that the looser the coupling, that is the wider apart the coils, the greater the selectivity. It will generally be found, however, that an optimum coupling suitable for all wavelengths covered by the particular inductance and capacity is the most convenient.

Those receivers which incorporate the so-called " Reinartz " method of reaction and the inductively coupled aerial circuit of Fig. 4a can have their selective properties improved by a reduction, within limits, of the number of turns in the coil L1, or alternatively by varying the coupling between L1 and L2.

On the other hand, circuits of the type shown in Fig. 4b will probably require more attention, and the arrangement of Fig. 4c is suggested. The difficulty with the Fig. 4b circuit would lie in the coil L2, and any reduction in the number of turns with a view to improving selectivity would in all probability upset the reaction adjustments in such a way that the set would either not oscillate at all, or only on the lower wavelengths. Fig 4c shows a method of overcoming the difficulty, and though not perfect from a theoretical point of view, it nevertheless affords a means of reducing the aerial coupling with consequent improvement in selectivity without substantially altering the original arrangement. Sets using this form of circuit will generally be found to incorporate a cylindrical type of inductance, and it should prove a simple matter to make the tappings as suggested, every five or so turns.

Multi-Valve Receivers.

Multi-valve receivers incorporating high-frequency valves, with direct aerial coupling, and receivers utilising old type multi-wavelength tuners present a problem somewhat different from the cases previously dealt with. Early receivers employing high-frequency amplification would probably become unstable if any attempt were made at inductively coupling the aerial, and for this reason it is suggested that one of the three arrangements, Figs. 5, 6 or 7, be used.

In all three cases the additional apparatus is external to the set, and may, if desired, be housed in a small box near to the receiver. From the point of view of construction the first, Fig. 5, is the easiest, consisting as it does of a No. 50 or 60 plug-in coil with a 0·0005 μF variable condenser in parallel. The connections are made as indicated in the figure, and with the condenser C1 set to its zero reading the desired programme should be tuned in on the set in the normal way, irrespective of interference from other stations or from the other " regional programme." When the required signals have been tuned to their maximum volume, turning the C1 condenser slowly will soon result in a position being found where " the interfering programmes " either become inaudible or of such weak strength as to be " lost " in the more powerful signals of the wanted programme, whereupon the set should be retuned.

This addition will be found very useful in a number of cases, but not in all, for its success is largely dependent upon the aerial arrangements and the aerial-earth circuit of the receiver. It may, however, be tried with any receiver, irrespective of the number of valves used, where the first grid circuit is either directly coupled to the aerial, or where simple inductive coupling is used.

Another somewhat similar arangement is shown in Fig. 6, but in this case the coils will be required to be wound. L2, consisting of 40 turns of No. 26 d.c.c. wire, is wound on a 3 in. former with L1, consisting of 8 or 10 turns of the same gauge wire wound over it. The coil L2 is tuned by a 0·0005 μF condenser in parallel, and the connections are as in Fig. 6. The operation of both the added circuit and of the set itself is the same as with the Fig. 5 arrangement, tuning will, however, be more critical.

Still another form of additional circuit which may be used is that of Fig. 7, and as in the case of Fig. 6 this will require to be made. L2, consisting of 40 turns of No. 26 d.c.c. is wound on a 3 in. former, with L1, consisting of 4 or 5 turns of the same wire wound over it. L2 is tuned by a 0·0005 μF condenser connected in parallel as before, and L1 is connected directly across the aerial and earth terminals of the set. The operation of the Fig. 7 arrangement is again the same as Fig. 5, but it will generally be found that tuning is sharp and definite.

Proximity to Station.

It will be appreciated that the selectivity problem is largely wrapped up in the proximity of the set to the regional station, and though a listener, say, in South London is able to separate 5GB from Brookman's Park in the present circumstances, the fact that the two Brookman's Park programmes will be transmitted over the same distance and from the same direction may be sufficient to break down the selectivity enjoyed in the case of 5GB and 2LO. The wavelengths to be used by the London regional station are sufficiently wide apart to eliminate any difficulty with practically any modern receiver, and of sufficiently different amplitudes to enable the simplest of improvements to all apparatus to be effective, except in those cases where the transmitters are within the immediate vicinity of the receiver.

The suggestions given are purely in relation to programme separation, and will not in any circumstances permit of a regional station being received at greater volume. Where reception proves to be weaker under the regional scheme than at present, then contractors should advise the adding of a high-frequency valve to existing apparatus, providing that not more than one is already in use. Better still, the utilisation of a modern receiver should be recommended.

TELEPHONE PROGRESS IN IRELAND.

Rapid Growth in Internal and Cross-Channel Traffic.

THE following statistics relating to the growth of the telephone service in the Irish Free State have been issued. In 1922, 104 exchanges and 552 call offices were in operation. Local calls numbered 10 000 000 and trunk calls 77 700. By the close of 1928 there were 678 exchanges and 1 165 call offices in operation, while the number of local calls had grown to 19 265 000 and the number of trunk calls to 177 450. Dublin has now 5 000 automatic telephones in use, and arrangements have been made by the Post Office to have 6 175 installed, with 5 575 extensions, in the next few months. This increase in automatic telephones was decided on after subscribers with a lengthy experience of the system had been consulted as to whether the whole of Dublin should be turned over to automatic working. Sixty per cent. voted, and of these ninety per cent. were in favour. In 1925 there was only one trunk circuit to Cork ; now there are three. The telephone service to England has doubled, and about 15 calls are now put through between Dublin and Liverpool or London in a normally busy hour.

ANIMATION IN SHOP WINDOW DISPLAY.

Some Hints for Electrical Contractors—Boomerang Effect of Fake Displays—Demonstrating Cooker Service—A Fire Display Scheme.

By CYRIL SYLVESTER, A.M.I.E.E., A.M.I.Mech.E.

THERE is something fascinating about movement. It is an indication of life, of activity. Its attractiveness is realised and exploited in almost every phase of commercial life. An animated sign of the simplest form, where electric light illuminates a sign for a few seconds through the medium of a thermo-flasher, will attract attention. The more elaborate signs, with animated figures and running borders, are so popular as to be termed " sights " ; Piccadilly Circus at night time is an example of this. Even in a shop window display a revolving dressed figure in a tailor's shop will attract more attention than a similar model which is lifeless.

In the electrical business, movement in a shop window display as an attractive medium is realised. In the summer time we see electric fans blowing balloons about in a window, and various coloured silk streamers move about in an attractive manner. A washing machine " in operation " has been proved to be a greater attraction than one which is just " on show " ; one upon which is fixed a card bearing the bald statement that a washing machine is a labour-saving device.

But we in the electrical business are faced with greater problems than many of those in other businesses. Our business is not of the same class throughout the year. A confectioner sells the same class of goods winter and summer. The tailor displays clothes in his shop window winter and summer ; his revolving figure is suitable as an attractive medium all the year round. All he has to do is to change summer garments for winter ones, and *vice versa*.

We, obviously, cannot display fans in the winter time ; in the same way we cannot very well display electric fires in the summer months. If, therefore, our shop windows are to be attractive through an animated medium, not only the class of display must be altered, but also the method adopted to draw attention to it must be changed.

To produce animation in a display of winter electrical goods is a problem, and one that is not too readily solved. Such domestic appliances as electric cookers, kettles and fires are unusually static in appearance. One thing is certain, and this is that the display must be genuine ; that is, not a stunt. By this I mean that the animation when introduced into the display must have some bearing upon the capabilities of the goods to which it is intended to attract attention.

Abroad, especially in America, methods are adopted to attract attention to a shop window display, which have no bearing whatever upon the goods to be sold. It is considered that once attention is drawn to a shop window the viewer becomes a potential customer. This may be so, but if the display is faked, it may have quite the opposite effect.

Misplaced Ingenuity.

To mention a case in point, I remember seeing in Pittsburg (Pa.) a display of electric lamps ; the method adopted to draw attention to this display was a fake. A large kettle was suspended in the middle of the display ; it was tilted at an angle, and an endless stream of water was *apparently* passing from the spout into a large basin located on the floor of the window. This was certainly an animated display and attention was attracted ; everyone was curious to know where the water was coming from, and this was about the extent of the value of the display. The solution of the illusion was simple. A small glass tube was connected between the spout of the kettle and a hole in the bottom of the basin ; the latter had a double bottom which contained water. A small pump forced the water from the basin up the glass tube into the spout of the kettle ; here it flowed over the top of the tube and down the outside, thus creating the illusion of a continuous stream. This display was out of place ; it was entirely unconnected with electric lamps.

It is not at all difficult to produce an animated display of the qualities of electric lamps. Lamps can be made into various designs and their circuits connected to flashers ; here we have animation at its best.

Again, colour is an excellent attractive medium. In Switzerland, some time ago, I saw one of the simplest and most effective displays that could possibly be devised to attract attention to the capabilities of coloured lamps. A number of coloured lamps, fitted in various reflectors, were connected to a flasher. In the centre of the display, upon a stand, was a piece of red velvet. Intermittent beams of coloured light were projected upon the cloth ; the attractive feature was that the material appeared to change in colour as the various coloured beams of light were intercepted by it. The object of this display was not only to show how some colours will enhance the appearance of coloured furnishings in the home, but to illustrate how the indiscriminate use of coloured light will detract from their appearance.

A Practical Cooker Display.

Referring to the more static of domestic appliances, say, an electric cooker and a kettle, these can be made the medium of an excellent animated display, and one which has a distinct bearing upon the uses of the appliances. To place a kettle upon a cooker has no attractive merits ; this is its usual place and, as such, would be passed unnoticed. If, however, the kettle is filled with water which has reached boiling point, the display immediately becomes an animated one. No person passing such a display could resist looking at the steam issuing from the kettle spout. Such a display shows the cause and effect of both the cooker and kettle. The cause is the " clean " heat, generated by electricity, transferred from the hotplate to the water ; the effect is the boiling water manifest in the form of steam.

Most winter domestic electrical appliances do not lend themselves to any form of animated display alone.

Let us take, for instance, the case of electric fires. These alone, whether in use or not, do not form a very attractive medium. An installation of a miniature cinematograph, however, can readily be made to form the connecting link between the display, the usefulness of the goods and their efficiency. I saw such a combined display in Paris a few months ago.

In a large shop window was a display of electric fires, both ordinary and ornamental. On the background was a small screen upon which animated pictures were projected at periods of about half a minute. The message of each picture was a different one. The chief points brought out were cleanliness, convenience and high efficiency. One picture would show a lady carrying a scuttle of coal to a fire ; as a contrast, the same lady was seen switching on the current to an electric fire.

Another picture would show a maid cleaning ashes from an ordinary coal fireplace ; the contrast was that she was seen merely dusting an electric fire. Another picture would show a maid looking up and down a snow-clad road waiting for the arrival of the coalman ; the contrast was the same maid closing the main switch of the electricity supply. Another picture would show the maid lighting coal fires in various rooms of the house ; the contrast was the maid carrying an electric fire from one room to another ; and so on.

During the projection of the pictures the lighting units in the window were dimmed. After each picture the bright lights upon the display emphasised in no uncertain manner the benefits of electricity as a heating medium. That the display was an attractive one there is no doubt ; this was manifest from the crowds which gathered round the window. And this is all that matters, since the sale of goods commences outside the shop—at the display window.

CONTRACTORS AND THE E.T.B.I.

WE are glad to draw attention to the effort which is being made by the London Branch of the Electrical Contractors' Association to help swell the funds of the Electrical Trades' Benevolent Institution. This will take the form of a Ball and Cabaret to be held at the Portman Rooms, 57, Baker Street, London, on Thursday, November 7th, at 8 p.m., at which it is hoped a large number from all sections of the industry will be present. Tickets are priced at 15s. each, but it is pointed out that dance tickets are usually sold in pairs. In addition to dancing, there will be some first-class cabaret turns, and a lucky number competition, for which interesting prizes are being given. Refreshments will be provided, and special garage accommodation has been arranged in close proximity to the hall. Tickets may be had from Mr. C. H. Flower, chairman of the London Branch, or from Mr. L. C. Penwill, at 15, Savoy Street, W.C.2.

MODERN LIGHTING FITTINGS.

Notable Tendencies in Styles Available for the Autumn and Winter Season—Prevalence of Cubist and Cylindrical Forms.

READERS who have followed the numerous articles in these columns on modern lighting fittings design will be familiar with the general lines of present day development. The following notes are intended to give a general idea of tendencies noticeable in the productions available for the autumn and winter season.

In the first place it is becoming increasingly plain that the interdependence of two distinct sides of illumination—the engineering, which studies light distribution, diffusion, shadow elimination and efficiency, and the artistic, which deals with many visual problems not to be stated so concisely—is now realised much more definitely than previously.

The Geometrical Style.

Moreover, instead of designing fittings with one eye to the lighting qualities, and the other to appearance, as has frequently been done until recently, the latest practice appears to be to decide first just what lighting qualities are desirable, and then work from that, leaving the attractive appearance of the fitting to develop incidentally. Indeed, in many recent designs, there is more cleanness and originality than beauty in the sense of prettiness. It seems more to be the aim to startle and fascinate by novelty than to win by conventional loveliness. The cubist—or at all events geometrical—style is well to the front, and a particularly popular figure just now is the cylinder which enters into pendants and wall brackets with surprising aplomb. The cubist fashion has one great commercial advantage over other styles; the less elaborate fittings may be made up of several units, or of combinations of different units, and thus in the long run a great deal of expense may be saved.

The units may consist of glass boxes, cubic or rectangular, of spheres, cylinders, or even simple segments of geometrical shapes—to be adapted as afterwards desired.

In the case of pressed glass the monetary saving effected by this means is very great, as the principal expense in the production of pressed glass is the cost of the moulds. When the same design can be employed as the basis not only of numerous different types of pendants, but of pillar and cornice lighting also, the benefit to the slimmer-pursed sections of the community is obviously substantial.

As is well known, the drawback to some of the most beautiful modern fittings is often the very high price, which prevents such examples of the art being possessed by any but the favoured few; any device, therefore, that will make artistic fittings obtainable by the majority of electric light consumers is to be welcomed, even if it entails a certain degree of standardisation. It is hard indeed to have to return home from a showroom of tantalisingly attractive pendants to a crude bowl fitting—however much one used to admire the latter in comparison with the naked lamp of yesteryear.

Some months ago we gave a short account of the current designs of several well-known lighting specialists in London. It will probably interest contractors to hear something of the present tendencies in equipment produced by one or two of the same firms.

In some instances, as that of Best and Lloyd, Ltd., of 40, Great Marlborough Street, W.1, there has been little change since the spring. If anything, designs seem to be becoming more simplified, as the two illustrations (Figs. 6 and 8) may indicate. The pendant has a diameter of 18 inches, obscured rimpled plates and satined cylinder. Such metal work as shows is of brass. The wall bracket, which is stated to be a very popular example of the clean-cut type of mural lamp, is 15 inches long by seven and a quarter wide; many other sizes are, of course, available. The particular model illustrated is constructed with a triangular cross-section for fitting into a corner. These brackets can be had in either obscured rimpled or the firm's special "Firelight" glass. The latter is produced by a hand-spraying process on obscured rimpled glass, giving graduated tones merging from orange into pale yellow. The panes are removable.

On the opposite page will be seen several examples of the latest creations of Troughton and Young, Ltd., of 143, Knightsbridge, S.W.1. Fig. 2, which struck us as being one of the most generally useful pendants in the showrooms—although not the most beautiful—is a good example of the cylindrical note now so much in vogue. The semi-cylinders are in white porcelain, while the inverted pyramid in the centre (which is more like part of a French fitting) may be had in different colours. The decorative motifs at the corners are in this case green. Silvered metal is used for the apex applied to the pyramid, and it will be noticed that here again the pyramidic shape is introduced. The colouring of Messrs. Troughton and Young's pendants is so delightful that no black and white reproductions can do them justice, but a vague idea of the artistic level reached by some of the designer's attempts is given by Fig. 9, and, to a lesser degree, by Fig. 7. It should be noted that a pendant of the form used in Fig. 9 reflects light in every direction, while at the same time the rays are sufficiently broken up to ensure a soft light. When a really subdued light is wanted alabaster still serves a purpose, though the more translucent silica is as a rule a better substitute for glass. But usually pressed glass is the most useful for the semi-opaque type of fitting, and the almost infinite variety of hues possible enable the colour scheme of any room to be suited.

The glass used for many of Troughton and Young's productions is French, but it is shaped in this country, where the fittings are both designed and manufactured.

In order to furnish an impression of the numerous kinds of lighting fittings obtainable, we give short descriptions of some typical models which are not illustrated here:

An egg-shaped, brownish-tinted pendant, intersected at right angles by two planes of white glass. A pendant consisting of four vertical cylinders touching along the axis of the fitting; decorative metal on the outside between each pair of cylinders. A table lamp with a base of decorated porcelain, forming a prism. A red and white pendant; the large square panel, which is horizontal and takes the place of a bowl, is white, and all the decorative adjuncts are red. A wall bracket consisting of a fluorescent white semi-cylinder brought out from the wall by concave glass segments, with silvered metal bordering. A large square pendant suspended by the corners, with the lamps arranged on the arc of a circle; the diffusion is excellent, and the just perceptible extra brilliance under the lamps gives a very pretty effect.

These are a few of the most arresting designs. There are also some almost amusingly unconventional wall lamps, definitely asymmetrical in form. Two cylinders, for instance, side by side, but set unevenly, so that one is higher than the other, and another, similar, but with a third cylinder, external to the basic pair—as if trying to hide their unevenness.

The Use of Colour.

Table lamps are present in a variety of novel styles—some with crackleware bases and celastoid or nacrolaque shades. But, as far as pendants are concerned, "slat" construction predominates. The many coloured projecting "leaves"—and indeed some of these fittings have a sort of floral significance—break up the light indirectly, and only absorb very little of it. The rationale—so far as there can be a rationale in artistic matters—of Messrs. Troughton and Young's wonderful designing seems to be principally the clever application of permutations and combinations to the trinity of line and form—proportion—and material.

To judge by the imposing list of well-known buildings in London in which during the last year Sabino glass has been utilised for lighting fittings, the attention now being paid by architects to this make of French glass must now be considerable. Messrs. Borghys and Ling (of 4, Warwick Court, Holborn, W.C.1), who market Sabino glass in London and Paris, are notable for the wide field of demand catered for by their supplies, which range from luxurious and expensive super-fittings to small and very reasonably-priced pendants and brackets for the home. In the Café de Paris, which has recently been redecorated by Messrs. Waring and Gillow, 110 exquisite boat-shaped fittings have been installed. Each fitting appears to consist of numerous small irregular figures—solid in the geometrical sense—each containing a lamp, and so arranged that no joints or metal work are visible. But it is vain to attempt to give an idea of their beauty in cold print—it is only possible to mention the construction, which depends essentially on internal bronze bands, circular in form, with projecting arms gripping each of the manifold units. Another beautiful and massive type of fitting is the 3 ft. 6 in. diameter

bowl, with the convex surface divided into ten panels of pressed and engraved glass. These bowls, which weigh upwards of 15 lb. each, have welded wrought-iron frames, and are suspended by heavy chains.

In these showrooms some most effective ceiling lights are to be seen: one we particularly noticed had flat, parallel sides and semi-circular ends, giving a simplicity not too complete to be pleasantly soothing. Canopy fittings are also well in evidence, and different combinations give many variations in their appearance.

Some very attractive—and very modern—fittings are on view in the new showrooms of Lighting Trades, Ltd., at Oriel House, Farringdon Street. A "parallel octagon" pendant in delicate tones of pink or blue is typical: there are four horizontal panels, all but the lowest pierced to receive the lamp. The fitting folds for packing. The decorative mounts forming part of the supporting frame are of sprayed metal. Wall brackets of sheet glass are somewhat similar to the pendants; a good feature is the interchangeability, which makes it possible for the owner to adapt his brackets to new whims or to harmonise with new decorations. Whatever the shape of the upper part of each glass slot, the width of the lower part gripped by the frame is always the same—hence colours and styles can be changed at will.

A NOVEL COOKER COMPETITION.

Exhibition Visitors asked to Estimate Cost of Electric Cooking for Set Menu for a Week—Joint Enterprise of Manufacturers and Contractors.

IN the selling of domestic electrical appliances in this country we have avoided the startling stunt methods so generally adopted in the United States of America, and consideration of the differences in the psychological make-up of the inhabitants of the two countries suggests that the avoidance of blatant stunting is a desirable feature in British electrical-selling methods.

But in our anxiety to avoid the ill effects of over-selling we are prone to go to the other extreme, and fail to make use of any "stunt," however good it may be.

Cooking one of the meals included in the competition described in the accompanying notes.

The scheme we are about to describe, which was carried out by Messrs. Galliers, of Brighton, in co-operation with the Credenda Conduits Co., Ltd., was more an educational than a directly selling "stunt," but the interest which it has aroused among the visitors to the Brighton Electrical Exhibition during the past few days clearly shows the attractive value of out-of-the-ordinary methods in selling domestic electrical appliances to the general public.

How It was Done.

On Messrs. Galliers' stand at the Exhibition was fixed a standard "Creda" cooker of a size suitable for from two to four persons. The cooker was connected up to the mains, and after the meter had been read by Mr. J. Christie, the borough electrical engineer of Brighton, the meter was specially sealed and the dial obscured.

Arrangements were made for the cooking in this cooker of meals typical of the requirements of an average middle-class family, every day for one week. The menus for the week were exhibited, and the food, all of which was actually cooked in the Exhibition, was displayed each day for public inspection.

Visitors to the stand were invited to estimate the total cost of cooking the whole of the food for the week, given a supply of energy at 1d. per kWh. At the conclusion of the Exhibition to-morrow (Saturday) the meter will be read, and the competitor whose estimate is nearest to that actually recorded will be awarded the cooker, which is listed at £12 5s.

In addition to the valuable publicity for electric cooking and the contractors and manufacturers who were jointly responsible for its promotion, the competition also assured that a very practical test of the actual cost of electric cooking—upon which so curiously misinformed ideas prevail—should be brought before the visitors.

Convincing Data.

In view of the practical aspect referred to above, we reproduce the week's menus in full. If these are utilised in conjunction with the cost figure, which we hope to announce next week, they should provide convincing data for those who desire to support their arguments that electric cooking is not expensive, by the incontrovertible evidence which this interesting competition furnishes.

The menus for the week were as follows:—

FRIDAY, OCTOBER 11TH.—*Breakfast:* Porridge, bacon, toast. *Lunch:* Steak and kidney pie, potatoes and cabbage, Queen pudding. *Tea:* Swiss roll, toast. *Supper:* Cheese and biscuits, tomatoes, cocoa. Hot water, 7 pints; hot milk, 1½ pints; hot water (washing up), 1 gallon.

SATURDAY, OCTOBER 12TH.—*Breakfast:* Force, bacon and tomatoes, toast. *Lunch:* Roast beef, baked potatoes, beans, lemon pie. *Tea:* Sandwiches, sponge cake. *Supper:* Cold beef, pickles, hot milk. Hot water, 7 pints; hot milk, 2 pints; hot water (washing up), 1 gallon.

SUNDAY, OCTOBER 13TH.—*Breakfast:* Grape Nuts, eggs, toast. *Lunch:* Cold beef, boiled potatoes, cauliflower, chocolate pudding. *Tea:* Fruit salad, cake. *Supper:* Cauliflower au gratin, cocoa. Hot water, 7 pints; hot milk, 1½ pints; hot water (washing up), 1 gallon.

MONDAY, OCTOBER 14TH.—*Breakfast:* Porridge, fish, toast. *Lunch:* Rissoles, chops, potatoes, turnips, fruit tart, custard. *Tea:* Hot toast, sponge cake. *Supper:* Cheese and biscuits, hot milk. Hot water, 7 pints; hot milk, 2 pints. Hot water (washing up), 1 gallon.

TUESDAY, OCTOBER 15TH.—*Breakfast:* Force, sausages, toast. *Lunch:* Fish, sauce, potatoes and beans, Leicester pudding. *Tea:* Boiled eggs, cake. *Supper:* Fish pie, cocoa. Hot water, 7 pints; hot milk, 1½ pints; hot water (washing up), 1 gallon.

WEDNESDAY, OCTOBER 16TH.—*Breakfast:* Grape Nuts, bacon, toast. *Lunch:* Mixed grill, chips, cabbage, pineapple pudding. *Tea:* Fruit tart, tea. *Supper:* Sandwiches, hot milk. Hot water, 7 pints; hot milk, 2 pints; hot water (washing up), 1 gallon.

THURSDAY, OCTOBER 17TH.—*Breakfast:* Porridge, fish, toast. *Lunch:* Liver and bacon, grilled tomatoes, potatoes, cauliflower, rice pudding. *Tea:* Sandwiches, small cakes, hot toast. *Supper:* Cold meat, pickles, cocoa. Hot water, 7 pints; hot milk, 1 pint; hot water (washing up), 1 gallon.

ADVERTISING FOR ELECTRICAL CONTRACTORS.

Preparing the "Copy"—The Opening Sentence—The Question of Type—Making the Most of Manufacturers' Sales-Aids in Local Campaigns.

By "PUBLICITY CONSULTANT."

"THE main thing is to get a really snappy phrase to start off an advertisement and so compel the interest of casual readers." So said an advertiser who ought to know better. A compelling opening is naturally desirable in everything that is expressible in words. In books and in conversation the picturesquely pertinent beginning that promises real and interesting information is a most desirable thing. In advertisements which are intended to reach the eyes of many who are not particularly anxious to read anything of the kind, the strong opening is all the more desirable.

Too many advertisers find extreme difficulty in getting down to their subject and in framing a telling phrase with which to start. The tendency to write a sort of introduction before launching out with the real purpose of the advertisement is far too noticeable in retailers' advertising to-day. Advertising space is too valuable to waste in this way. How can this unnecessary introduction be avoided? Chiefly, I have found, by first clearing the mind of any idea that the message is a piece of writing. Think, instead, that you are talking directly to a customer in the shop or showrooms. Think out and jot down roughly on paper the main arguments you would use to sell, say, an electric fire. Critical examination of these points will probably show, among the strong points, others which are either relatively unimpressive or mere repetitions of others. Rigorous pruning will reduce the lines of attack to the minimum, and upon this framework can be built up a forceful piece of copy shorn of the usual irrelevancies.

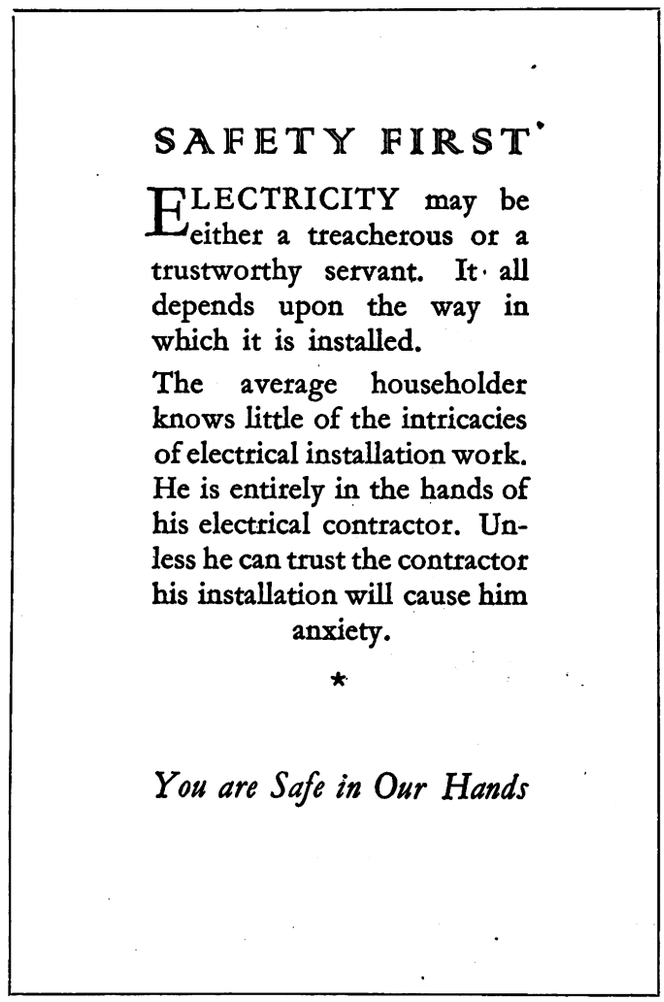
Some of my readers will have been wondering why I said that the author of the opening sentence in this article "ought to know better." Simply because he had sufficient experience of business and of advertising to know that a mere device to catch attention is valueless unless it is backed up by something that will hold that attention. He relied upon a merely clever phrase to bludgeon the unwilling reader, and then gave him nothing better than a string of inanities by way of consolation, and thus tended to create an attitude of distaste for that advertiser's products.

There are other dangers in the clever opening line or phrase, not the least of which is the ever-present possibility of an unintentional inversion of the idea that the advertiser has in mind. A typical instance was noticed in an exhibition catalogue the other day. An advertisement opened with the words "You cannot afford to leave the Exhibition without seeing the —— Electric Circulator." In this passage the first three words and the last three were printed in much larger type than the others, so that the natural tendency on the part of a casual reader would be to assume that he could not afford a —— electric circulator. Similar examples could be quoted, *ad nauseam*, so common is the habit of striving for initial effect without careful attention to the effect of the entire announcement.

In some of these cases it is not so much the wording as the incorrect use of different type sizes which causes the trouble by over-emphasising certain features and under-emphasising others. For instance, even in the example just referred to, the effect would have been less unfortunate if the large type passage had read "You cannot afford to leave the —— Electric Circulator."

The safest course to follow, however, is to avoid the use of phrases which, if read apart from their context by a hasty reader will link up negative or definitely bad qualities with the advertiser's name. A positive and unequivocal statement, even if it is not particularly smart or original, may frequently create a better impression in the mind of the headline reader. The eye is naturally attracted first by the strongest type and readily passes from one such emphasised portion to another which is similarly outstanding. It is therefore desirable that such deliberate underlinings should be planned so that even the most fleeting of readers will gain from it some definitely favourable impression.

I have stressed in earlier articles the very great advertising assistance which the electrical contractor may derive at little or no cost to himself from most of the electrical manufacturing firms. Well-produced booklets and folders, overprinted with the retailer's name and address, are a valuable aid in a local publicity campaign. Some can be handed to callers whether they make a purchase or not—for nobody should leave the shop without taking away some reminder of its existence and readiness to serve—while others can be enclosed with statements, quotations and circular letters. Proper distribution of these sales-helps is all too rarely encountered, and a little extra care in seeing that copies reach actual and potential customers,



SAFETY FIRST

ELECTRICITY may be either a treacherous or a trustworthy servant. It all depends upon the way in which it is installed.

The average householder knows little of the intricacies of electrical installation work. He is entirely in the hands of his electrical contractor. Unless he can trust the contractor his installation will cause him anxiety.

*

You are Safe in Our Hands

Fig. 1.—A page from a booklet issued by Thorpe and Bosco, Ltd. The type and layout are particularly good.

and are not wasted in street-corner distribution, is well worth while.

These productions cost the electrical manufacturers a considerable sum of money. Naturally, they are not philanthropists, and their proffered co-operation with the retailers is quite frankly for the purpose of selling more of their goods. By making it easier for the retailer to sell, the manufacturers act in the best interests of both.

Outstanding among recent efforts of this kind is a campaign for Siemen's radio batteries which has been planned in co-operation with Messrs. Industrial Publicity Services, Ltd. Apart from its practical value to co-operating retailers, the plan is of technical interest to students of advertising, and therefore warrants brief notice here. The scheme is based upon a cheery personage called Mr. Full O'Power, who, while possessing a normal human head, has a radio cell for body, and flex for arms and legs. This gentleman appears as the author of an attractive booklet giving "Inside Knowledge on the Correct Use of Radio Batteries," copies of which are available to retailers.

As the giver of useful information about the goods he has been created to sell, he is appearing in a series of Press advertisements, on the showcard illustrated in Fig. 2, and on a

Digitized by Google

window bill. In each case he offers copies of his informative booklet. An idea of the lines on which the Press advertising is proceeding may be gathered from the miniature reproduction seen in the Fig. 2. The use of these advertising figures has often been overdone ; many of them have been mere buffoons without a purpose in life. Mr. Full O' Power, however, performs a useful service, and his career during the next few months will be followed with interest.

Fig. 2.—A miniature reproduction of a newspaper advertisement incorporating Mr. Full O' Power.

Apart from newspaper advertising and booklets definitely intended to sell certain kinds of goods, many electrical contractors will often feel the need of a small brochure which will give to customers some idea of the business which issues it, and of its capability to do the work. Such a production is well worthy of careful designing, for upon its appearance much may depend. A good-looking booklet may suggest to the customer a good-looking job, carefully done, while thoughts of the opposite kind may easily be engendered by a mediocre production.

One of the best booklets of this kind that I have seen is one issued by Thorpe and Bosco, Ltd. Printed on cream matt paper, 5¾ in. deep by 3¾ in. wide, with a cover of ivory card, it is a model of good typography and concise but well-turned expression. On the inside pages of the cover, and on each left-hand page of the eight which comprise the booklet, are pasted half-tone reproductions in a sepia finish of notable installations carried out by the firm. Fig. 1 is a reproduction of one of the right-hand pages in the booklet, and from this I think that readers will agree that the copy is excellent and the typography of a high order.

The quality of the text is good throughout, but two outstandingly good examples may be quoted here as models of clear exposition in very small compass.

One, entitled "Good Materials," points out that "The materials used in electrical installations may be of good quality or they may be of bad quality. It is our practice to use British materials not only in the interests of national prosperity, but because their superior quality, in combination with the best craftsmanship makes it possible for us to guarantee all our work." Then, at the foot of the page, comes the italicised phrase, "Our Guarantee costs us nothing."

The second example is headed "Forethought," and goes on to say that "There are few trades in which lack of forethought has such aggravating results as in that of the electrical contractor. It is too often easy to suggest improvements to an existing installation. It requires much greater skill and experience to produce a design which does not need to be improved at a later date, but which nevertheless permits of extensions where they may be desirable. We deal with problems before and not after."

The mark of the National Register of Electrical Installation Contractors appears in a prominent position on the front cover, while the back cover contains in facsimile handwriting the suggestion "that you slip this behind your fuse board for future reference." This is a clever touch, especially as it is followed by the firm's name and telephone number.

From a recent study of newspaper advertising conducted by electrical contractors and electricity supply authorities it is apparent that a large proportion of these announcements lose most of their potential effect because they are not properly balanced. The copy may be good, and the type and illustrations may not in themselves offend the most fastidious eye. But a disregard of the fundamentals of good balance often produces an effect quite the reverse of what was intended. Many people have an instinctive sense of balance, but those who find it missing when they come to the planning of advertisements—and many must surely experience this loss—should cultivate the necessary sense by concentrating for a time on planning advertisements which are exactly balanced. This arrangement, though lacking variety, is neat, and does not offend the eye.

There are, theoretically, three essential points of balance, i.e., top, centre and bottom, the centre being the most usual. In preparing a centre-balanced announcement the advertiser has to guard against making the layout top or bottom heavy. Then, with the top balance, one has to aim for an effect comparable with that of a hanging curtain ; allowing considerably more white space at the bottom than at the top tends to heighten the illusion of suspension. By transferring the "white" to the top of the announcement, the right atmosphere for the bottom balance layout is created and the text rests firmly, like a building on the base line.

In an exactly balanced advertisement every component part—illustrations, boxed-in portions of the copy, type masses and white space—has its exact opposite, but in practice the monotony of such an arrangement is apt to pall ; in any event it restricts the display possibilities of many promising announcements.

Numerous ways of obtaining good, but not exact balance will suggest themselves to the advertiser. Illustrations can, for instance, be balanced by boxed-in pieces of copy, and components can be set off against others differing from them in detail or character, so long as the "weight" of the contrasted elements is the same or similar. Attention to details of this kind will soon help to make advertisements which are not only right, but look right.

When a busy electrical contractor has to plan and write his own advertisements and keep pace with a busy season, there is some excuse, though not much, for commonplace advertisements. But during the past two months or so there has not been that excuse. The electrical contractors who stopped advertising during that time did so because in their own words "trade was slack," or "it was the slack season."

Leaving aside the obvious rejoinder that advertising is more than ever necessary in a slack period, it is surely not unreasonable to expect that a small portion of this interval should be devoted to the planning of really effective advertisements for use when the busy season begins. Judging by what has appeared in the newspapers so far, this idea has not appealed to many retail advertisers of electrical goods. It is easy to say what should be done—by someone else—but when it is realised that advertising space costs just as much when it is filled with full, stodgy material that sells nothing, as it does when packed with interesting and sales-promoting copy, the little extra effort needed is really a very small price to pay.

A very pleasing performance of the modern farce, "The Whole Town's Talking," by John Emerson and Anita Loos (the famous authoress of "Gentlemen Prefer Blondes") was given by the M.-V. Dramatic and Operatic Society in the Club Theatre on October 9th. The acting was first rate and the audience very appreciative. The performance was repeated on the three succeeding evenings with equal success.

HOME LIGHTING.

Opportunities for Contractors in £1 000 Competition.

BRIEF details have already been given in these columns of the £1 000 competition for British architects, decorative artists and electrical contractors which is being organised by the "Daily Mail" in conjunction with the General Electric Co., Ltd., and it has been explained that its objects are: (1) To produce and further the use of the most modern ideas in connection with artistic electric lighting and heating in the home; (2) to demonstrate the important part which lighting plays in the home and to show its true relationship to architecture and decoration, and to encourage the development of artistic utility in the presentation of electric lighting and heating; and (3) to encourage the use of British ideas and British manufacturers.

According to fuller particulars just received, the General Electric Co. will erect at the forthcoming Ideal Home Exhibition a "Pavilion of Light," including six rooms, the lighting, heating, decorating, furnishing and electrical equipment of which will be the basis of the competition.

When the results of the competition have been decided by the assessors they will be incorporated in the "Pavilion of Light," in which each room will be erected, equipped, furnished and decorated in accordance with the winning designs.

The rooms to be included in the "Pavilion of Light" will be a lounge, dining room, bedroom, nursery, kitchen and bathroom. A plan has been prepared showing definite sizes for the respective rooms, which must be adhered to. Competitors may employ any treatment desired for the walls, floors and ceilings, and doors and windows may be placed to suit the competitor's scheme. The maximum height available in all rooms is 12 ft., but rooms need not necessarily be as high as this.

Subjects of Competition.

The lounge, dining room, bedroom and nursery are the subjects of the competition for architects alone, or artists collaborating with architects, a special section of the competition is open to artists and art students competing alone, and the kitchen and bathroom will be open to competition among electrical contractors. The assessors for all sections of the competition (which has the approval of the President of the Royal Institute of British Architects) will be:—Sir Edwin Lutyens, Sir Duncan Watson, Mr. Philip Connard, Mr. Oliver P. Bernard, Mr. Douglas G. Tanner, and Mr. Grey G. Wornum. The prizes will be distributed as follows:

ARCHITECTS AND COLLABORATING ARTISTS: For each of the four rooms in the Architects' and Artists' section, viz.: Lounge, dining room, bedroom and nursery, a first prize of 100 guineas will be awarded. For each room a second prize of 25 guineas will be awarded. For each a third prize of 20 guineas will be awarded.

ELECTRICAL CONTRACTORS: For each of the two rooms in the Electrical Contractors' Section, viz.: Kitchen and bathroom. A first prize of 50 guineas will be awarded for each room, and 10 consolation prizes of 10 guineas will be awarded for the next best schemes.

ARTISTS AND ART STUDENTS: There will also be 10 prizes of 10 guineas each, open for competition among artists and art students, for the best designs of electric light fittings for the home, in the form of: Electroliers, standard lamps, brackets or other lighting devices. And 10 prizes of 5 guineas each will be awarded to the best period designs of electric light fittings suitable for the home. Artists and art students may enter without collaborating with an architect.

The conditions of the competition provide that competing electrical contractors must submit a schedule of the electrical appliances which it is proposed to instal, and a plan showing the wiring system, together with a complete specification.

Drawings are to be made on one sheet of unmounted paper (22 in. by 30 in.) per room, the larger way of the paper to be horizontal.

The copyright of winning designs will become the property of the General Electric Co., Ltd., but the copyright of unsuccessful designs will remain the property of the competitor.

Any questions must be addressed to "Electrical Competition," "Daily Mail," Carmelite House, London, E.C.4, and must reach that address on or before October 26th. These questions will not be answered individually, but the answers will be circulated to competitors who apply for them.

The closing date for the receipt of entries is December 14th.

OVERSEAS TRADE.

Nine Months' Electrical Exports Exceed Imports by Nearly 8½ Million Pounds.

EXPORTS of electrical machinery, apparatus and material from the United Kingdom during September last amounted to £1 330 540, or £148 038 less than for the same month of 1928. Electrical exports for the nine months of 1929 amounted to £14 070 198, as against a total of £13 703 466 for the same period last year, the increase being £366 732. Imports of electrical goods during September, 1929, amounted to £782 931, as compared with £479 318 for the same month last year, representing an increase of £303 613. Similar imports for the nine months of this year amounted to £5 583 291, as against £4 506 311 for the corresponding period last year, the increase being £1 076 980.

These figures show that September exports were £547 609 in excess of imports for the same month, while for the nine months of this year the excess of exports over imports was £8 486 907.

Export items which showed improvement during September last, when compared with the same month of 1928, were, among others, motors and generators other than railway and tramway motors, increase, £34 653; various other motors, increase, £9 980; rubber insulated wires and cables, other than telephone and telegraph, increase, £52 780; and telegraph and telephone wires and cables, other than submarine, £20 337.

Imported items which were responsible for the increase in the figures for the month included, electrical machinery, increase, £40 218; and telegraph and telephone instruments, excluding wireless valves, increase, £146 497.

The following are detailed figures:—

	Month of September,		Nine Months,

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

Cooker Hotplates.

[To the Editor.]

Sir,—I think you will agree with me when I say that the boiling plates of the modern electric cooker are not so efficient as the corresponding portion of a gas cooker, although the oven is infinitely superior, and that it is this fact that causes so many prospective users finally to decide against the electric cooker.

I realise that immense strides have recently been made in boiling plate design, but still we are a long way behind.. In view of this I think that if someone were to turn his attention to the utensil this gap might be partially or wholly bridged.

During my travels I have seen many instances of totally unsuitable utensils in use, such as kettles and stewpans with warped or curved bottoms, and particularly, utensils that did not totally cover the boiling plate, thus allowing a very large percentage of heat to be wasted.

I consider that if manufacturers or suppliers of electric cookers would also supply 100% efficient utensils, a lot of the present prejudice against electric cookers would be overcome. —I am, etc.,

J. D. McRae.

54, Clifford Gardens,
London, N.W.10.
October 9th.

[While we do not agree with our correspondent on several points, we think that greater attention to the types of boiling utensils for use with electric cookers would be a useful aid to development.—Ed.]

Trade with Argentina.

[To the Editor.]

Sir,—Lord D'Abernon's trade mission to this country has been the greatest success of recent times. Apart from practical results achieved (orders for £8 000 000 from the Argentine Government) British "stock" or optimism has gone up, which if maintained is worth many more millions.

As one who has had long practical experience abroad, I should like to call attention to the absolute necessity of home manufacturers only supplying the very best goods to Argentina. Too often slackness is noticeable, and, if the antiquated idea that anything is good enough for a new country still persists, the eventual results of these contracts will negative Lord D'Abernon's efforts. This country is accustomed to selecting the handiest and most efficient material the world produces.

The Americans who have taken over the British telephones here are giving universal satisfaction (also in Chile) by installing only the pick of the world's manufactures, be they Swedish, American, or British; and not what they want to get rid of, or what is "good enough."

Even the staunchest of "Buy British" advocates out here have to admit nowadays that "Made in U.S.A." is more often a guarantee of efficiency than "Made in England."

Moreover, among what might be termed the "Smart Set," anything pertaining to Britain is treated with derision and anything Yankee "worshipped" (almost). The old-fashioned Briton who bought only British goods seems to be disappearing.

However, the average Argentine will buy British every time, if given a fair deal; sentiment is definitely in our favour.—I am, etc.,

"Mend."

Mendoza, Argentina.
September 12th.

"Where *Is* That Battery?"

[To the Editor.]

Sir,—As one who has endeavoured to improve the design and construction, and mileage of the electric road vehicle during the past 30 years, I am interested in the letters which have been appearing lately in your valuable journal concerning the merits of various storage batteries. It certainly would appear that the merits of the steel type cell warrant further attention. It is now 21 years since Mr. Edison first enlightened the world as to his investigations, and he has unquestionably evolved the most satisfactory type of battery on the market to-day. As time rolls on, however, one still sees the old-fashioned type motors and control-gear in use, and no serious attempt is made to improve the operating efficiency.

In a system which I have developed, however, a departure has been made from the orthodox, in the way of infinitely variable vehicle speed, and up-to-date regenerative control, and by its use a substantial reduction in storage battery capacity has been brought about, per given ton-mileage of transportation duty performed.

I think that it is a great pity, when there are such big potential opportunities, that some real attempt is not made to reduce the price of the storage section of this gradually improving industry, as I feel sure that the manufacturers would reap a great reward in consequence of the larger demand which would arise from their well made and reliable apparatus.

For short-haul work there is, of course, no more economical vehicle than the "pure" electric, but, for both short-haul and long distance work, there is nothing I have seen so useful, and independent, as the thermo-electric vehicle, because of its embodiment of both the thermal efficiency of high-class internal-combustion of fuel, and the variable speed, regenerative operation of the variable voltage control system of vehicle propulsion. The coming heavy road vehicle in my opinion must burn the cheap heavy fuel oil, and I think it will be acknowledged that my system, in which the storage of energy as a fundamental feature, is at least a contribution to the proper solution of this great transportation problem.

A thorough investigation of the possibilities of electric road traction in this country is very much overdue.—I am, etc.,

William P. Durtnall.

23, Bessborough Street,
London, S.W.1.
October 8th.

INCREASED GENERATION.

Commissioners' Returns Show Increase of Nearly 10% in Generation.

If evidence were needed of the steady development that is being made in the use of electricity in this country it is clearly visible in the latest analyses and summaries of the returns of fuel consumption and units generated by authorised undertakings during the year ended March 31st last. These returns, which have been issued by the Electricity Commission (H.M. Stationery Office, 1s. 6d. net) show a further increase in generation of 9·58 per cent. on the figures of 1928, the total in units being 10 878 980 925. Compared with recent years annual increases in the neighbourhood of 1 000 000 000 units are not very spectacular, but it must be remembered that the phenomenal percentage increases recorded in the years immediately following the war were largely arrears and the number of existing consumers was relatively small. A better idea of the progress made since that time is gained by contrasting the 1928-29 figure with the figure of just over 3 500 000 000 units which represented the total sales to consumers in 1922. It is notable that the increased production in the year under review was achieved with the small extra fuel consumption of 3·66 per cent. The returns cover 564 generating stations, a reduction of six as compared with the previous year. The difference was accounted for by the permanent closing of 27 stations before April 1st, 1928, by the putting into commission of ten new and three existing stand-by stations during the year; and by the inclusion in the return of eight other existing stations which had previously been operated on a non-statutory basis, but became part of authorised undertakings during the year.

NEWS IN BRIEF.

Cardiff Engineering Exhibition—Meetings of Electrical Women—Lighting at Piccadilly (London) Tube Station—Manchester and the Lighting of Schools—The Advertising Dramatic Society—New Electrical Showrooms.

TENDERS are invited for alterations and additions to East Ham electricity station.

The Borough Engineer of Colchester is to submit a scheme for the adaptation of premises in Oxborne Street for electricity offices and storerooms.

Manchester Education Committee has granted facilities to the electricity department to undertake a series of special lighting investigations in selected schools.

It is expected that Gravesend Electricity Department's offices and showrooms will be ready on October 23rd and the Mayor has been asked to open the premises.

Leafield (Oxfordshire) Parish Church is to have an electric light installation.

The annual Engineering Exhibition at Cardiff will be held from November 27th to December 7th.

Mr. V. W. Dale, of the E.D.A., lectured last week to the Oxford Chamber of Trade on "Selling by Electric Light." He stated that the appeal of a lighted display of an evening was especially valuable, for when the day's work was done the public would be in a more receptive frame of mind. Poor lighting cost money, good lighting made money.

A successful meeting was held by the Birmingham and Midlands Branch of The Electrical Association for Women on October 10th, at Walsall, under the presidency of the Mayor of Walsall. Mr. Francis, of the British Electrical Development Association, gave a lecture on "Modern Tendencies in Architecture, Furnishing, and Lighting Designs, and the Part Electricity Plays Therein." The slides were excellent, and they revealed the great possibilities of electricity in artistic lighting.

LOOKING BACKWARD

FIFTY years ago, according to THE ELECTRICIAN, *dated October 18th, 1879 :—*

Para rubber was quoted at 3s. 2d. per lb.

Several American railways discarded the telegraph in favour of the telephone.

Germany was using the electric light for naval and military purposes, notably for lighting up the ground in front of a besieged fortress.

* * *

TWENTY-FIVE years ago, THE ELECTRICIAN *of October 21st, 1904, reported that :—*

Mr. Desmond G. Fitzgerald, one of the founders of THE ELECTRICIAN *in 1861, had died.*

Following objections by Brentford District Council, an arbitrator decided not to permit the Postmaster-General to erect overhead telephone wires along Ealing and Hanwell Roads.

* * *

FIFTEEN years ago it was stated in THE ELECTRICIAN *dated October 16th, 1914, that :—*

British electrical exports for the nine months to September totalled £2 384 390.

* * *

TEN years ago THE ELECTRICIAN *of October 17th, 1919, stated that :—*

Mr. H. J. Cash, president of the E.C.A., was to take the chair at the E.T.B.I. annual dinner, which was revived after an interval of five years.

Metal prices showed further increases. Electrolytic copper was £121 and tin £283 15s. per ton.

The 1929-30 session at University College, University of London, opened on October 7th. Among the public lectures arranged are three by Mr. E. T. Elbourne on "Engineering Management," on November 12th, 19th and 26th, and one by Col. D. C. Cameron on "Some Administrative Difficulties of Mechanisation," on November 19th.

Large electric light standards are now replacing the smaller type of standard on the lower landings at Piccadilly Circus (London) Tube Station. Each standard gives a total of 500 c.p., against 200 c.p. given by the older type. The new standards are of bronze, and they broaden into a basin at the top, surmounted by a large reflector. The lamps are contained in the basin, and the light is thrown upwards and outwards.

The Institute of Metals has just issued its programme for the coming session. This includes over 40 meetings to be held in metallurgical centres throughout England, Scotland and Wales. The subjects dealt with are of an essentially practical character, and include papers on "Metal Melting by Electricity"; "Chromium Plating," "Electric Heat-Treatment Furnaces," and "The Effect of Some Impurities in Copper."

On October 10th a large party of London Members of the Electrical Association for Women, visited the showrooms of Messrs. Kelvinator Ltd., 29, Kingsway, London, W.C.2. The members were received by Mr. Browne, who afterwards gave an interesting lecture on "Electrical Cold that Keeps." It was evident from the questions asked that women are keenly aware of the importance of refrigeration in connection with the preservation of food.

Smethwick Education Committee has decided that their Uplands school be heated by electricity.

Bangor (co. Mayo) T.C. has decided to become a contributor to the E.D.A.

The Borough Engineer of Ilford is preparing plans for new electricity offices and central showrooms and storerooms at the junction of High Road and Clark's Road.

At the request of the Education Committee, Hull Electricity Committee has agreed to instal electric cookers at three domestic economy centres for trial purposes for three months.

The North Wales Branch of the Electrical Association for Women visited the Bangor electricity works on October 10th. In the course of an address of welcome, the Mayor, Mr. W. R. Jones, spoke of the drudgery of household duties. The E.A.W., he said, fulfilled an eminently useful purpose in suggesting ways and means by which that might be overcome. He was of opinion that electricity prices should be reduced until they were within the reach of working-class people. The members of the branch took the opportunity of visiting the Penrhyn Quarry, where they were entertained by the management.

The inaugural address of the president, Col. Sir T. F. Purves, which will be delivered on Thursday, October 24th, is to be simultaneously relayed, by means of microphones working over telephone trunk lines, to special local meetings of members of the Institution of Electrical Engineers at the Midland Institute, Birmingham, ; South Wales Institute of Engineers, Park Place, Cardiff; the Royal Technical College, Glasgow; the Hotel Metropole, Leeds; Liverpool University, Liverpool; the Engineers' Club, Manchester; Armstrong College, Newcastle-on-Tyne; the Municipal College, Portsmouth; and University College, Southampton.

The Bristol and District Branch of the Electrical Association for Women held the first meeting of the session on October 8th. Miss C. Haslett, director of the Association, said a handbook had been published by the Association dealing with electrical matters and suitable for the use of children, and there was no doubt it would be included in the syllabuses of schools in future. Mechanics was not a subject beyond the intelligence of girls.

The Advertising Dramatic Society will present "The Best People," David Grey and Avery Hopwood's famous comedy, at the New Scala Theatre, London, on Monday and Tuesday next (October 21st and 22nd), at 8.30 p.m., for the benefit of the National Advertising Benevolent Society. The prices of admission range from 10s. 6d. to 1s. 2d., and tickets can be obtained at the Box Office. Arks Publicity, 63, Lincoln's Inn Fields, W.C.2, are the business managers.

The calendar of Heriot-Watt College, Edinburgh, for the 1929-1930 session contains interesting information regarding day, evening and Saturday classes in electrical and mechanical engineering, etc. Particulars are given regarding fees, scholarships, bursaries and prizes, syllabuses of the classes, including those dealing with electrical theory and application, electric light installation, telegraphy and telephony, electrical machine design, etc., and the electrical engineering and other laboratories are described. The book contains nearly 300 pages, and its price is 1s.

PERSONAL.

MISS D. HORSBY has been appointed assistant in the Welfare Department of Siemens Brothers and Co., Ltd.

Mr. J. R. Barrett has joined the sales staff of the Horstmann Gear Co., Ltd., as representative in the Midlands.

Mr. H. H. Berry, who is a member of the Electrical Section Advisory Committee of B.I.F. See page 472.

Mr. John Mitchell Cusack, chairman of the Electricity Committee, has accepted the Mayoralty of Workington.

Guildford Town Council has appointed Mr. W. F. May, assistant mains superintendent, as mains superintendent.

Sir Felix Pole, chairman of Associated Electrical Industries, Ltd., sailed for America last week by the s.s. "Homeric."

Cheltenham Electricity Committee has appointed Miss D. Blaker of Portsmouth, as electric cooker demonstrator.

Ald. A. J. West, who has accepted the mayoralty of Taunton, is partner in the firm of Henry West and Son, electrical engineers.

Alderman H. R. Nuttall, chairman of Burnley Electricity Committee for many years, has been selected as Mayor for next year.

The marriage has been solemnised at St. Paul's Church, Colwyn Bay, of Mr. Wallace Meyrick Lywood and Miss Margaret Lord.

Mr. B. A. Martin Cooper, for six years mains superintendent at Blackburn electricity works, has been appointed chief assistant engineer at Worcester.

Mr. G. V. Stanley, who has since July, 1928, been acting tramways manager at Croydon, has been appointed as tramways manager at a salary of £600 per annum.

At the opening session of the Liverpool Engineering Society last week the presentation of a gold medal was made to Mr. H. E. Dance for his paper "Electricity Supply Contracts."

Bedford Electricity Committee recommends the appointment of Mr. W. Tait, mains engineer, Winchester, and Mr. N. Boydell, assistant mains engineer, Southport, as district engineers.

Mr. Robert Illingworth, of Cardiff, has been appointed deputy electrical engineer to Plymouth City Council, at a salary of £555 per annum, rising by annual increments of £15 to £600 per annum.

Fulham (London) Electricity Committee recommends that the designation of Mr. H. Clarke, now engineering assistant, be in future constructional engineer and that his salary be increased to £475 per annum.

Mr. W. Ibeson, charge engineer, at the Longroyd Bridge electricity works, Huddersfield, has secured a position at the Widnes Technical Institute, and the Town Council has appointed Mr. E. B. Haigh as his successor.

At the first meeting of the new session of the Institute of Transport, on Monday, Mr. A. A. Jackson, of Nottingham, received the Institute graduate silver medal for his essay on "The sphere of the railless trolley vehicle system."

Mr. R. E. Livesley, chief electrical assistant to Aylesbury Corporation, has been appointed borough electrical engineer to Newark-on-Trent T.C., in succession to Mr. A. J. Waring, at a commencing salary of £400, rising by £25 a year to £500.

Mr. R. Birkett, borough electrical engineer and manager of Southend-on-Sea Electricity Department for the past 24 years, has retired in consequence of continued ill health. The Town Council has fixed his superannuation allowance at £600 per annum.

Croydon Electricity Committee recommends that Mr. Hosking, now assistant power station superintendent, be designated engineering assistant to the borough electrical engineer, and that Mr. Hockley, the senior charge engineer, be appointed generating engineer.

Mr. C. W. Reeve, who has recently been acting as assistant to the chairman of the Associated Equipment Co., has been elected to the board and appointed managing director. In his earlier business life Mr. Reeve was for three years with the British Westinghouse Co. at Trafford Park, Manchester.

Mr. A. P. Young, manager of the Rugby works of the British Thomson-Houston Co., Ltd., read a paper on "Rationalisation of Industry," before the Rugby Engineering Society, last week, at the Benn Buildings, Rugby.

Amongst those upon whom the associateship of the Manchester College of Technology has been recently conferred are Sir Robert Hadfield and Sir Charles A. Parsons, but, unfortunately, they were both unable to attend, the former suffering from the results of an accident, and the latter also being in ill-health at the time.

Mr. Lanham, assistant chemist at the Ribble power station, Preston, son of Mr. E. H. Lanham, one of the engineering staff at Preston electricity undertaking, has been awarded the associateship of Manchester College of Technology and the second prize for his work during the advanced course of mechanical engineering.

Mr. G. A. Struthers, who has for the past 18 months been in charge of the beam station at Bodmin, has been appointed engineer in charge of the Post Office radio station at Hillmorton, Rugby. He succeeds Mr. H. Faulkner, who has been transferred to the headquarters of the Engineer-in-Chief of the G.P.O. in London.

Lord Birkenhead (chairman of the Greater London and Counties Trust, which is controlled by the Utilities Power and Light Corporation), Sir Laming Worthington-Evans, and Sir Harry McGowan, arrived at Southampton on Tuesday, after a visit to the United States, in order to examine electrical development and distribution in that country.

Although their two years' term of office as members of the Irish Free State Electricity Supply Board expired recently, Dr. Henry Kennedy, Irish Agricultural Organisation Society; Mr. P. J. Egan, Tullamore, and Mr. J. C. Foley, Cork, are continuing to hold office. The board, which was constituted on August 11th, 1927, includes, in addition to the three members above mentioned, Mr. J. J. Murphy, former Town Clerk of Dublin, who acts as chairman, and Dr. T. A. McLaughlin, formerly Irish manager of Messrs. Siemens-Schuckert, who is now managing director of the board. Mr. Murphy and Dr. McLaughlin were appointed to hold office for five years.

The results of the 1929 competition for the W. E. Highfield Shield and prizes recently held under the auspices of the Association of Supervising Electrical Engineers are now to hand as follows:—MEMBERS' SECTION—1ST PRIZE, value £5 5s., presented by British Insulated Cables, Ltd., awarded to Mr. D. J. Williams, Pontllanfraith, Mon., for his paper, "Public Lighting." 2ND PRIZE, value £3 3s., presented by Berry's Electric Co. (1928), Ltd., awarded to Mr. E. E. Gammon, London, for his paper, "Light: Dominating Influence of Window Display." 3RD PRIZE, value £2 2s., presented by Turner Bros. Asbestos Co., Ltd., awarded to Mr. G. Kirk, London, for his paper, "Advancement in the Application of Electricity." ASSOCIATES' SECTION—1ST PRIZE, value £4 4s., presented by Ferranti, Ltd., awarded to Mr. F. Anderson, Windygates, Fife, for his paper, "Control Boards for Super-power Stations." 2ND PRIZE, value £2 2s., presented by the editor of "Electricity," awarded to Mr. A. Simpson, Sunderland, for his paper, "Advantages of Interpoles on D.C. Generators." Mr. D. J. Williams, as winner of the first prize in the Members' Section, also wins the Highfield Shield, which he holds for one year. The Shield has now been won as follows:—England, three times; Scotland, twice; Ireland, once; and Wales, once. The examiners in this competition were Mr. S. B. Donkin (President), Mr. W. E. Highfield (Past President), Mr. W. Lang (Past Member Board of Control), Mr. T. H. Windibank (Past Chairman).

A NEW HOUSE ORGAN.

The latest addition to engineering literature, entitled "The Walder," comes from Alloy Welding Processes, Ltd., Ferry Lane Works, Forest Road, London, E.17. It is stated that the chief object in publishing "The Welder" is to propagate a knowledge of welding amongst those who are likely to be interested in a process which substantially reduces the cost of production on almost every industry. The first issue is now available and includes an open letter from the chairman of the company, Major James Caldwell, and a review of progress made in America in connection with the use of electric arc welding for steel constructional work on buildings.

There is also an article dealing with electric arc welding in the locomotive shop and one on arc welding in bridge construction, illustrated by photographs of work carried on at Lowicz, near Lodz, Poland. Other contents include a review of the A.W.P. Electric Arc Welding Operators' Handbook, and a comprehensive list of publications on welding.

Readers of THE ELECTRICIAN can obtain copies of "The Welder," on application to the editor, at Ferry Lane Works, Forest Road, London, E.17.

BRIGHTON EXHIBITION.

Brief Descriptions of Some of the Outstanding Exhibits at the Corn Exchange—Many Demonstrations of Varied Interest.

THE Brighton Electrical Exhibition which opened at the Corn Exchange and Dome last week concludes to-morrow, Saturday, after a very successful ten days. The exhibition is one of the best local displays we have yet seen and, we give below brief descriptions of some of the main items of interest.

BELLING AND CO., of Enfield, Middlesex, show fires fitted with the multi-parabola firebar, electric cookers, grillers, boilers, water heaters and other domestic appliances. They are issuing a very interesting free booklet containing much valuable information and many hints on electricity in the home, besides a full description of all their products.

BERRY'S ELECTRIC (1928), LTD., 85, 86, Newman Street, Oxford Street, W.1, display various types of "Magicoal" fires and particular attention is directed to the new 1929–1930 range. These incorporate a new flame effect of striking character, which is unaffected by external brilliant lights. In addition to a display of Berry McClary cookers, there are exhibited, for the first time, water heaters of the storage type, suitable for baths and lavatory basins. The heaters embody some unique features.

The BRITISH ELECTRICAL DEVELOPMENT ASSOCIATION, 15, Savoy Street, London, W.C.2, in addition to co-operating with the Brighton Corporation Electricity Department in the organisation of the exhibition, has arranged to present a series of spectacular electrical tableau demonstrations at 3.30, 5, 6.30 and 8 p.m. daily during the exhibition.

CARRON COMPANY, of Carron, Falkirk, gives a display of modern cooking equipment of various capacities and types suitable for every domestic requirement.

The CREDENDA CONDUITS CO., LTD., Oldbury, Birmingham, show in the water heating section examples of the latest types of "Creda" water heaters for wash basin or bath use. Two types are made, the ordinary "push through" pattern and another type having its own self-contained ball valve cistern. The finish, white cellulose enamel with gold and scarlet lining, is particularly smart. In the cooking section examples shown are of the popular "Creda" electric cookers, while in the general section examples of fires, kettles, irons and many other domestic appliances are staged.

DRAKE AND GORHAM WHOLESALE, LTD., 67, Long Acre, W.C.2, feature "Inventum" hot water cisterns in sizes ranging from 1½ gallons capacity up to 55 gallons. The 1½ gallon size is suitable for kitchen use, and will supply all the hot water required for a day's use, for a consumption of approximately 2½ units. The 15 gallon size is suitable for bath use and will give two baths, each of 22 gallons at 100 deg. F. The "Barber's" cistern is a complete hairdresser's equipment mounted on a polished back board, complete with piping, shampoo spray and mixing tap to give any desired water temperature. "Inventum" fires, "Two-Twelve" and semi-automatic boilers, refrigerators, "Rotarex" gyrator washers, etc., are other exhibits.

The EDISON SWAN ELECTRIC CO., LTD., 123–5, Queen Victoria Street, E.C.4, show, in addition to a range of kettles, fires, and other household appliances, representative examples of B.T.H. refrigerators for domestic use, the "Thor" No. 1 washer, complete with wringing and ironing attachments, the "Thor" ironing machines, while, in addition, demonstrations are given daily,

The E.L.M.A. Stand.

The stand of the ELECTRIC LAMP MANUFACTURERS' ASSOCIATION OF GREAT BRITAIN, LTD., Lighting Service Bureau, 15, Savoy Street, London, W.C.2, is intended to demonstrate very forcibly the difference between good and bad lighting. The background of the exhibit comprises a display of lamps ranging from 15–1 000 W. A particular feature of this display is the introduction of glareless pearl and opal lamps to the exclusion of all clear lamps of the 100 W size and under. The side panels contain small models of interiors of rooms which provide a fascinating realism by virtue of the exactness of their detail. The exhibit tells its own story by means of flashing opal signs above and below each model, which change simultaneously with the lighting of the interior indicating the new and old ways of lighting.

ELECTRIC FIRES, LTD., Norwich, exhibit electric heating apparatus, including an electric water heater giving a continuous and abundant supply of hot water. Several different patterns are shown, each having its own particular application. For instance, there is a "Heatrae" F.B. type tank which is shown working in conjunction with a bath and lavatory basin, provision also being made for a supply to the kitchen. There is also an example of a tank of the R.T.B. type, which is suitable for direct connection to the water supply without the intervention of a ball valve cistern. This tank is suitable for supplying hot water to one point only. There is another example which shows a R.T.A. pattern, complete on stand and arranged so that those interested can readily inspect all the working parts. There is a demonstration model of a "Heatrae" wash boiler. This has a glass top so that the action of the spraying device can be seen under actual working conditions.

An Electric Geyser.

A 4 kW size nickel plated geyser is shown with interlocked handle and water valve. This is intended for giving small intermittent supplies of hot water, such as would be required by dentists, doctors, etc. Immersion heaters are shown in large variety, while another useful demonstration is given of an immersion heater fitted into the top of a tank, part of which is cut away, and shows the action of the immersion heater. There is another tank demonstrating the method of fitting an immersion heater and automatic temperature regulator.

ELECTROLUX, LTD., 153–155, Regent Street, London, W.1, make a special show of their already well-known cleaners, refrigerators, water softeners, and floor polishers.

Messrs. E. E. FELLINGHAM, 116, North Street, Brighton. This local firm is exhibiting in the Water Heating Section (Corn Exchange) a range of "Margo" water heaters which have now incorporated many interesting improvements, while, in the Dome, is made an excellent display of modern lighting fittings and other electrical appliances, including electric fires, tubular heaters, etc. Special demonstrations are given with the "Hotpoint Premier Junior" vacuum cleaner.

FERRANTI, LTD., Hollinwood, Lancs., specialise in showing the advantage of water heating and point out that there are now many places in Great Britain where a correctly designed and well installed electric water heating equipment affords to the average householder the cheapest means of obtaining his hot water service without even making allowance for the very considerable saving in the cost of labour which is entirely eliminated. Radiant heat is dealt with in the exhibit of Ferranti fires.

Messrs. H. J. GALLIERS, 32, St. James's Street, Brighton, point out that in electrical matters, there is always something new to be learned; and the three stands of the House of Galliers provide a liberal education in the latest applications of electricity to domestic work, wireless, motoring, and particularly to hygiene. Exhibits include a special display of "Litlux," the new non-glare bedlight, a demonstration of "Thermega" electric blankets and pads, "Cosmos" domestic appliances, including the new automatic safety electric kettle, "Magnet" electric household appliances, including the "Minor" cooker and "Magnet" sewing machine motor, "Creda" hot water systems and cookers, the new "Magicoal" electric fires, the "Magnet" electric vacuum cleaner, and the electric floor polisher, "Orion" electric washers, new model electric fires, the "Crypto" battery charger, "Exide" batteries for wireless, radio gramophones, all-electric and portable wireless, the new "Amplion 1930" loud speakers, "Gallia" fittings and wall brackets, and "Kelvinator" refrigerators.

The GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, London, W.C.2, shows, in the Dome, household appliances and an exceptionally fine and comprehensive display of lighting fittings. The appliances include a range of fires of entirely new design, amongst which may be particularly noted a reflector fire of 1½ kW loading. In the Corn Exchange Building are exhibited domestic and industrial cooking apparatus of all types. "Magnet" electric water heaters are demonstrated, while visitors to the exhibition have an unique opportunity of judging the comparative excellence of meals cooked entirely by electricity, the Corporation having installed in co-operation with the G.E.C. an electric kitchen equipment which is employed in the preparation of all meals served in the restaurant. The G.E.C. equipment includes the following apparatus:

DOMESTIC ELECTRICAL APPLIANCES.

Gramophone Company Enters Radio Field—A New L.F. Coupling Device—A Further Lamp Campaign.

ON October 10th a demonstration of the "His Master's Voice" radio-gramophone was given by Captain P. P. Eckersley. The demonstration took place at the Oxford Street branch of THE GRAMOPHONE CO., LTD. (363, Oxford Street, London, W.1) and the firm's head office is at Hayes, Middlesex. In his remarks introducing the instrument, which marks the début of H.M.V. in the radio field, Captain Eckersley said that his firm was concentrating on a radio-gramophone which would give perfect reception of certain stations rather than on a set which would reach out all over Europe in search of howls and squeaks. That is to say, while the H.M.V. radio will obtain a good deal more than the local programmes, the Gramophone Co. considers simple reception and good reproduction the prime essential.

The H.M.V. radio-gramophone, model 520, is a handsome piece of apparatus, the lines chosen for the cabinet being extremely graceful. Inlay and "cross-grain" combine to give a striking effect of perfect finish. The dimensions of the cabinet are: height 41½ in., width 19 in., depth 20¾ in.; it can be had in oak, walnut, or mahogany. On the gramophone side the instrument is equipped with "His Master's Voice" electrical soundbox No. 7A, and a new type of induction disc turntable motor. An H.M.V. automatic brake stops the motor at the end of each record. On the radio side the chief point of interest appears to be the simplicity of control, which makes it unnecessary for the ordinary user of the set to touch more than one knob in any circumstances; for those who insist on trying their hands at distance reception an edge-control for adjusting the aerial coupling and a reaction coupling are provided. The aerial is normally rather more loosely coupled than has been usual. The set is not self-contained where the aerial is concerned. A.C. all-mains drive is employed.

The built-in loud speaker is of the latest H.M.V. moving-coil type, and special attention has been paid to avoiding harshness at the middle frequencies. Several records were played at the demonstration, and in spite of the relatively small size of the reception room, the reproduction was undoubtedly remarkable, even to one familiar with the high quality yielded by electrically recorded music when played by an electrical gramophone. As the demonstration was held at 6 p.m., radio reception consisted chiefly of the news bulletin and market prices for farmers from 5GB without any trace of London coming in, a good test of selectivity in view of 2LO being just across the road.

The new poster in connection with the lamp campaign of the Edison Swan Electric Co., Ltd.

While dealing with the subject of domestic electrical appliances, mention should be made of the fact that the EDISON SWAN ELECTRIC CO., LTD., of 123, Queen Victoria Street, London, E.C., has now launched its lamp sales campaign. In this connection a varied and attractive series of counter folders, leaflets, showcards, etc., has been prepared, together with comprehensive catalogues of domestic, motor car, coloured spray lamps and Christmas tree sets. Arrangements have been made for displaying the "Ediswan" poster in nearly 300 districts throughout the country, and the campaign is already beginning to play its part in increasing sales.

The "C.A.C." low frequency coupler is stated to be one of the best methods of l.f. amplification for uniformity at all audible frequencies. It is marketed by GRAMO-RADIO AMPLIFIERS, LTD., 1A, New London Street, London, E.C.3. The coupling unit has no rising or falling characteristic and we understand that a flat response from 30 to 10 000 cycles is assured. The external field is stated to be almost negligible, owing to the small winding diameter, and to the high damping of the wire. While special valves are not required, moderately high voltages are desirable.

The latest product of the Gramophone Co., Ltd.

The substantial and convenient terminals of the coupler are arranged so that it can be wired into a set in a few minutes. It is only necessary to connect the plate of the preceding valve to the terminal on the coupler marked "A." The remaining terminals are connected direct to the batteries and loud speaker. The coupler should commend itself to makers of portable sets: a complete 3-stage coupler weighs 10 oz., and the overall dimensions are 5$\frac{9}{16}$ in. by 4$\frac{3}{16}$ in. by 1$\frac{3}{4}$ in. high. It is stated to be particularly suitable for use with a pentode valve in the last stage. It is also recommended for amplification from gramophone pick-ups, the arrangement of the windings resulting in effective scratch-filtering.

A new type of junction box for use with the "Magnet" wiring system has just been introduced by THE GENERAL ELECTRIC CO., LTD., of Magnet House, Kingsway, London, W.C.2. It is moulded from G.E.C. "Wittonite" composition and fitted with bakelite moulded terminal heads. This construction is claimed to be suitable both for tropical situations, where insects and condensation have to be contended with, and for home requirements. Either "Magnet" bond lead covered or C.T.S. (tough rubber) cables may be used with the box, which is circular in shape with a smooth "Wittonite" cover having a centrally situated recessed thread for screwing to the base. The centre screw of the base is slotted, and carries a milled nut so that a bonding wire can be rigidly gripped. There are also four slotted wiring terminals, the terminals being fitted with bakelite moulded heads to avoid live points being exposed in the event of the cover being removed and not replaced. Eight inlets are provided so that eight twin cables up to 3/.036 S.W.G. can be accommodated after removing the guarding webs. Round the top of the base is a channel to take a plastic sealing compound, for use when it is considered advisable to seal the box.

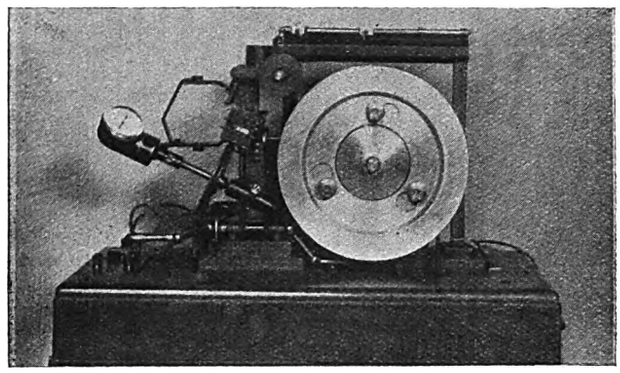
SOUND RECORDING.

The Blattner System of Electro-Magnetic Recording and Reproduction.

A SYSTEM of making and reproducing sound records, which seems to be destined to supersede the old system employing discs or cylinders, was demonstrated last week to pressmen and others, by Mr. Louis Blattner, at the Blattner Colour and Sound Studios, at Elstree. The nucleus of the new system, which is now ready for commercial exploitation, was discovered some forty years ago; Dr. Kurt Stille began to work



A close-up of the new recording apparatus.

upon it 25 years ago, and the Ludwig Blattner Picture Corporation, of London, and the Telegraphie Patent Syndikat, of Berlin, have recently conducted laboratory and studio work which has resulted in bringing the system to a stage which indicates that the invention will probably revolutionise present-day practice.

The process is as follows. The sound waves are impressed on to a microphone, which converts the acoustic vibrations into electrical vibrations, and these are conducted into the coils of electro-magnets. Past the cores of these electro-magnets a thin steel tape or wire is made to move at a constant speed. The electrical vibrations are recorded and fixed as magnetic vibrations on the tape or wire. Reproduction is effected by the reverse process. The different magnetic values of the steel tape or wire influence the small cores of the electro-magnets, giving rise to current impulses, which are made to influence a loud speaker or telephone diaphragm, and are thus converted into sound.

This method obviously effects economy of space and increases portability, in comparison with discs and cylinders, and enables records to be of almost unlimited lengths. Records giving three hours' continuous reproduction have already been used. Another advantage of these steel records is that they can be reproduced an infinite number of times.

The items in the demonstration referred to included a reproduction of a monologue recited by Mr. Henry Ainley, whose enunciation was faithfully reproduced, and a "talkie" picture of Miss Ivy St. Helier, who sang, to her own piano accompaniment, and concluded her performance with an amusing talk. This picture was very realistic, and the sound record was distinct and well synchronised.

The most intriguing application of the invention demonstrated, however, was its use as a recorder of telephone conversations. A conversation through the Post Office exchange system was recorded, and afterwards heard, completely and clearly, through the hand-set attached to the instrument.

Records can be repeated in this manner immediately after the short interval necessitated by the running back of the wire.

Performances of instrumental music were also given in the studio, and the advantages afforded by the ability of the apparatus to give an accurate and immediate play-back were again realised.

Many uses of the recording telephone will readily suggest themselves, such as its utility as a dictating machine, a recorder of messages in the subscriber's absence, a "file" of conversations for use as evidence, and the teaching of languages and scientific and other lessons in schools.

It is stated that research work in progress at the Stille Laboratories, Berlin, includes the electro-magnetic fixing and reproducing of optical signs on steel tape as a substitute for television.

The commercial control of the undertaking is in the hands of the Ludwig Blattner Picture Corporation, Ltd., 35 and 36, Little Newport Street, London, W.

BRITISH INDUSTRIES FAIR.

Advisory Committee for the Electrical Section—Work of the E.D.A.

THE Advisory Committee for the Electrical Section of the 1930 British Industries Fair will consist of Lt.-Col. K. Edgcumbe, Messrs. F. Anslow, E. G. Batt, A. G. Beaver, H. H. Berry, J. K. Brydges, D. N. Dunlop, H. Willoughby Ellis, Dr. S. Z. de Ferranti, Lt.-Col. W. J. Kent, Messrs. T. R. Martin, Dr. A. H. Railing, Messrs. C. W. Sully, J. Wilson, Lt.-Col. W. A. Vignoles, Messrs. V. Watlington, and E. J. Jennings. See pages 468 and 477.

At a meeting of the Committee on October 1st, Mr. T. R. Martin was elected chairman and Mr. H. H. Berry vice-chairman. Mr. Jennings was pressed to continue as honorary secretary, on the understanding that the E.D.A. would assist in the work incidental to the organisation of the Electrical Section of the Fair. The E.D.A. is taking a prominent part at the next Fair, and is erecting a kiosk in the centre of the Section, which will be an outstanding feature, and the design of which is now under consideration. The E.D.A. will also issue a more complete separate guide to the Electrical Section, as well as a railway and road service time-table, for the convenience of the visitors to the Fair. The question of a distinctive colour scheme for the Electrical Section is being actively pursued, and it is hoped that the co-operation of exhibitors will be secured, in order to make this a feature of the show.

The lay-out of the whole of the buildings will be considerably improved, wider gangways being allowed for, and these will be in alignment from one end of the building to the other. The electrical exhibitors at this year's Fair have re-booked for 1930 to the extent of 95%, and a number of new exhibitors are coming in.

The work of the Advisory Committee will be continued between now and February next by a small Executive Committee, consisting of Messrs. Martin, Berry, Railing, Vignoles and Jennings.

THE SOCIAL SIDE.

THE 26th A.A. Battalion, R.E. (London Electrical Engineers), has acquired a football ground at Wembley, in Preston Road, and has joined the Chiswick and District League. The fixture list and full details showing routes to the battalion ground will be posted on Mess notice boards. It is hoped that all members of the unit will support the team at as many matches as possible. There are still vacancies for playing members, and names should be given to Sergt. F. Welton or to company representatives. The battalion meets Christchurch Greyfriars in the 3rd round of the Amateur Junior Cup L.F.A. on October 26th at Edgware. During November battalion H.Q. messes and billiard room will be open on Wednesday evenings from 7.30 to 10.30 pm. The Recreations Committee hopes to arrange a billiard tournament and similar competitions on these evenings. Full particulars will be published on Mess notice boards. If the attendance during November warrants it, "Club" nights will be continued throughout the winter. Full particulars of dances will be available on Bounty night. If the Mess dances arranged for November are well supported, it is hoped to arrange for others to follow.

The General Electric Co., Ltd., held a swimming gala under the auspices of the Magnet Social Club recently at the Holborn Baths. The two main events were competitions between various G.E.C. London establishments for cups presented for team events by Mr. and Mrs. L. C. Gamage. Mrs. Gamage's cup was won by the G.E.C. Research Laboratories, who beat Magnet House, and the L.C. Gamage cup was won by Fraser and Chalmers, Erith.

ELECTRICITY IN COLLIERIES.

In a lecture to the students at the Glamorgan County Council Summer Mining Engineering and Social Science School, at University College, Swansea, recently, Major E. Ivor David said any scheme which would increase the sale of saleable coal at the expense of unsaleable coal was worthy of consideration. He dealt with all aspects of the generation and distribution of electricity in mines and showed lantern slides of colliery power stations. He said the production of electricity had expanded until, at the present time, the production of energy at collieries constituted one of the greatest industrial activities in the whole of the country.

CONTRACTORS' YEAR BOOK

A Record of the Progress of the Electrical Contractors' Association.

THE "Electrical Contractors' Year Book" for 1929-30 has just been issued by the Electrical Contractors' Association, 15, Savoy Street, Victoria Embankment, London, W.C.2, price 5s. The book shows a considerable increase in bulk compared with its predecessors, and it now extends to 500 pages. It contains geographical and alphabetical lists of the Council, officers and members of the Electrical Contractors' Association, the N.E.C.T.A., Ltd., and the National Federated Electrical Association, an indication being given of those who are on the National Register of Electrical Installation Contractors.

Amongst other interesting contents are the annual report, which was submitted at the annual meeting of the E.C.A. and Allied Associations at Bournemouth in June last; Mr. W. H. Walton's presidential address; information as to qualifications for membership, entrance fees and subscriptions; a useful guide to architects and the public regarding wiring specifications; E.C.A. conditions of tender and contract for electrical work; the recommendations of the special committee appointed to formulate a trading policy to be followed by the N.E.C.T.A., Ltd.; a summary of the law for electrical contractors; information relating to the Electrical Trades' Benevolent Institution, the National Register of Electrical Installation Contractors, the British Electrical Development Association and the British Engineering Standards Association; a list of central stations of the United Kingdom, giving the names of the chief or resident engineers, the voltages and systems of supply; details regarding the National Joint Industrial Council and District Joint Councils for the Electrical Contracting Industry; the National Standardised Wages Agreements; the working agreement with the N.A.S.E.E.; working rules for various districts; a copious classified index to advertisers, etc. The volume is of handy size, and is well printed and neatly bound.

THE NATIONAL REGISTER.

Further Additions to the List of Registered Contractors.

AT a meeting of the National Register of Electrical Installation Contractors on October 4th, the Executive Committee considered ten applications from electrical installation contractors for registration, seven of which were accepted and three were declined.

The names of the successful applicants, together with their addresses, are given below:—

Ryder, C. B., and Co., Ltd., High Street, Heathfield, Sussex.

Heptonstall and Connell, Somerset Hotel Yard, Parliament Street, Harrogate.

Trojan Electrical Co., 12, Alexandra Road, Manchester.

Hall, Thomas J., 74, Malden Road, Cheam, Surrey.

Dunn, Wm. B., Front Street, Bedlington, Northumberland.

House, Alec W., 19, Blake Street, York.

Brewer and Phillips, 66, Regent Street, Plymouth.

ELECTRIC TRACTION.

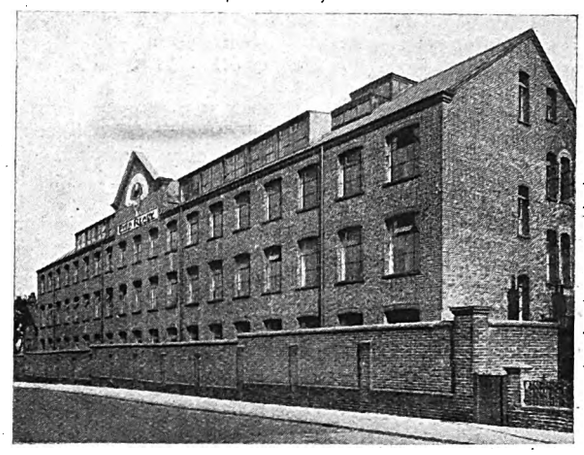
Scheme for Completing Electrified Line Between London and Brighton.

THE Southern Railway Co. has decided to extend the d.c. third-rail system from London to Brighton and Worthing. It is hoped to complete the scheme in two or three years. This will be the first main line to be completely equipped for electric traction. Work on the scheme will be begun during the next two or three months. Of the main line from London to Brighton the fourteen miles to Purley are already electrified, and the new scheme includes the remaining 37 miles and the line from Preston Park to Hove and Worthing, a distance of 11 miles. The line from Redhill to Guildford, via Reigate and Dorking Town, a distance of 20 miles, will also be electrified. Up to the end of 1928 the Southern Railway had expended over £10 000 000 on electrification.

The Minister of Transport, on October 10th, met representatives of London County Council and the Underground Group, and the subject of improvement of traffic facilities in the London area was discussed. It was agreed that the interests concerned should bring before the Ministry schemes of extension and development.

BUSINESS ITEMS.

PHILIPS LAMPS, LTD., demonstrated the efficiency of their latest travelling broadcast van at Hull during Civic week recently, when the speech of Prince George, on the occasion of the opening of the new aerodrome, was relayed to over



A view of the factory of the Ever Ready Co. (Great Britain), Ltd., at St. Ann's Rd., Harringay, London, N.

50 000 people. In addition to the microphone used by Prince George, other microphones were scattered about the aerodrome for the use of officials. A 500 W amplifier supported by a smaller microphone-gramophone amplifier was used, and the plate voltage of 4 000 V used by the former was derived from current generated on board the van. In the evening "Philips" received a call to the Hull Guildhall, where amplification of important speeches delivered at the University College of Hull Banquet was required. In a short time an amplifying system was installed in the Guildhall, so that every guest was able to follow the speeches in comfort. The day previous a duplicate installation was placed in the City Hall for the relaying of the R.A.F. Band to the Hull Old Art Gallery.

A system of auxiliary turbo-electric drive for vessels with steam-reciprocating engines has recently been installed in the Ellerman Liner, "City of Hong Kong." The system has been developed by the METROPOLITAN-VICKERS ELECTRICAL CO., LTD. in co-operation with Mr. Hinchcliffe, superintendent engineer of Ellerman Lines, Ltd., and the alterations to the vessel have been carried out by WORKMAN CLARK (1928), LTD., of Belfast. This is claimed to be the first application of auxiliary turbo-electric drive to ship propulsion. Trials were carried out in the Irish Sea, on October 10th and 11th, and an exhaustive investigation of the performance of the machinery over a wide range of operating conditions was made. Included amongst the tests were a series of full speed and slow speed reversals of the reciprocating engine and electrical machinery together. The simplicity with which the control of this new system is carried out received particularly favourable comment.

A paragraph recently appeared in the daily press commenting on the opening from Sevilla by General Primo de Rivera of the new Spanish-Argentine radio link. This new service, which will connect the Spanish telephone system through the International Telephone and Telegraph Corporation's network in Sevilla to the Argentine, Uruguay and Chili, marks a further advance in radio telephony, in that complete privacy is claimed for it. Overhearing by unauthorised listeners is stated to be no longer possible, as the waves are transmitted in a distorted form so as to be unintelligible to the ordinary radio receiving station. Except for the one working between Great Britain and the United States, this radio telephone link of 9 600 kms. (the longest of its type yet in existence) is the only one that is connected with the ordinary public telephone systems at both ends, permitting distant subscribers to converse from their ordinary telephones without either of them having to go to a central station cabin. It is interesting to note that the subfluvial cable under the River Plata connecting the Argentine and Uruguayan telephone systems, and the transmitting and receiving stations for this new link, were supplied by STANDARD TELEPHONES AND CABLES, LTD., and manufactured at Woolwich and Hendon.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, where available.

INVERNESS COUNTY EDUCATION AUTHORITY.—Electric lighting work of new school at Inverlochy, near Fort William. Schedules, etc., from the Master of Works Office, 11, High Street, Inverness.

BELFAST CORPORATION, October 21st.—Supply of circulating water pipes, for the electricity department. Specification (W.97) from Mr. F. H. Whysall, city electrical engineer and general manager, East Bridge Street, Belfast; deposit, £2 2s.

BELFAST CORPORATION, October 21st.—Manufacture and erection of h.t. armour-clad switchgear. Specification (No. W.98) from Mr. F. B. Whysall, city electrical engineer and general manager, East Bridge Street, Belfast; deposit £2 2s.

CARDIFF CORPORATION, October 21st.—Supply and erection of (1) water-tube boiler and mechanical stokers; and (2) fuel economiser. Specification, etc., from the City Electrical Engineer, Central Offices, The Hayes, Cardiff. Only contractors on the King's National Roll are invited to tender.

EASTBOURNE CORPORATION, October 21st.—Electric lighting of grammar school extension. Specification, etc., from the Borough Engineer.

GLASGOW PARISH COUNCIL AND DISTRICT BOARD OF CONTROL, October 21st.—Six months' supply of electrical fittings to the institutions and offices. Form of tender (No. 62) from Mr. M. A. Reynard, inspector and clerk, 266, George Street, Glasgow, C.1.

STAINES RURAL DISTRICT COUNCIL, October 21st.—Construction of sewers and electrical and other equipment for pumping stations. Specification, etc., from the Engineer, Council Offices, London Road, Ashford, Middlesex.

CLACKMANNAN MATERNITY AND CHILD WELFARE COMMITTEE, October 22nd.—Electrical installation in connection with additions and alterations at Alloa Day Nursery. Tenders to Mr. J. Reed, 2, Candleriggs, Alloa.

COMMISSIONERS OF HIS MAJESTY'S WORKS, ETC., October 22nd.—Steel conduits and fittings for electric wiring. Forms of tender, etc., from the Controller of Supplies, King Charles Street, Westminster, London S.W.1.

COMMISSIONERS OF HIS MAJESTY'S WORKS, ETC., October 22nd.—Supply of electric cable and wire. Forms of tender, etc., from the Controller of Supplies, H.M. Office of Works, etc., King Charles Street, Westminster, London, S.W.1.

SOUTHWARK (LONDON) BOROUGH COUNCIL, October 22nd.—Twelve months' supply of electric cables. Further particulars from the Electrical Engineer, Penrose Street, Walworth Road, London, S.E.17.

WARDLE (LANCS) INDUSTRIAL CO-OPERATIVE SOCIETY, LTD., October 22nd.—Electric light installation in shop. Particulars from the Manager.

GLASGOW EDUCATION AUTHORITY, October 23rd.—Electric lighting installation in Springburn (New) H.G. School. Specifications from the Education Offices (Property Department), 129, Bath Street, Glasgow; deposit £1 1s.

HASTINGS CORPORATION, October 23rd.—(*a*) 22 000 V, three-phase overhead lines and underground cables, Crowhurst section, No. 7 (about 7 000 yds.); (*b*) 400 V, three-phase, 4-wire, overhead lines and underground cable, Crowhurst section, No. 7 (about 4 200 yds.); (*c*) 400 V, three-phase, 4-wire, overhead lines and underground cable, Whatlington Road section, No. 8 (about 1 000 yds.). Specifications (deposit £1 1s. for each) from Mr. A. J. Ryan, borough electrical engineer.

MANCHESTER CORPORATION, October 23rd.—Supply and erection of four 33 000 V, 500 000 kVA rupturing capacity, metal-clad, compound filled switch units, etc. (specification No. 256); and two 10 000 kVA, 33 000/6 600 V, self-cooled, oil immersed, indoor type transformers (specification No. 257). Specifications from Mr. H. C. Lamb, Electricity Department, Town Hall, Manchester; deposit £1 1s. for each.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, October 25th.—One 130 ton, 4-motor, electric, engine room crane, one 15-ton 3-motor, electric, auxiliary bay crane, and one 10-ton, 3-motor, circulating pump house crane, at Ironbridge power station. Specification (No. 6) from Mr. E. F. Hethern-gton, chief engineer and manager; deposit £1 1s.

WEST RIDING EDUCATION COMMITTEE, October 28th.—Electric light installation at Whitwood Mining and Technical. Institute. Specification, etc., from the Education Officer, County Hall, Wakefield.

METROPOLITAN ASYLUMS BOARD, October 30th.—Central battery telephone system at South-Western Fever Hospital, Landor Road, Stockwell, London, S.W.9. Specification from the Board's Office, Victoria Embankment, E.C.4; deposit £1.

STAFFORDSHIRE EDUCATION COMMITTEE, October 31st.—Electric light installation in two new elementary day schools in Brettell Lane, Brierley Hill. Specification from Messrs. Moffett, Rosher and Mann, Union Chambers, Temple Row, Birmingham; deposit £5 5s.

BRADFORD CORPORATION, November 9th.—Twelve months' supply of stores to the tramways department, including electrical fittings for tramcars, insulating material, insulated bolts, copper controller contacts, etc. Schedules, etc., from Mr. R. H. Wilkinson, general manager, 11, Forster Square, Bradford.

CENTRAL ELECTRICITY BOARD, November 9th.—Supply and erection of overhead 33 000 V transmission lines in South Lincolnshire, in connection with Mid-East England scheme. Specification (No. M.E.E.—S.L.1) from Mr. R. H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, Charing Cross, London, W.C.2; deposit £2 2s.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, November 15th.—Supply and erection at Ironbridge power station of (*a*) two 6 000 kVA, 33 000/3 300 V, 50 cycle, indoor type transformers, with off-load tap changing switches; (*b*) two 1 200 kVA, 3 300/400/230 V, 50 cycle, indoor type transformers, with off-load, tap changing switches; (*c*) two 150 kVA, 3 300/400/230 V, 50 cycle, indoor type transformers, exclusive of tap-changing switches. Specification (No. 7) and form of tender from Mr. E. F. Hetherington, at the offices of the Authority, Phœnix Buildings, Dudley Road, Wolverhampton; deposit £1 1s.

EAST RETFORD CORPORATION, November 19th.—Electrically driven centrifugal borehole pump (60 000 gall. per hour). Specification from Mr. S. O. Pacey, Gas and Water Electricity Offices, East Retford; deposit £2 2s.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

ROUMANIAN GENERAL POST OFFICE, October 18th.—Supply of 31 500 kilos of 3 mm. h.d. copper wire. (Reference A.X. 8 551.)

NEW ZEALAND POSTS AND TELEGRAPHS, October 21st.—Supply of switchboard cords (P. and T. No. 151/1813). (Reference B.X. 5 715.)

WELLINGTON CORPORATION, October 21st.—High and low tension switchgear (contract No. 449). (Reference B.X. 5 649.)

NEW ZEALAND POSTS AND TELEGRAPHS, October 22nd.—Supply of 100 buzzers, with high-wound coils and approximate resistance of 20 Ω. (P. and T. No. 151/1 852.) (Reference B.X. 5 787.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, October 22nd.—Supply of insulated wire (schedule C. 475). (Reference B.X. 5 580.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, October 22nd.—Telephone transformers (schedule C. 474). (Reference B.X. 5 581.)

VICTORIAN RAILWAY COMMISSION, October 23rd.—Dry-core telephone cable (contract No. 43 384). (Reference B.X. 5 638.)

EGYPTIAN MINISTRY OF THE INTERIOR, October 28th (extension of time).—Erection and equipment of electric power station (about 500 kVA), with overhead and underground networks, for the town of Menouf. (Reference B. 5 758.)

INDIAN STORES DEPARTMENT, October 28th.—House service meters for one year (order No. N. 10 282.) (Reference B.X. 5 749.)

Digitized by Google

NEW ZEALAND POSTS AND TELEGRAPHS, October 29th.—Telephone cable (specification No. 256). (Reference B.X. 5 788.)

NEW SOUTH WALES GOVERNMENT RAILWAYS, October 29th.—Railway traction motor testing equipment, comprising electric motor, booster, main field excitation generator and short field exciter (quotation No. B.E. 508). (Reference B.X. 5 693.)

POSTMASTER-GENERAL'S DEPARTMENT, Melbourne, October 29th.—Supply of v.i.r., lead covered cable (schedule C. 510). (Reference No. 5 759.)

INDIAN STORES DEPARTMENT, November 12th.—Battery charging motor generators, transformer and oil switch, for Simla wireless station (order No. N.10 159). (Reference B.X. 5 774.)

CHILEAN STATE SUPPLY DEPARTMENT, November 14th.—Telegraph material. (Reference B.X. 5 746.)

INDIAN STORES DEPARTMENT, November 14th.—Supply and erection of crude oil engine-driven d.c. generating set, motor generator set and switchgear, for Military Engineering Services, Razmak (order Nos. N. 9 886 and 10 075). (Reference B.X. 5 744.)

INDIAN STORES DEPARTMENT, November 18th.—Supply and erection of two 20 kW oil engine driven d.c. generators, etc. (order No. N. 10 253). (Reference B.X. 5 757.)

VICTORIAN ELECTRICITY COMMISSION, November 25th.—Watt-hour meters, recording instruments and remote metering equipment, for Metropolitan terminal stations and sub-stations (specification No. 29/92.) (Reference B.X. 5 614.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, November 26th.—Vitreous resistances, each consisting of wire element wound in vitreous spool, for telegraph battery feeds (schedule C. 489). (Reference B.X. 5 696.)

VICTORIAN RAILWAY COMMISSION, November 27th.—Indication transformers for railway signalling (contract No. 43 412). (Reference B.X. 5 737.)

VICTORIAN ELECTRICITY COMMISSION, December 9th.—Supply of 3 000 kVA transformers and spares (specification No. 29/119.) (Reference B.X. 5 775.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, December 10th.—Switchboard keys and parts (schedule No. C. 496). (Reference B.X. 5 776.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, December 10th.—Electric lamps, lamp caps and sockets for telephone purposes (schedule C.497). (Reference B.X. 5 783.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, December 17th.—Secondary batteries (schedule C.505). (Reference B.X. 5 777.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 7th.—Supply of testing instruments (schedule C.504). (Reference B.X. 5 786.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 7th.—Supply of timing clocks (schedule No. C.507). (Reference B.X. 5 762.)

Tenders Accepted.

HOLBORN (LONDON) GUARDIANS.—C. E. Keates, fire alarms, at institution, £135.

WOODHOUSES CHURCH SCHOOLS.—Caton and Sons, electric light installation, £70.

EDMONTON GUARDIANS.—Edison Swan Electric Co., Ltd., supply of electric lamps.

ILFORD CORPORATION.—Crompton Parkinson, Ltd., supply of kiosks and transformers, £971 6s.

HULL CORPORATION.—A. Shaw and Sons, electric light installation at Hall Road School, £329.

SHOREDITCH (LONDON) GUARDIANS.—Metro-Vick Supplies, supply of electrical goods for six months.

BEXHILL CORPORATION.—H. W. Elsworth, electric lighting installation at Polegrove Pavilion, £19 5s.

GAINSBOROUGH URBAN DISTRICT COUNCIL.—Worthington Simpson, Ltd., electric motor and pump.

KETTERING URBAN DISTRICT COUNCIL.—Union Cable Co., Ltd., supply of h.t. armoured cable, £866.

MATTIMORE HOUSE, HOLBEACH.—W. and R. Tombling, electrical installation, £50 plus £10 for bells.

SWINDON CORPORATION.—British Thomson-Houston Co. Ltd., two h.t. switchgear cubicles, £1 604.

LEXDEN AND WINSTREE GUARDIANS.—S. Bailey and Co., wiring Children's Home for electric light, £30.

CROYDON CORPORATION.—A. E. Farr, erection of cooling tower (in place of tender withdrawn), £18 753.

OLDHAM CORPORATION.—Tudor Accumulator Co., Ltd., periodical examinations of battery at new power station.

CHESTERFIELD CORPORATION.—Macintosh Cable Co., Ltd., cables for miscellaneous extensions, £902 7s. 3d.

DUDLEY CORPORATION.—Cook and Son, electrical installation at 564 houses on Priory Estate, £2 566 4s.

"MAZDA" Pearlies. An ingenious fancy dress designed and worn by Miss Mellor, of Derby Street, Bolton.

ENNISKILLEN URBAN DISTRICT COUNCIL.—H. R. Higginbotham, electric light installation in Town Hall.

MANCHESTER EDUCATION COMMITTEE.—John Adams, Ltd., electrical installation at Aspinal Municipal School.

ANDERSON UNITED FREE CHURCH, BLANTYRE.—Johnstone, Park and Co., electric light installation in new hall.

PORTLAND URBAN DISTRICT COUNCIL.—Pirelli-General Cable Co., Ltd., laying services, at schedule prices.

BRIGHTON CORPORATION.—A. Reyrolle and Co., Ltd., supply of h.t. switchgear, £650. (Recommended.)

BURTON-ON-TRENT CORPORATION.—Pirelli, Ltd., laying cable from Tutbury to Marchington, £4 301 12s. 9d.

ESSEX COUNTY COUNCIL.—General Electric Co., Ltd., ten standards and lanterns for Black Notley sanatorium.

FALKIRK EDUCATION COMMITTEE.—J. Scott and Co., electric lighting work in new school. (Recommended.)

BEDFORD CORPORATION.—Robert M. Russell, erection of overhead lines to Ridgmont, £498, and to Lidlington, £355.

HACKNEY (LONDON) BOROUGH COUNCIL.—Electricars, Ltd., supply of seven electric vehicles for refuse collection, £605 each.

WESTMINSTER CITY COUNCIL.—Speedy and Eynon, electric light installation at Canal Buildings, £182. (Recommended.)

OLDHAM CORPORATION.—Ferguson, Pailin, Ltd., supply of special coupling gear in connection with Slacks Valley main feeders.

NEWPORT (MON.) EDUCATION COMMITTEE.—W. H. Bawn and Co., electric light installation at Alexandra and Eveswell Schools.

ARDING AND HOBBS, LONDON.—Electrical Installations, Ltd., lighting installation in connection with extensions of premises.

BROMLEY (KENT) CORPORATION.—General Electrical Maintenance Co., electric wiring of 63 houses on Southborough estate, £350.

BOLTON CORPORATION.—Corporation Electricity Department, electric light fittings, and boiler and cooker at new 'bus garage.

TYNEMOUTH CORPORATION.—Drysdale and Co., Ltd., installation of electrically driven portable pump at bathing pool, £196 2s. 6d.

Digitized by Google

METROPOLITAN WATER BOARD.—English Electric Co., Ltd., supply of electric motor to drive a pump at Hampton waterworks, £129.

STOKE-ON-TRENT CORPORATION.—Barnett and Soans, wiring and fittings for lighting and motors at Central Power House, Hanley, £971.

EATON BRAY RURAL DISTRICT COUNCIL.—Griffin Bros., wiring 34 houses for electric light at Stanbridge and Eaton Bray, £214 10s.

CARNARVON CORPORATION.—Electric Construction Co., Ltd., mains extension from Hampton Road around houses at Maes Cadnant, £136.

MOLD EDUCATION COMMITTEE.—G. F. Tristam, painting, electric light wiring, etc., of County Education Offices, £145. (Recommended.)

Electrically-Driven Oil Filter.

COLCHESTER CORPORATION.—Davey, Paxman and Co., Ltd., electrically-driven oil filter, for tramway department, £74 15s. (Recommended.)

DEPTFORD (LONDON) BOROUGH COUNCIL.—S. Jones, renewals of cables and supply and fixing of fittings at swimming baths, etc., £378.

COUNTY DOWN EDUCATION COMMITTEE.—J. Somerville, electric lighting and plumbing works at Newcastle (co. Down) Technical School.

HULL CORPORATION.—Hall and Stinson, Ltd., electrical work in 148 houses in course of erection on Derington Bank Farm housing site.

BURTON LATIMER URBAN DISTRICT COUNCIL.—A. J. Tarrant and Co., electric light wiring of 41 Council houses on Station Road estate, £205 8s.

CROYDON CORPORATION.—Kingsdown Electrical Co., electric light installation to blocks D. and E., and laundry at hospital, £206 (recommended).

LIVERPOOL CORPORATION.—E. Green and Sons, Ltd., renewal of 384 tubes of No. 1 economiser, at the Lister Drive power station, £1 329.

ST. PANCRAS (LONDON) BOROUGH COUNCIL.—T. H. Smerdon, electric wiring and fitting of block E on Wolcot Street housing estate, £375.

THIRSK PARISH COUNCIL.—Northern Electricity Supply Co., public lighting, with 108 lamps, from September 8th to April 12th next, £406.

ST. PANCRAS (LONDON) BOROUGH COUNCIL.—T. H. Smerdon, electrical installation at tenements in Wolcot Street, £375. (Recommended.)

DEPTFORD (LONDON) BOROUGH COUNCIL.—General Electric Co., Ltd., supply of electric light fittings at Borough Hall, £414. (Recommended.)

METROPOLITAN ASYLUMNS BOARD.—S. Reed and Sons, wireless installation at Princess Mary's Hospital for Children, £246. (Recommended.)

FULBOURN MENTAL HOSPITAL COMMITTEE (CAMBRIDGE).—Siemens-Schuckert (Great Britain), Ltd., installation of automatic telephones, £186.

HULL CORPORATION.—Credenda Conduits Co., Ltd., supply of "Creda" cookers for the purposes of the cooker hiring scheme, for 12 months.

LANARKSHIRE MIDDLE WARD DISTRICT COMMITTEE.—A. Robertson, electric lighting work in 52 new cottages at Overton Road, Cambuslang, £272.

REIGATE CORPORATION.—Callender's Cable and Construction Co., Ltd., supply and laying of h.t. feeder from the electricity works to Redhill, £1 574 6s. 3d.

METROPOLITAN ASYLUMS BOARD.—Fuller Accumulator Co., Ltd., installation of storage battery at the "Exmouth" training ship, £293 10s. (Recommended.)

BEBINGTON AND BROMBOROUGH URBAN DISTRICT COUNCIL.—A. Hallam electric light installation at the Victoria Hall, £39 5s., and at the Council Offices, £33 2s. 6d.

BIRKENHEAD CORPORATION.—Supply of cable: W. T. Glover and Co., Ltd., £889; Hackbridge Cable Co., Ltd.; £349; Liverpool Electric Cable Co., Ltd., £141 5s.

EASTBOURNE CORPORATION.—General Electric Co., Ltd., switchgear and transformers (£7 127 13s.), and Pirelli, Ltd., cable (£8 130) for extensions to Lower Willingdon, etc.

GLASGOW CORPORATION.—W. C. Yuille and Co., Ltd. pinions; Edgar Allen and Co., Ltd., manganese steel points; C. Churchill and Co., Ltd., portable electric tool post grinder.

SCUNTHORPE AND FRODINGHAM URBAN DISTRICT COUNCIL.—Adams Hydraulics, Ltd., sewage pumping machinery, comprising centrifugal pumps, electric motors, control panels, etc.

DUBLIN CORPORATION.—Mather and Platt, Ltd., electrically driven, automatically controlled pumps, with necessary fittings and auxiliary machinery, in three pumping stations, £3 635.

BEDFORD CORPORATION.—Pirelli-General Cable Works, Ltd., construction of six-wire overhead line, in connection with the extension from Kempston to Wootton Pillinge, £2 843. (Recommended).

SOUTH SHIELDS BATHS COMMITTEE.—Chas. Ramsay and Son, electric lighting repairs at baths, £48 18s.; British Insulated Cables, Ltd., supply of 60 kVA condenser, with switchgear, £225.

GENERAL POST OFFICE.—Telephone exchange equipment: Lee Green, Ravensbourne (Bromley) and New Cross, Automatic Telephone Manufacturing Co., Ltd.; Hindhead (Surrey), Siemens Bros. and Co. Ltd.

SLEAFORD URBAN DISTRICT COUNCIL.—Callender's Cable and Construction Co., Ltd., supply and laying of 550 yds. of four-core 0·5 and 500 yds. of four-core 0·06 lead-covered, double steel tape armoured cable, etc.

SOUTHEND CORPORATION.—Union Cable Co., Ltd., copper trolley wire, £409; British Insulated Cables, Ltd., h.d. copper trolley wire, £241; British Mannesmann Tube Co., Ltd., 36 medium and six heavy traction poles, £376.

SWINDON CORPORATION.—British Thomson-Houston Co., Ltd., two h.t. switchgear cubicles, with corresponding control panels and metering panel, £1 604 15s.; C. Churchill and Co., Ltd., equipment for the fitting shop at Moredon generation station, £321 18s. 3d.

BUENOS AYRES CENTRAL RAILROAD AND TERMINAL CO.—Metropolitan-Cammell Carriage, Wagon and Finance Co., Ltd., rolling stock for underground electric railway now under construction. The contract comprises 56 electric motor bogie coaches of all-steel construction. The contract for the electrical equipment of the coaches has been sublet to the General Electric Co., Ltd.

DEVIZES RURAL DISTRICT COUNCIL.—A. R. Fox, provision of electrical installation in cottages at Easterton, Great Cheverell, Market Lavington, West Lavington and Worton, £189. Also tendered: W. L. Simmonds, £189; W.E.S. Co., £215; G. W. Cross, £218; James Bros., £230; Howson, Jones and Co., £232; W. F. Hill, £240; V. H. Dipple, £268; General Installation Co., Ltd., £276.

BARKING URBAN DISTRICT COUNCIL.—Siemens Bros. and Co., Ltd., supply and laying of cable from Axe Street to the sewage works, £2 779. (Recommended.) Also tendered: Callender's Cable and Construction Co., Ltd., £2 851; Standard Telephones and Cables, Ltd., £2 872; W. T. Henley's Telegraph Works Co., Ltd., £2 875; Johnson and Phillips, Ltd., £2 884; Enfield Cable Co., Ltd., £2 919.

Signalling Equipment.

BOMBAY, BARODA AND CENTRAL INDIA RAILWAY.—Westinghouse Brake and Saxby Signal Co., Ltd., Supply of power signal material for the re-signalling, on the electro-pneumatic principle, of Bombay Central Station. The material includes a 119-lever power locking frame, a strip light type illuminated diagram, 35 a.c. track circuits, with track transformers, relays, impedance bond layouts, reactances and rail insulations, 34 electro-penumatic facing point layouts with point indication relays, compressors, switch-gear, etc.; 16 three-aspect colour light signals, and 21 two-aspect globe type shunt signals, with posts and fittings, two 7-way route indicators, 10 apparatus cases for relays, feeds, etc., and two 2-slide lever frames, for control of shunting yards. The actual installation will be undertaken by the railway company's signal department.

LONDON COUNTY COUNCIL.—Metropolitan-Vickers Electrical Co., Ltd., supply and installation of one rotary convertor at a tramway sub-station, with supervisory control, £5 568, remote automatic control, £5 168, remote semi-automatic control, £4 848 (accepted). Also tendered: Oerlikon, Ltd., supervisory control, £4 255, alternative £4 515 (tender incomplete); British Thomson-Houston Co., Ltd., £5 568; English Electric Co., Ltd., £5 568; British Brown-Boveri, Ltd., £6 299 (mercury arc rectifiers); Harland Engineering Co., Ltd., £6 467; General Electric Co., Ltd., £5 568, £5 168, £4 848; Bruce Peebles and Co., Ltd., remote semi-automatic control, £4 848; Mather and Platt, Ltd., £4 848; A. Reyrolle and Co., Ltd., £4 848; Electric Construction Co., Ltd., £5 200; Hewittic Electric Co., Ltd., £6 637 (mercury arc rectifiers); Crompton Parkinson, Ltd., supervisory control £6 558, remote semi-automatic control, £4 985 (alternative).

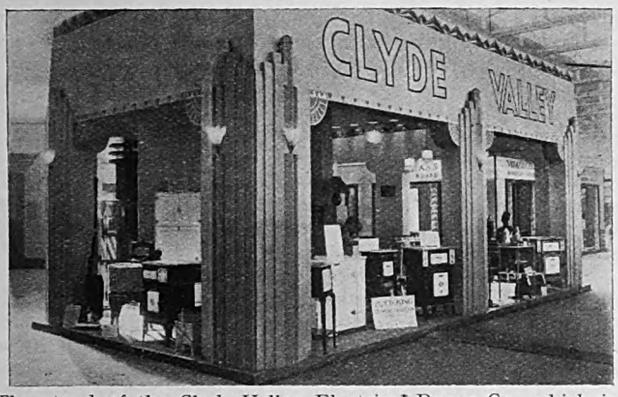
NEWS IN PICTURES

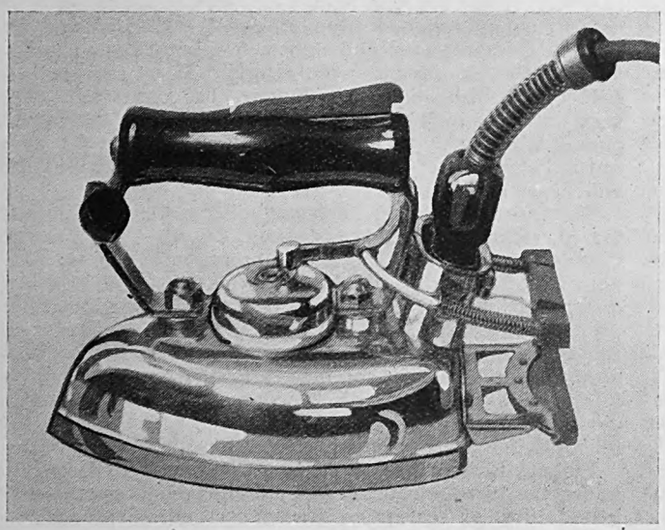
Mr. T. R. Martin, who, as announced on page 472, has been elected chairman of the Advisory Committee of the ElectricalSection of the B.I.F.

The striking window display, featured by Currys, Ltd., wireless dealers, of 20, St. Botolph's Street, Colchester, in connection with their Ever Ready Week display, which was held from October 7th to 12th. At the time of going to press the names of the prize-winners in the competition were not known.



The stand of the Clyde Valley Electrical Power Co., which is playing such an important part in the Housing and Health Exhibition at the Kelvin Hall, Glasgow. The show closes to-morrow, Saturday. One of the important functions of the Clyde Valley Co. is the supply of current in outlying districts, and assisting in the industrial development of rural areas by making available an adequate source of electrical energy.

A general view of one of the aisles at the Brighton Electrical Exhibition, which concludes to-morrow, Saturday. The exhibition is voted to be one of the most popular "local" shows so far held in this country, and considerable business is reported to have been done. A brief review of the exhibits and details of the competition held in connection with the exhibition are given on pages 462 and 469.



As will have been gathered from our description last week, a number of new items of electrical interest were shown at the International Exhibition of Inventions, which concluded last week. Among these was the device, seen above, for incorporation in electric irons, to switch the current off automatically when the irons are left flat on the ironing board. At the top of the handle is a lever. When the iron is in use and the handle gripped, the lever is depressed and a connecting rod throws the tumbler switch to the "on" position. When the iron is released, the switch is turned "off" by a spring.

It will be remembered that in THE ELECTRICIAN of September 13th, we gave particulars of a new force called "Chromadyno" which is claimed to be ten times more powerful than electricity. We have received this week a number of photographs from New Zealand illustrating some of the apparatus used in connection with this force. Of these we believe the above, of the main switchboard, to be most interesting. Note the "slow-motion" condenser dials left and right of the board.

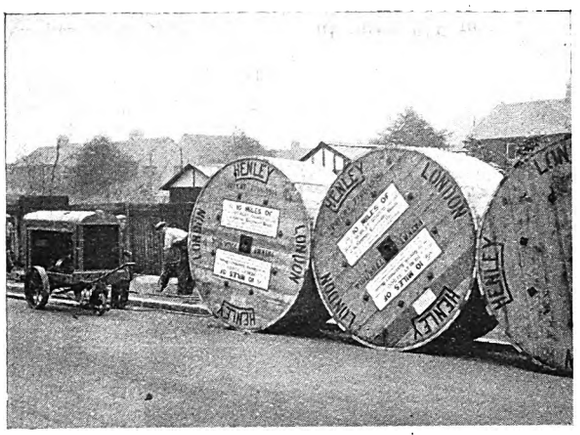
ELECTRICITY SUPPLY.

Loans for Mains, etc.—Clitheroe's Application for Wayleaves—Assessment of Electricity Undertakings—Increase of Domestic Load at Liverpool.

OLDHAM Electricity Committee has received sanction to borrow a further £50 000 for mains.

Plymouth Electricity Committee seeks sanction to borrow £65 000 for new mains and services.

Huddersfield T.C. is to seek sanction to the borrowing of £60 000 for mains, services and transformers.



IN connection with the cable installation work recently carried out in the Croydon area under the Central Electricity Board's scheme, "Henley's" achieved some good publicity by using each of the large drums as a poster hoarding. The posters read "Part of 10 miles of Henley 33 000 volt cable for the Central Electricity Board. Manufactured by W. T. Henley's Telegraph Works Co., Ltd., makers of the famous Henley Wiring System." As there were altogether about eighty drums used on the five-mile route, the publicity was fairly extensive. The illustration shows some of the drums, and a "Spiros" compressor at work.

East Ham Electricity Committee has passed an estimate of £3 308 for distributor cables in various streets.

Eastbourne Electricity Committee has decided to seek sanction to borrow £16 000 for the provision of a new 2 500 kW turbo-alternator and £16 000 for a new boiler.

Tonbridge U.D.C. has agreed to delete the clause in the assisted wiring scheme, "that consumers in the rural area pay one-third of the cost of installation in advance."

Col. T. C. Ekin, on behalf of the Electricity Commissioners, will hold an inquiry on November 13th, into the application of Barnes U.D.C. for consent to the extension of the Council's generating station.

Wimbledon Corporation is to seek sanction to borrow £30 000 for mains and services.—Sanction to borrow £15 000 for domestic apparatus for hire and £2 500 for sub-station equipment has been obtained.

Brighton Corporation has decided to proceed with part of the street lighting scheme to Patcham Place, at a cost of £700.—The Electricity Committee has obtained sanction for a loan of £12 200 in connection with the alteration of the system and pressure in the Patcham area.

Gravesend Corporation Housing Committee has received an application from 11 tenants in Sun Lane, on the King's Farm Estate, asking for permission to put in further electric lighting points in their houses. The Committee recommends that permission be granted on certain conditions.

The erection of the new sub-transformer station in connection with the Shannon electricity supply in Fleet Street, Dublin, is being rapidly pushed forward. Some British transformers have been installed. It is hardly likely there will be any transmission from the Shannon system to Dublin before next March.

Wellington (Somerset) U.D.C. has given its consent to an electricity scheme submitted by Whitehall Securities, which has taken over the undertaking of the Wellington and District Electricity Supply Co. It is proposed to lay a transmission line from Exeter, where energy will be taken in bulk from the Corporation works.

The Ministry of Transport's inquiry into Clitheroe Corporation's application for compulsory wayleaves for cables from Chatburn to Grindleton has resulted in granting them for five years, on the terms of the Corporation, 2s. 6d. per pole in meadowland; 1s. in hedgerow or pasture; and 1s. per 100 yds. of cable underground.

Sunderland Electricity Committee recommends the T.C. to carry out various schemes, estimated to cost £33 000, and including the equipping of additional sub-stations, the laying of new mains, and the replacing of obsolete switchgear.—The Committee is to consider the provision of fresh accommodation for meter testing apparatus workshops, etc.

Dorchester Electricity Committee expresses the opinion that the present method upon which electricity undertakings are assessed is unfair, and recommends that a letter be written to the I.M.E.A. stating that the Council considers that the question should be considered by the association, with a view to securing a revision of the method and basis of such assessments.

Portsmouth Electricity Committee is to seek power for an extension of the electricity supply area to the parish of Hambledon. The cost of mains, etc., is estimated at £5 100, and the extension would make a supply available to 169 existing premises.—The Committee has obtained sanction to borrow £8 000 for mains in connection with the bulk supply to the Petersfield Electric Light and Power Co.

Liverpool Tramways and Electric Power and Lighting Committee, last week, authorised a decrease of ¼d. per kWh in the flat rate charges for electricity, which has brought the tariff down to pre-war level. A corresponding decrease has been made in the maximum demand charges.—The Committee decided to recommend the adoption of an assisted wiring scheme.—The domestic load is increasing rapidly, electric cookers now in use numbering about 3 700.

Prof. Roberts, the Liverpool city analyst, and Mr. F. G. Martin, a Liverpool chemist, have expressed the opinion that the device of Mr. P. J. Robinson, the city electrical engineer, for abating the smoke nuisance of power stations will do what is claimed for it. The device is to be used at the new Clarence Dock power station. Details of the invention cannot yet be published.—Sanction has been obtained by Liverpool Tramways and Electric Power and Lighting Committee to the borrowing of £300 000 for prospective expenditure on unspecified electricity mains and services.

Electricity from the Irish Free State Electricity Supply Board's system is now being supplied in Portlaoghise. The majority of the business houses electrically lighted have been using current supplied from Messrs. J. J. Aird and Sons' Central Garage plant, and only a few houses were prepared to take the Shannon scheme supply. Many private householders are disinclined to complete the connections at present, as they would then become responsible for the valuation charge while using little or no current. They prefer to wait until the return of the long evenings, when early lighting will become necessary.

Sir Andrew Duncan, chairman of the Central Electricity Board, recently informed Stranraer T.C. that the Electricity Commissioners would shortly be preparing a scheme for the South of Scotland, and although this would not deal with distribution directly, it was hoped that it would stimulate proposals for large-scale distribution along lines favoured by the Board. In any case, so far as generation was concerned, a station at Stranraer for merely local purposes should not, in the view of the Board, be contemplated. The T.C. has decided to grant the Holderness Trust permission to apply for an Order to light Stranraer streets at 2½d. per kWh.

Fulham Electricity Committee recommends that consumers under the hired-wiring scheme be allowed to purchase their installations at cost price, less 5 per cent. depreciation for each year during which the wiring and apparatus have been installed.—Under the scheme, which was adopted by the Council in December, 1927, 1 303 premises in the borough have been wired. Eight contractors have been employed, and the work in all cases has been satisfactory.—It is proposed to experiment upon Harwood Road, at an estimated cost of £554 10s., by the provision of eleven public lighting points, comprising four special K and M arc lamps and seven lantern gasfilled lamps.

COMPANY NEWS.

Appreciation of Manufacturing Companies' Shares—Hurst, Nelson & Co.'s Hopeful Prospects—Directors' Reports and Dividend Announcements—New Company to Exploit Stille Inventions—Other New Companies.

CABLE manufacturing shares have been in demand during the past week, and British Insulated ordinary at 81s. 3d., Callender's at 80s., and W. T. Henley's at 131s. 3d. are all quoted 1s. 3d. higher. British Thomson-Houston shares have advanced from 22s. 6d. to 23s., and Ever Readies from 19s. to 19s. 6d. Cables and Wireless "A" and preference stocks have put on 2½ points, to 85 and 96 respectively. Marconi's Marine shares are 2s. 6d. lower, at £2 10s. Charing Cross and Metropolitan Supply preference shares, and County of London ordinary are all 6d. lower. Metropolitan and District Railway ordinary stocks are slightly better.

CHEAP ELECTRIC POWER CORPORATION, LTD.—It is announced that a mtg. of deb. hldrs. will be held to-day (Oct. 18) at 4 p.m. at the offices of Mr. Walter Thompson, 64, Cheapside, London, E.C.2, to consider serious position *re* British and Foreign Lime and Power Corporation, Ltd.

METDURO, LTD.—It is announced that, in view of the fact that the cash resources are ample for present requiremts., it has been decided to postpone further the paymt. of the first and final call on the pref. shs. until dates early in 1930, of which at least one month's notice will be given.

AGAR, CROSS AND CO., LTD.—Fin. div. on ord. cap., 6%, plus bonus of 5%, makg. 16% for year, tax free (same as preceding year). To res. £100 000, agst. £135 000. Fwd. £53 289, agst. £40 736. Ord. sh. transfer books are closed until Oct. 30, inclusive, for preparatn. of div. warrts.

INDO-EUROPEAN TELEGRAPH CO., LTD.—Intm. divs. for half-year ended June 30, 1929, at rate of 5%, tax free, will be payable on Nov. 1. Coupons (No. 119) of shs. to bearer will be payable on and after that date at the rate of 12s. 6d. per coupon, tax free, at Barclays Bank, Ltd., 54, Lombard Street, London, E.C.3.

EDISON ELECTRIC ILLUMINATING CO., BOSTON.—The Massachusetts Public Utility Commission has refused to permit the Edison Electric Illuminating Co. of Boston to split its stock four for one. The Commission said the company, instead of splitting its stock and leading shareholders to expect larger dividends, had better reduce the selling price to the consumer.

NEW YORK TELEPHONE CO.—Proposals will be received until noon, Nov. 1, at the office of the City Bank Farmers Trust Co., 22, William Street, New York City, for the sale to the trustee, in accordance with the provisns. of the mtge. dated Oct. 1, 1909, at not exceedg. par and int., of a sufficient number of bonds to invest the sum of $750 000 of the sinkg. fund.

GERMAN ELECTRICAL COMPANIES AND AMERICAN CAPITAL.—The "Financial Times" publishes a message from Berlin to the effect that Herr Von Siemens, head of the concern bearing his name, referred on Tuesday to the policy pursued by the A.E.G. (Allgemeine Elektrizitaets Gesellschaft) in reaching an agreement with the General Electric, which is now participating with the American Telephone Trust in a

Digitized by Google

merger of several German firms in the low current electrical industry. He commented on the need for German industry at present to obtain the support of foreign capital, but he was of opinion that this foreign money was watching for the moment when it could seize control.

GERMAN TELEPHONE MERGER.—A merger of the Mix and Genest Telephone and Telegraph Works Co., the Ferdinand Schuchard Telephone and Telegraph Co., and the South German Telephone Apparatus Co. is announced. It is stated that the majority of the shs. will be acquired by a holdg. co. in which the American International Telephone and Telegraph Co. will have a controllg. int. The cap. to be provided by the American co. will amt. to approximately £1 500 000.

PUEBLA TRAMWAY, LIGHT AND POWER CO.—Net pfts. for 1928, $1 256 247 (Mex.), agst. $1 372 278 (Mex.), equivalent to £128 242. Provisn. has been made for doubtful debts and contingencies, and after charging all exes., int. and sinkg. funds on prior lien and 1st mtgge. bonds and 8% note service, there is a deficit of £2 076. Gen. depresn. in industry of country, particularly in cotton, resulted in decreased earngs. from electric power and light, compared with 1927. Operatg. exes. were slightly higher than in precedg. year. Agreemt with Municipality of Puebla. providg. for regular paymt. of electric power and light accts. has not worked out as anticipated and is now in litigatn. Meanwhile, indebtedness of Municipality for power and light service is increasg.

AMERICAN AND FOREIGN POWER CO.—Gross earngs. of subsidiary companies for year ended June 30, 1929, $45 554 230, agst. $24 177 970; net earngs., $23 502 743, agst. $12 806 158; other income $2 679 481, agst. $1 487 935. Int., $2 170 273, agst. $1 630 604; pref. divs. $1 825 460, agst. $1 568 162; to renewal and replacemt. funds $1 562 232, agst. $1 436 346; proportn. applicable to minority int., $224 862, agst. $25 495; blce. $20 399 027, agst. $9 633 486. To this sum, wh. is taken into the American and Foreign Power Co's. accts., is added other income, $776 871, agst. $272 532, and from the total are deducted exes. and int., $1 921 577, agst. $588 766, div. on $7 pref. stk. and div. on $7 2nd pref. stk. series "A," leavg. blce. $5 104 066, agst. $1 459 781.

Company Meeting.

HURST, NELSON AND CO., LTD.—Mr. R. F. W. R. Nelson, presiding at the meeting on October 10th, said the year that they had passed through had undoubtedly been exceptional; in fact, it had been most abnormal. He had been asked at the works on the previous day how far they had to go back to find such a depression in the trade, and they found it was nearly 25 years. So far as the present was concerned—he would not say the future—he was very hopeful. Their order-book was more satisfactory to-day than it had been for a long time, and they were hoping and anticipating that the railway companies would have a bigger programme. As the shareholders knew, it was hoped at their meeting last year that the negotiations with other companies would terminate in amalgamation. These negotiations were, of necessity, very protracted, very difficult, and very delicate. These negotiations, carried on until summer time of this year, unfortunately had broken down, but they did not break down because of any feeling or any difficulty between the companies. All was agreed excepting the values of the various shares, and they felt that, despite the savings which could be effected by amalgamation, the capitalisation of the new company would be too great. The negotiations broke down entirely for that reason, but the companies got so close together at that time that they had been and were working more closely together than they had done before. The report and accounts were adopted and the dividends recommended therein were approved.

New Companies.

SAFAC ACCUMULATOR CO., LTD.—Cap., £500. Manufacturers of and dealers in accumulators, etc. Solicitors: W. R. Bennett and Co., 74, Great Russell Street, London, W.C.1.

FRED W. WOOD, LTD.—Cap., £1 500. Wireless engineers, dealers in apparatus for reception and transmission of pictures, and television, and wireless transmission, electricians, etc. Reg. Office: 24A, Bull Ring, Grimsby.

EMKABE RADIO CO., LTD.—Cap., £100. Manufacturers of and dealers in wireless and electrical goods, etc. Reg. Office: 47, Farringdon Road, London, E.C.1.

RADIO RECORDION, LTD.—Cap., £500. Manufacturers of, agents for and dealers in gramophones and phonographs, either separate or combined with cinematograph, wireless and/or television apparatus, etc. A provisional director: H. B. Pritchard, 19, Kingsland, Newcastle-on-Tyne.

UNIVERSAL CONSULTING PATENT, LTD.—Cap., £200. To acquire patents, rights, etc., to manufacture machinery, to carry on the business of mechanical, consulting and electrical engineers, manufacturers of electrical lamps and apparatus, etc. Reg. Office: Aldwych House, Aldwych, London, W.C.2.

JOHN RICHARDS AND CO. (LONGTON), LTD.—Cap., £1 500. To acquire business of electrical engineer and wireless dealer recently carried on by J. Richards at Longton, Stoke-on-Trent, as "John Richards and Co." Reg. Office: Stafford House, Trentham Road, Longton, Stoke-on-Trent.

POSTERMATIC, LTD.—Cap., £5 000. To acquire from Electric Mirrors, Ltd., an invention for automatic poster advertising and to carry on the business of advertising contractors and agents, manufacturers of and dealers in electrical and other signs, etc. Reg. Office: County Chambers, Corporation Street, Birmingham.

∴ The metal prices are supplied by British Insulated Cables Ltd.

THE LEAD MARKET.

James Forster and Co. report that slightly better demand from consumers has given a firmer tone to the market, and prices have advanced, although they are still below the association's idea of values. The firmness has also been assisted by a temporary shortage of arrivals. The future is obscure, and depends on the tactics employed by the Producers' Association. Under present conditions there seems little justification for any higher prices than those ruling, while, should demand ease off again, a lower market level may be expected. Closing prices on October 11th were £23 7s. 6d. for October and November, £23 8s. 9d. for December, and £23 10s. for January, 2s. 6d. per ton higher on the week.

TOPPING, Mr. S. G., West Street, Harrow (trading as GEORGE FLETCHER), electrical engineer. £22 0s. 4d. September 4th.

WESTON ELECTRICAL CONTRACTS CO., 17, George Street, Euston, dealers. £11 7s. 10d. August 9th.

Deeds of Arrangement.

BARSON, Alfred, 36B, Granby Street, and 124, Kimberley Road, Leicester, radio and electrical engineer. Dated October 11, filed October 14. Trustee, N. Alton, Morley House, London Road. Leicester, C.A. Liabilities unsecured, £1 603; assets, less secured claims, £620.

FURNESS, William Kates, 585A, Wilbraham Road, and 193, King's Road, Chorlton-cum-Hardy, wireless electrical engineer, Dated October 7, filed October 10. Trustee, G. H. Blair, 44, Brazennose Street, Manchester, I.A. Liabilities unsecured, £958; assets, less secured claims, £70.

SIMPKIN, Norman Jonathan, 5, Exchange Street and 55, Bromwich Street, Bolton, electrical engineer. Dated October 7, filed October 9. Trustee, A. T. Eaves, 47, Mosley Street, Manchester, C.A. Liabilities unsecured, £510; assets, less secured claims, £289.

Receivership.

FULL LIGHT ANTI-DAZZLE LAMP CO., LTD.—P. Mordant, F.I.C.A.; of 115/117, Cannon Street, E.C., was appointed receiver and manager, on October 2nd, under powers contained in debenture dated June 19th, 1929.

Private Meetings, etc.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

HUNTER, Sidney Alfred, trading as the ELECTRO GENERATOR COMPANY, 5, Uxbridge Road, London, W. A meeting of the creditors of the above was held recently at the offices of Cohen, Dunn, Page and Moore, solicitors, Audrey House, Ely Place, E.C. A statement of affairs was submitted which showed ranking liabilities of £674, including trade creditors for £494, and net assets expected to produce £254, or a deficiency of £420. The debtor's accountant reported that his client had been in business for more than twenty years, and had never previously been in difficulties. During the last year or two, the debtor had suffered through lack of capital, and a short time ago writs were issued against him by two creditors for substantial amounts. The debtor then entered into arrangements to sell his stock, and he was able to dispose of it to advantage, realising more than £900. That money was utilised in discharging the claims of pressing creditors, and paying off an overdraft at the bank. When the debtor disposed of the stock, he was under the impression that the assets would realise more than sufficient to pay the whole of his liabilities in full. An offer was made of a composition of 6s. 8d. in the £, which was subsequently increased to 10s. in the £. A resolution was passed agreeing to accept the amended offer.

PARSONS, Edward M., electrician and wireless dealer, 57, Paragon Street, and 58, Princes Avenue, Hull. A meeting of the creditors of the above was held on October 11th, at the office of Dawson and Lancaster, Hull, when a statement of affairs was submitted which showed liabilities of £4 562. Of that amount, £4 442 was due to unsecured creditors, and £120 to partly secured creditors, the total claim of the latter being £170, while they held security of the estimated value of £50. The assets consisted of cash in hand, £20; stock at cost, £659, valued at £450; trade fixtures, fittings, utensils, etc., £35; furniture, £150; work in progress, £50; shares, £5; Morris car, £50; good book debts, £467; and doubtful and bad debts £49, expected to produce £23. The total assets were £1 250, from which preferential claims of £149 had to be deducted, leaving net assets of £1 101, or a deficiency of £3 461. It was reported that the unsecured creditors' claims included cash creditors for £2 695, who had agreed to withdraw their claims in the event of the estate being wound up under a deed of assignment. After discussing the position, the creditors resolved that subject to the cash creditors withdrawing their claims, the deed of assignment, executed by the debtor in favour of Mr. J. J. Campbell as trustee, be confirmed.

London Gazette, etc.

Bankruptcy Information.

CAMEROFF, Joseph, 147, Spencer Place, Leeds, electrical engineer. Receiving order, October 11th. Debtor's petition.

COTTRELL, Thomas Chapman, 31, Autumn Street, Burley Lodge Road, Leeds, electrician, trading as THOMAS COTTRELL. Receiving order, October 12th. Debtor's petition.

DAFT, Hugh Edgar, Gloucester Place, Monument Street, Peterborough, Northampton, electrical engineer. First meeting, October 18th, 12 noon. Public examination, October 25th, 10.45 a.m., The Law Courts, Peterborough.

PHILLIS, William James, 87, Overton Road, Leicester, electrical engineer. First meeting, October 18th, 3 p.m., Official Receiver's Office, 1, Berridge Street, Leicester. Public examination, November 1st, 11 a.m., The Castle, Leicester.

SANDS, Chaloner Wilkinson, High Street, King's Langley, Hertford, electrical and wireless contractor. Receiving order, October 9th. Debtor's petition. First meeting, October 22nd, 2.30 p.m., 29, Russell Square, London, W.C.1. Public examination, November 27th, 10.30 a.m., Court House, St. Albans.

Notice of Dividend.

LITTLER, John, 9, Hoghton Street, Southport, electrical and radio engineer. First and final dividends, 2s. 6d. per £, payable October 25th, at the offices of the trustee, Arthur T. Eaves, 47, Mosley Street, Manchester.

Notices of Intended Dividends.

BRAYSHAW, Dunwell, 78, Granby Street, Liverpool, Electrician. Last day for receiving proofs, October 30th. Trustee, J. Allcorn, Government Buildings, Victoria Street, Liverpool, Official Receiver.

JOLIVARD, Kenneth Paul James, described in the Receiving Order as K. Jolivard and Co., 66, Victoria Street, London, S.W., electrical engineer. Last day for receiving proofs, November 2nd. Trustee, E. Parke, Bankruptcy Buildings, Carey Street, London, W.C.2, Official Receiver.

LAWRENCE, Louis Haydn (in the Petition and Receiving Order described as Henry Frederick Lawrence), 43, Canterbury Road, Margate, Kent, trading as Henry F. LAWRENCE, electrical engineer. Last day for receiving proofs, October 26th. Trustee, C. S. Scarlett, 5, Cecil Square, Margate.

Applications for Discharge.

KELLY, Morris, 12, Jackson's Row, Manchester, radio apparatus dealer. Hearing, November 4th, 10.25 a.m., The Court House, Quay Street, Manchester.

LANGLOIS, Herbert Augustus, trading in co-partnership with Daniel Timothy Donovan under the style of THE LONDON ELECTRICAL COMPANY, 119, St. Mary Street, Cardiff, formerly 124, Queen Street, Cardiff, electrical engineer. Hearing, December 3rd, 10.30 a.m., Law Courts, Cathays Park, Cardiff.

Order Made on Application for Discharge.

WOOD, Norman Hurst, lately 38, St. Charles Square, North Kensington, W.10, electrical engineer. Adjourned generally, February 21st, with liberty to restore.

Partnerships Dissolved.

ELEKTRA SUPPLIES (Joseph LANGDORF and James Garnet IVORY), importers and distributors of wireless and electrical components, 43, Grafton Street, Tottenham Court Road, London, W.1. By mutual consent as from September 30th, 1929. Debts received and paid by the partners.

REDCLIFFE RADIO MANUFACTURING CO. (Leslie Edward HICKS and Robert George HAWKINS), radio apparatus manufacturers, Phœnix Works, Temple Gate, Bristol, by mutual consent as from September 16th, 1929. Debts received and paid by R. G. Hawkins, by whom the business will be carried on.

WOODHOUSE AND MELLANBY (Philip Marshall WOODHOUSE and John MELLANBY), electrical engineers, Landbeach, Cambridge. By mutual consent as from April 24th, 1929. Debts received and paid by J. Mellanby, who continues the business.

COMING EVENTS.

Friday, October 18th (to-day).

North-East Coast Institution of Engineers and Shipbuilders.—Bolbec Hall, Newcastle-upon-Tyne. Presidential address by Mr. L. E. Smith.

Institution of Mechanical Engineers.—Storey's Gate, St. James's Park, London. General meeting. Presidential address by Mr. D. Adamson. 6 *p.m.*

Electrical Development Association.—Royal Society of Arts, John Street, Adelphi, London. Conference on "Personal Salesmanship in the Electrical Industry." Speaker, Miss G. Burlton. 7.30 *p.m.*

Saturday, October 19th.

Electrical Power Engineers' Association (Southern Division).—Hotel Cecil, Strand, London. Eleventh Annual Dinner. 5.30 for 6 *p.m.*

Monday, October 21st.

Institution of Electrical Engineers (North-Eastern Centre).—Armstrong College, Newcastle-on-Tyne. Inaugural address by the chairman, Mr. B. A. Robinson. 7 *p.m.*

Institution of Electrical Engineers (Mersey and North Wales-Liverpool Centre).—Lecture Theatre of the Laboratories of Applied Electricity, University, Brownlow Street. Chairman's address by Prof. E. W. Marchant on "Science and Electrical Engineering." 7 *p.m.*

E.L.M.A. Lighting Service Bureau.—15, Savoy Street, Strand, London. Twentieth Illumination Design Course. Lecture by Mr. L. E. Buckell on "The Lamp of To-day." 7 *p.m.*

Tuesday, October 22nd

Electrical Power Engineers' Association (London Technical Group).—E.L.M.A. Lighting Service Bureau, 15, Savoy Street, Strand, London. Discussion on "Modern Developments in the Electric Lighting of Public Thoroughfares."

Wednesday, October 23rd.

Electrical Association for Women.—46, Kensington Court, London. Social Sub-Committee "At Home." Evening social, with films of electrical interest. 7 *p.m.*

Thursday, October 24th.

Institution of Electrical Engineers.—Institution, Savoy Place, Victoria Embankment, London. Inaugural address by Col. Sir T. F. Purves. 6 *p.m.*

Institution of Electrical Engineers (Western Centre).—South Wales Institute, Cardiff. Reproduction of Col. Sir T. F. Purves' address to the London Centre. 6 *p.m.*

Friday, October 25th.

Institution of Railway Signal Engineers.—Criterion Restaurant, London. Annual dinner.

Birmingham Electric Club.—Grand Hotel, Colmore Row, Birmingham. Lecture by Mr. T. A. Windibank on "Motor Users and the Frequency Change." 7 *p.m.*

Junior Institution of Engineers.—39, Victoria Street, London, S.W. Paper by Mr. H. Bruff on "Electric Welding as Applied to Bridges and other Structures on the L. and N.E. Railway." 7.30 *p.m.*

Light's Golden Jubilee.

IF most of the world does not now firmly believe that EDISON invented the first practical incandescent electric lamp it is not the fault of those responsible for the organisation of the "Light's Golden Jubilee" celebrations, which culminated on Monday in broadcasts, newspaper articles, and special public illumination in many cities in America and some other countries. It is true that the world's indebtedness to SWAN was duly emphasised by Sir OLIVER LODGE in his talk from 2LO last Friday, but, in view of the ambitious nature of the American propaganda—the scope of which was known over here several months ago—it is disappointing that the British electrical industry failed to mark the occasion in a more spectacular manner. The trouble in cases of this kind seems to be that the electrical industry, though it possesses probably more trade and technical associations and societies than any other, has no body which can act for all in a matter which affects the prestige of the British industry. It would have been easy for such a body to have organised a SWAN celebration to coincide with the Edison festivities on October 21st, and wide newspaper publicity would have been secured. Those who do not understand our undue modesty in matters of publicity may well be pardoned for assuming that the British claim to the invention of the incandescent lamp is without foundation.

A Telephone Surprise.

THE surprise item broadcast from London last Friday immediately after Sir OLIVER LODGE'S talk on "The Beginnings of Electric Lighting," was for the most part excellent. It celebrated the Telephone Jubilee, and took the form of a talk by the Controller of the London Telephone Service, a few words by a London operator, and, finally, of relays from two exchanges. The best part of the transmission was the relay of the London Trunk Exchange. First one heard the operators at the switchboards devoted to incoming British calls. Then the scene was changed to the European section, and there was much conversation in German and other tongues less easy to recognise. But the incoming calls were intelligible—"is that Leeds 44621? Your Milan call."—"Hullo, Madrid wants you," and so on. Lastly, the microphone installed in the American service section was cut in, so that listeners heard not only calls between the United States and England, but understood something also of London's position as master switch in the Europe-America circuit. One heard, "Hullo, New York," and some instructions, followed by "Hullo, Stockholm," and so on. It was a remarkable example of how absorbing an outside relay can often be. There might well be more of such broadcasts, which combine educational value with entertainment to an unusual degree.

Electrical Salesmanship.

THE criticism that the London E.D.A. Salesmanship Conferences do not pay sufficient attention to the selling side did not apply to the first of the 1929 meetings, over which Sir ANDREW DUNCAN presided last Friday. In fact, the trend of Miss BURLTON'S talk was so much in the opposite direction as to draw protests from some of the technically-minded audience. Her description of the dullness and inertia of some of the electrical sales staffs was too near the truth to be very palatable, but the fact remains that electrical showrooms do exist in which the features she noted are readily noticeable, while instances of really adequate treatment by people who are obviously out to help the customer are sufficiently rare to linger long in the memory. Blame for this state of affairs must mainly fall on the chief engineers and managers who still regard selling as something that is undignified and slightly improper,

Digitized by Google

and that if it is to be indulged in at all, it can be accomplished by cheap, untrained labour which is too brainless or uninformed to perform a more technical task. As Miss HASLETT very rightly pointed out in the discussion, there is a serious lack in the industry of proper facilities for the training of sales staffs. But it is no use training such people unless provision is also made for employing them at salaries and under conditions that will attract and retain their services and interest.

A Capital Appeal.

WE do not apologise for a further reference to the urgency of the need of the Electrical Trades' Benevolent Institution for the wherewithal to carry on its very necessary work. On the contrary we desire to direct the special attention of all readers to the appeal which Mr. HOWARD MARRYAT makes on a later page of this issue. As this appeal points out, the small annual subscriptions to the fund only just meet the immediate claims for temporary relief. The growing number of cases of permanent disablement for which pensions are required cannot possibly be provided for while the capital fund stands at the pitifully inadequate figure of £37 000. The minimum sum necessary to permit adequate pension provision being made is £50 000. If only ten people will qualify for the vacant vice-presidencies of the Institution, fifty for life governorships, and three hundred for life membership, the necessary capital will be secured. We hope that readers who can afford to contribute under one of these headings will devote the money to this worthy purpose. At the same time, the rank and file should bear in mind that as every little helps, the comparatively unimportant sum representing one year's subscription is far more useful to the E.T.B.I. than regrets that one does not possess the larger capital sums now asked for.

Contractors' Problems.

As this week's correspondence columns show, there is no lack of interest in the major problems with which the electrical installation contractor is faced and which were so effectively set out by Mr. T. C. GILBERT in last week's issue of THE ELECTRICIAN. We have, in fact, received so many letters dealing with the associated questions of registration and wiring rules, that we are only able this week to print a selection. This must not be construed as a sign of intention to discourage full discussion of the matters at issue. On the contrary, so anxious are we to promote a crystallisation of thought on common ground that special arrangements will be made in next week's ELECTRICIAN to accommodate the views of all who have any constructive suggestions to offer. We propose to reserve comment on the letters until a later date, but it may be pointed out that the whole of the letters so far received are from electrical contractors. The views of men in other branches of the industry are particularly desired.

Progress in Illumination.

THE opening meeting of the Illuminating Engineering Society usually affords an opportunity of reviewing progress in the lighting field, and the report presented last Tuesday was exceptionally complete. Apart from the Society's own meetings and discussions there have been other gatherings at which lighting has played an important part—notably the recent annual conference of the Association of Public Lighting Engineers at Bournemouth. Other events have been the International Lighthouse Conference and the informal Aviation Lighting Conference, while at the annual gatherings of the I.M.E.A. and the E.C.A. the opportunity was taken to arrange special demonstrations of floodlighting. Reference is also made to the specifications and reports issued by various committees in which members of the Illuminating Engineering Society take part, such as those connected with the Illumination Research Committee, the National Illumination Committee, and the British Engineering Standards Association. In other countries illuminating engineering seems to be developing rapidly, and the International Illumination Congress to be held in this country in 1931, for which preparations have already been commenced, should be an event of outstanding importance. A continental development of special interest has been the organisation of "festivals of light" in many cities. No doubt before long we shall see something similar initiated in this country.

Radio Price-Cutting.

ALTHOUGH the price-cutting orgy in the radio retailing trade shows some signs of abating, the position to-day is still capable of much improvement. The people who carry on this sorry business are nothing if not bold, and the attention which they draw to their subversive methods may be said to have some value in indicating the source of the trouble. The latest example of price-cutting ingenuity, discovered in a London suburban shop selling electrical and radio appliances by our contemporary, "The Hardware Trade Journal," took the form of a window card bearing the notice that, "Owing to differences with various manufacturers regarding price cutting, we are obliged to leave several articles unpriced. Enquire within for cut prices." For sheer effrontery this example must be hard to beat. There certainly seems to be a *prima facie* case here for investigation by the appropriate trade organisations.

Railway Electrification.

CONSIDERABLE domestic orders for railway electrification work are definitely in prospect, following the welcome decision of the Southern Railway to electrify several additional portions of its system—notably the line from Purley to Brighton—and the proposed extension of the London "Underground" railways north of Finsbury Park. There is a tendency in some quarters to regard the Brighton scheme as a main line electrification, whereas actually the traffic density—almost exclusively passenger—and frequency of the service bring it well within the conditions of suburban transit. Apart from the advantages which this scheme will bring, the Southern Co.'s latest move may spur the other railways to greater interest in electrification possibilities.

A Dinner Need.

Now that the electrical dinner season has again arrived, electrical men and women are preparing, with what fortitude they can assume, to make the best of the business of coping with the fumes which the flashlight photographers produce at the *hors d'œuvre* stage. During sundry fume absorptions we have made diligent inquiries which have disclosed the awful news that one thing that electricity cannot do is to replace the explosive and potentially dangerous flash gun. We could never understand why this fairly simple service could not be performed electrically, and we would suggest that such an invention would bring heartfelt gratitude, if nothing else, to its designer.

THE OVERHEAD LINES ASSOCIATION.

New President and Officers Elected at Annual Meeting—Mr. Fennell's Review of the Year's Work—Value of a Post Office Concession.

THE annual general meeting of the Overhead Lines Association was held at the Institution of Electrical Engineers, on Wednesday, October 16th.

Notice was given that the Council proposed to revise and simplify the Articles of Association. The work of revision is in the hands of a sub-committee of the Council, and the revised articles will be submitted to members shortly.

The new President for the year 1929–30 is Mr. Theodore Stevens, who has previously served the Association as its honorary secretary. The meeting elected Major Theodore Rich as honorary secretary in his stead.

Members elected to fill vacancies on the Council, due to retirements by rotation, were Mr. R. Borlase Matthews (Past President), Mr. W. P. Gauvain, Mr. A. L. Stanton, Mr. F. Christy, and Mr. C. Wade (associate member). Mr. Swarbrick and Mr. Napier Prentice were elected honorary auditors. It is also the desire to elect vice-presidents. The Articles of Association do not at present provide for this, but Mr. W. C. Bexon and Mr. B. G. Drummond have been appointed, and will be elected as vice-presidents when the revised articles are approved.

The Association's Work.

Mr. W. FENNELL (the retiring President) made a brief statement on the work of the Association during the past year. As to general policy, he said that so far as the President might control the policy of an Association having an active Council, as this Association had, he had tried during this second year of the Association's work to avoid any agitation for relaxation of regulations. The amended E. C. Regulations for Overhead Lines were issued in the Spring of 1928, and it was only fair to work them for at least twelve months before dealing with them. A discussion of the effect of the amended regulations was worthy of an evening to itself.

The Post Office, a few months ago, had given way on the second-comer claim, to which end he had devoted much of his time during the last five years. The potential value of this concession was very great, because a great injustice had been removed, and expense had been obviated. The effect of this upon costs had needed time for demonstration, and he was pleased to say that it had been good.

Stressing the importance of greater freedom for electricity supply engineers in regulations relating to overhead work, he said it had been recognised for many years that the average electricity supply engineer was as expert in underground cable work as the average assistant to the Board of Trade Electrical Inspector, and the Inspectors left it at that and did not multiply detail. They had laid down plain principles many years ago, which were still unaltered and unadorned by complex procedure and unpublished exceptions and additions. Any suggestion to require plans to be furnished, forms to be filled in, and consents to be obtained, was unthinkable.

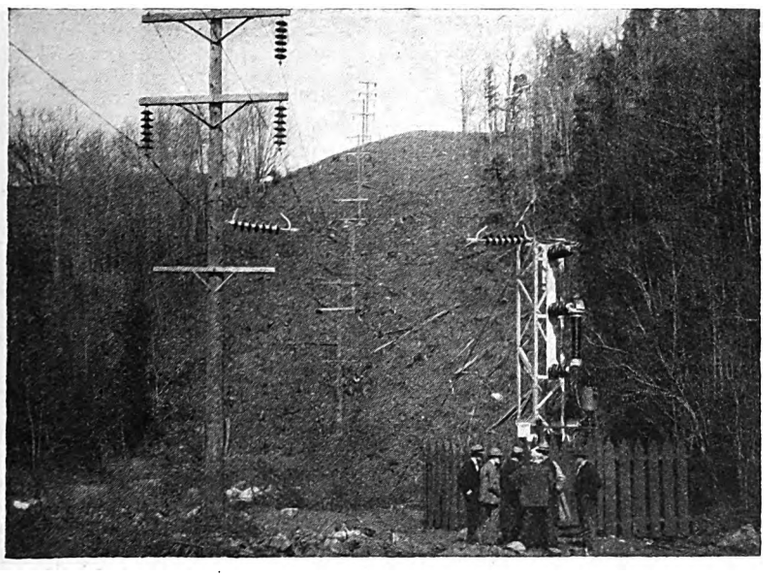
Because engineers felt full responsibility for results, they were careful and thoughtful. As a result, the art of cable, transformer and switchgear manufacture had advanced unhindered, until to-day, without any detailed regulation, they had evolved safe cable and apparatus far in advance of what they would have achieved if the details had been laid down 30 or even 10 years ago by officials, and (as in the case of overhead work) altered painfully and slowly as daring law-breakers had tried new methods and had agitated successfully to have them allowed. His (the President's) aim had been that engineers should achieve that standard of freedom and full responsibility in overhead work which they had always had in underground work; to achieve that they must show that they were as expert in overhead work as in underground work.

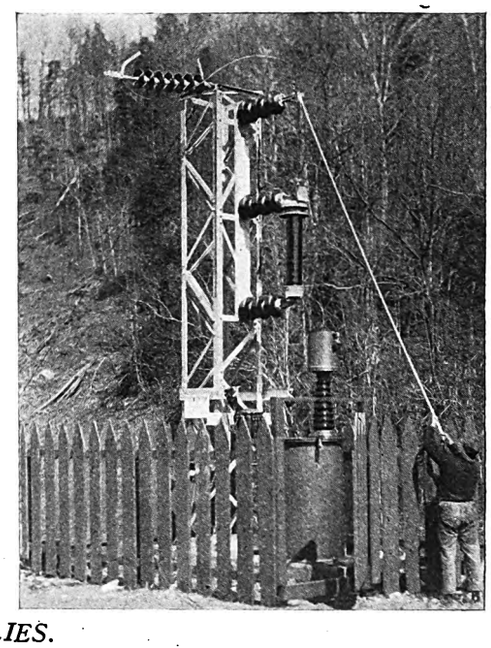
With the same object in view he had endeavoured, in conjunction with the Council, to secure a set of papers which would enable the members of the Association to obtain and to demonstrate their knowledge and caution in overhead construction work. In other words, the session had been a technical and not a political one. The visit to Mid-Cheshire in the summer was designed to exhibit a great variety of construction work.

He had also helped to initiate and to edit a monthly abstract of all papers and proceedings of the Association; this had been appreciated, especially by the more distant members.

The Council had been considering certain questions of standardisation, and last, but not least, the question of wayleaves. The railway crossing difficulty had become acute, and the Association had been in close touch with the railway companies on this matter.

The desirability of incorporating the Association had been considered, but the funds would not allow of both this and the continuation of the monthly abstracts, and the latter had had the preference. The matter would be further considered





TAPPING RURAL SUPPLIES.

IN view of the importance of tapping our main transmission lines for comparatively small rural loads, the above pictures of a new rural area sub-station developed in the U.S.A. are of interest. The picture on the left gives a general view of one of those small-capacity sub-stations tapping a 66 000 V transmission line between the line and earthed neutral to furnish a 50 kVA, 2 300 V single-phase service. The other picture is a close-up view of the same station showing the transformer.

The membership of the Association had increased considerably during the past year. Indicating the Association's work on bodies with allied interests, he said that it was represented on the Overhead Lines and the Overhead Lines Materials Committees of the B.E.S.A., and on the British Electrical and Allied Industries Research Association Ferro-Concrete Poles Committee.

Wayleave Agreements.

Following the annual general meeting, an ordinary general meeting was held, at which the necessity for a standard wayleave agreement form, and its character, was discussed.

The PRESIDENT (Mr. Stevens) said the Association had published its view in this connection, and had evolved the simplest wayleave form ever produced. Its view was that the ideal form must essentially be standard, simple and short. He emphasised that there should be no blanks to be filled in (except for names and the schedule), and that such a form should render unnecessary the intervention of solicitors.

Mr. R. BORLASE MATTHEWS (Past President) laid stress upon the well-known psychological fact that if people saw an agreement form in print they were prepared to accept the conditions laid down in it as being fair and reasonable, and to sign it. He estimated that between 90 and 95 per cent. of the people asked to sign it would do so. It was also essential to prepare a scale of payments fair to all parties, because the ordinary man did not know what to ask for a wayleave, whereas if he were shown a scale of payments which was recognised throughout the country he would accept it as being fair. No agreement would be acceptable if it were not fair to both sides.. One of the grievances among farmers was that when they were asked to give permission for transmission lines to cross their land, and when they in turn asked for a supply of electricity from those lines, it was sometimes refused, because the lines were high-tension lines. As a result, there was a movement among the farmers' organisations to recommend farmers to say that if the electricity supply undertakings would not give them a supply they would not allow the lines to cross their lands. To the man in the street, of course, there was something in that argument, and Mr. Matthews considered that undertakings whose lines crossed land under those conditions should pay more for their poles than they paid for poles carrying lines which were giving service in the district. He added that the high-tension lines carried far more current than the distribution lines, and, therefore, were able to bear higher charges.

Mr. FENNELL, who emphasised that wayleave agreements should be as short as possible, said he had published a standard wayleave agreement form for his own area, and it had been used with great success. He had found that the printing of such a form, including the printing of the amount to be charged, had enabled him to avoid arguments, and it could almost be said that in 99 cases out of 100 the landowners—for he ignored the tenants, inasmuch as they had not the power to make such an agreement—signed the agreements. He was prepared to send a copy to any who were interested. The form gave three weeks' notice, under the 1919 Electricity Supply Act, that it was proposed to erect a line, and the form was accompanied by a small plan (of which a carbon copy was kept). The fee was one shilling per pole or leg, and it was made clear that the electricity supply company accepted all risks. He had a line covering a distance of five miles on one estate, and the agreement was made on the form mentioned. There had been no squabbles; and the company was careful to pay up. The payment of solicitors' fees was unthinkable, and he had not paid one. One or two landowners had tried to do the business through solicitors, but as soon as they had realised the costs involved they had carried out the business direct.

The adoption of a standard form which was long and involved would render the position worse than it was to-day in the absence of a standard form, because small landowners would not sign it. All that was necessary was to state the names of those between whom the agreement was made, to describe the conditions and the premises, add a small plan, indicate the charges, and state that the electricity authority accepted all risk. As soon as an attempt was made to define the risks, landlords began to conjure up what the risks were, and became frightened. Further, if one had a standard form, and worked carefully, local opinion could be formed against a man who at first refused to sign until he got a higher fee; he realised quickly that it was no use standing out for a fee twice as high as that accepted by his neighbours.

Mr. MATTHEWS (U.S.A.), who was asked for information as to the practice in America, said there was a body of commissioners in practically every State, to whom the property owners or power companies could appeal. Usually, he believed, the power companies gave the commissioners ten days' notice that they wanted to erect a certain line, and at the same time they gave notice to the property owners concerned, and if no objections were raised by the time the notice expired, the power companies carried out the work. If a property owner objected, the difficulties were settled by the commissioners in a short time. If at any time damages were proved, arbitrators were appointed to assess them.

Miss PARTRIDGE (Electrical Association for Women) agreed that a standard form, which was simple and short, was essential, and urged the importance of ensuring that it should have the approval of a body such as the National Farmers' Union or some other such body which would carry weight with the landowners and farmers. It would also be a help if the approval of some law society could also be obtained. She was hoping also that the rural branches of the Electrical Association for Women would be able to help by guiding public opinion with regard to wayleaves for overhead lines, because it was of great advantage to supply authorities to have a favourable public opinion in districts where overhead lines were to be used.

Mr. BARTHOLOMEW (G.P.O.) pointed out that it was much more simple to proceed by notice, stating that, unless objections were raised, it was the intention to erect a line, than to obtain definite consent, because many people would not take the trouble to object when notice of the intention to do the work was given, neither would they take the trouble to give consent where consent was necessary.

Mr. F. CHRISTY supported the suggestion that the Association should get into touch with the National Farmers' Union and the Landowners' Association, because those two bodies were considering very closely the question of wayleave agreements generally. In two cases—one in Devonshire and one in Somerset—overhead lines a good many miles long were to be erected, and wayleaves were being sought; about half the people concerned had signed the agreements, but about 30 per cent. had stated that, although they saw no particular objection to granting the wayleaves, the Farmers' Union was looking into the matter, and they would sign nothing until the Union had made a statement.

Mr. FENNELL also supported the suggestion that the Association should get into touch with the bodies mentioned, and added that the Landowners' Society had produced a form which was shorter than that of the Electricity Commissioners, and more reasonable in respect of most of the details.

The PRESIDENT said there had been correspondence with the Land Agents' Society with regard to attending a meeting of the Association, and a representative of the National Farmers' Union had already attended a meeting of the Association.

Assistance from the E.A.W.

Mr. F. SWARBRICK, emphasising the great desirability of adopting a simple form, said he had followed the example of Mr. Fennell. Also, he had received considerable assistance from the local branches of the Electrical Association for Women, and was quite sure that that Association would be a source of strength in dealing with the problem of wayleaves.

Mr. J. SWAN said that for 25 years he had been erecting lines in Buckinghamshire, and until two years ago had used a very simple form of agreement, by which the persons concerned consented to the erection of the poles, the positions of which were indicated by a sketch; it was also stated that the supply company would make good all damage, and would pay one shilling per annum. That shilling covered any number of poles on one person's ground. More recently, however, high-tension lines were being erected, and it had been found that the very short agreement which had been so suitable hitherto was hardly suitable for the new circumstances. Consequently, a new form of agreement was prepared, but it contained very few clauses; it was an agreement with the landowner in each case that a fee of a shilling per pole and sixpence per stay be paid to the tenants of the lands on which the poles were erected, because it was felt that the tenants were the people who were affected by the erection of the poles. That agreement had been very successful.

Mr. C. F. MOUNSDON, supporting the suggestion that a

OVERHEAD LINES AND THE "GRID."

IN spite of the Minister of Transport's assent to the construction of the Central Board's overhead lines over the Sussex Downs, further efforts are being made to hinder progress, due to the mistaken idea that such lines will disfigure the countryside. The series of pictures printed above clearly shows that these objections are groundless. The pictures all show a portion of the single circuit, 132 000 V transmission line on the Yoker-Greenock route, and the photographs were taken with the camera at varying distances from the line. Reading from left to right, the two topmost pictures were taken at approximately 200 and 350 yd. distances, the next two at ½ mile and just over 1 mile, while the larger picture was taken at a point 1½ miles from the nearest part of the line. Except in the first two pictures, it is extremely difficult to locate the towers without the assistance of a microscope.

Digitized by Google

standard form should be evolved with the help of the Landowners' Association and the National Farmers' Union, expressed the view that it would be futile to attempt to evolve a form of agreement which had not their approval, unless there were sufficient power to enforce it against all opposition.

Mr. FENNELL, dealing with railway crossings, said that these were a source of great difficulty and expense. He had managed to get into touch with one or two of the railway companies, however, and had proposed, on behalf of the Association, that there should be one wayleave agreement as between each railway company and each electricity supply authority. for which agreement a supply authority would not mind paying a fee of, say, two guineas (because it would not be recurring); then the supply authority would pay five or ten shillings for each crossing of that railway company's lines to cover the cost of making the plans, and that a general schedule should be fixed for crossing as was fixed for crossing other people's lands.

Major THEODORE RICH (hon. secretary) said that the cost of crossing roads was often greater than it need be. In his local paper he had noticed reports of violent opposition to overhead lines, and, on the other hand, complaints with regard to the cost of electricity. It would be a great help if the public could be made to realise that increased costs of providing lines resulted in increased costs of electricity, and that they could not have it both ways.

Mr. NAPIER PRENTICE said that he had electrified eight districts in East Anglia, and had not paid for wayleaves. He had a simple wayleave agreement form in which the supply company acknowledged and expressed thanks for the wayleaves, undertook to make good any damage, and to remove the wires if required, on three months' notice. He had never been asked to remove wires except in cases where houses were being built on the routes, or for some other really good reason. There were local advisory committees, consisting of local people who were interested in the development of the districts electrically, and if a landowner objected to a wayleave unreasonably the committee's influence was brought to bear upon him. Why pay even sixpence per annum as a rental? The electrification of the land was worth more to the farmer than was any rental he would get.

The I.M.E.A. Form.

Mr. W. E. GROVES (mains engineer, Birmingham) said that the I.M.E.A. form had been used with a certain amount of success at Birmingham. He suggested, with a view to avoiding delay, that the signing of agreements should be left in the hands of wayleave officers. With regard to the notice to be given for the removal of lines from land which was required for development, he suggested that development should be defined as "building development," in order to provide against the giving of notice for insufficient reasons. The variation of payments from year to year, in accordance with the use which was being made of the ground in which poles were erected, he did not regard as practicable, because it would be a stupendous task to watch the variation of the class of cultivation or the state of the ground each year.

Mr. FENNELL said that one of the grid lines in the north-western area had been erected over a row of houses, and he understood that the rental was similar to that paid elsewhere. Therefore, the erection of a building did not necessarily involve removal of the line.

THE MOST EFFICIENT SIZE OF CABLE CONDUCTOR.

Some Important Considerations in Designing a Low Tension Distributing System for Heavy Loads—The Calculations Involved.

By C. G. WATSON, M.I.E.E.

IN designing a low-tension distributing system for small loads, the size of cable conductor is dictated largely by considerations of voltage drop. When heavy loads have to be distributed, however, it is often possible so to design that the most economic size of conductor is used. Therefore, a knowledge of that size is important to economic distribution, and an attempt is made herein to determine it.

The problem divides itself into three well-defined steps. They are: the determination of

1. The effective resistance of the conductor;
2. The economic current; and
3. The most efficient size.

Having outlined the method in the first three sections, I shall proceed to determine the most efficient size of conductor in four-core armoured cables laid direct in the ground for

4. One feeder cable;
5. Two feeders laid together;
6. One distributor.

Then, in triple concentric armoured cables under the like conditions in sections 7, 8 and 9.

1. *The effective resistance of a cable conductor:*

Let ρ = specific resistance of conductor in ohms at 15°C. in units of one thousand yards and one square inch.

And A = cross-sectional area of conductor in square inches.

Thus, the passive resistance of any conductor in ohms per thousand yards at 15°C.

$$= \rho A^{-1} \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad 1$$

Skin Effect.

But, owing to the skin effect, the effective resistance of a large conductor is materially greater than the result of the above calculation would imply. In fact, the relative increase of resistance from this cause may be expressed, within the limits of cable sizes, approximately as sA^2, where s is a constant depending on periodicity and position of conductor. Therefore, the effective resistance at 15°C. per thousand yards of conductor

$$= \rho A^{-1} (1 + sA^2) \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad 2$$

Further, let the relative increase of resistance due to rise of temperature = T. Then, and as the constant current necessary to produce that increase may be expressed approximately as δA^{ε}, where δ and ε are constants depending on the class of cable and the conditions of its working, the relative increase of resistance at any current C may be written $TC^2 (\delta A^{\varepsilon})^{-2}$. Therefore, the effective resistance R_c, at the current C, assuming that current to have flowed during a time sufficient for a constant temperature to have been reached,

$$= \rho A^{-1} (1 + sA^2) (1 + TC^2 \delta^{-2} A^{-2\varepsilon}) \quad . \quad . \quad . \quad 3$$

Or, putting $\rho s = k_a$, $\rho T \delta^{-2} = k_b$, and $\rho S T \delta^{-2} = k_c$,

$$R_c = \rho A^{-1} + K_a A + K_b C^2 A^{-(2\varepsilon+1)} + K_c C^2 A^{-(2\varepsilon-1)} \quad 4$$

That result applies to a conductor carrying the current C throughout its length, as a feeder would. But in the case of a conductor in which the current has a value C at one end, and evenly decreases to zero at the other end, the relative increase of resistance due to rise of temperature is one-third of what it is in the first case. Therefore, in a distributor, the effective resistance of a conductor

$$= \rho A^{-1} (1 + sA^2)(1 - 3^{-1} TC^2 \delta^{-2} A^{-2\varepsilon}) \quad . \quad . \quad 5$$

Or, using equation 4, k_b and k_c have one-third of the values they have in the case of a feeder.

2. *The economic current in a cable conductor:*

The total yearly cost of a main, per one thousand yards,

$$= \rho(\alpha + n\beta A) + nC^2 R_c K + G \quad . \quad . \quad . \quad . \quad 6$$

Where p = capital charges per year for interest and depreciation in terms of unity.

α = cost of excavation and reinstatement of trench plus constant part of cable and laying cost in pounds per thousand yards.

β = a cost constant depending on class of cable in pounds per thousand yards.

n = effective number of conductors in cable.

K = cost of one watt of loss per working year in pounds $= fm\ c_m\ 8760 \times 10^{-3}$, fm being the mains loss factor, and c_m the cost per unit of loss.

And G = value of losses in sheath, armour, and dielectric, all hereinafter assumed to be so slight as to be negligible.

It is to be noted that I make no allowance for the variation of conductor resistance throughout the year. I do so because further factors would only complicate without adding greatly to accuracy.

Digitized by Google

Substituting in formula 6 the value of R_c from 4, the yearly cost per thousand yards of main becomes

$$p\alpha+np\beta A+nKC^2\{(\rho A^{-1}+K_a A+K_b C^2 A^{-(2\varepsilon+1)}+ K_c C^2 A^{-(2\varepsilon-1)})\}$$

And, differentiating with respect to A and equating to zero, least cost is when

$$np\beta-nKC^2\rho A^{-2}+nKK_aC^2-(2\varepsilon+1)\,nKK_bC^4A^{-(2\varepsilon+2)} -(2\varepsilon-1)nKK_cC^4A^{-2\varepsilon}=0$$

whence

$$C^4[(2\varepsilon+1)K_bA^{-(2\varepsilon+2)}+(2\varepsilon-1)K_cA^{-2\varepsilon}]+C^2(\rho A^{-2}-K_a)=\rho\beta K^{-1}$$

Put $K_b(2\varepsilon+1)=X$, $K_c(2\varepsilon-1)=\psi$, and $\rho BK^{-1}=V$.

Then, $C^4(xA^{-(2\varepsilon+2)}+\psi A^{-2\varepsilon})+C^2(\rho A^{-2}-K_a)=V$.

Or, putting $XA^{-(2\varepsilon+2)}+\psi A^{-2\varepsilon}=j$,

and $\rho A^{-2}-K_a=l$,

$jC^4+lC^2=V$.

Whence $$C_e=\sqrt{\sqrt{Vj^{-1}+\cdot25l^2j^{-2}}-\cdot5lj^{-1}} \quad . \quad . \quad 7$$

C_e being the economic current at peak load

The immediately preceding result applies to a feeder. For a distributor, the case is somewhat different.

Assuming that the current decreases evenly along the length of the cable, the C^2R loss in a distributor is one-third of what it would be in a feeder with the same current entering. Therefore, the formula for the total yearly cost of a distributor is

$$p(\alpha+n\beta A)+nC^2R_cK3^{-1} \quad . \quad . \quad . \quad . \quad 8$$

R_c in this case being the effective resistance of a distributor.

Whence $$C_e=\sqrt{\sqrt{3vj^{-1}+\cdot25l^2j^{-2}}-\cdot5lj^{-1}} \quad . \quad . \quad 9$$

3. *The most efficient size of cable conductor :*

Again, the total yearly cost per thousand yards of main, omitting G,

$$=p\alpha+np\beta A+nC^2R_cK \quad . \quad . \quad . \quad . \quad 10$$

Therefore, the total yearly cost per ampere at the economic current

$$=(p\alpha+np\beta A+nC_e^2R_cK)C_e^{-1} \quad . \quad . \quad . \quad 11$$

By substituting in 11 the value of R_c from 4, and by substituting in the result the value of C_e from 7, a formula is obtained involving A as the only unknown. By differentiating and resolving, the value of A to give least total cost per ampere may be derived. That is to say, the most efficient size of conductor is obtained.

But the resulting equations are so cumbersome and the work involved in proceeding thus is so laborious, that I leave the solution by this method to one more skilled than I in such matters, and proceed to get the result aimed at in another way. I do this all the more readily because figures will be obtained which will be useful for other purposes. What I do, therefore, is to give practical values to the various constants and work out the cost for each size of conductor. Then least cost is found by inspection.

4. *The most efficient size of conductor in low-tension four-core armoured cables laid singly direct in the ground and used as feeder :*

The values I assume for the constants are :

ρ $=0\cdot024$.
s $=0\cdot36$. (at 50 ~)
T $=0\cdot2$.
δ $=770$. } —These two values follow from the
ε $=0\cdot564$. } figures given in Melsom and Booth's paper in Vol. 61 of "Journal of I.E.E."
p $=0\cdot08$.
n $=3$.
β $=1\,500$.
K $=0\cdot00714$. (This is on the assumption that yearly load factor is ·3, that the cost per kilowatt of maximum demand is £5 a year, and that the cost per unit of energy is ·3d.)

Then, the secondary constants have these values :

K_a $=0\cdot00864$,
K_b $=0\cdot81\times10^{-8}$,
K_c $=0\cdot292\times10^{-8}$,
x $=1\cdot72\times10^{-8}$,
ψ $=0\cdot0373\times10^{-8}$,
V $=16\,800$,

and, as a step towards our aim, the values of C_e, R_c, $C_e^2R_c$, $C_e^2R_cKn$, and $n\rho\beta A$ are given in Table I.

I must here remark that the results of the calculations are given to three significant figures, not because the results of actual practice are expected to conform to the figures to that extent, but in order to show the relative order.

TABLE I.

A	C_e	R_c	$C_e^2R_c$	$C_e^2R_cKn$	$np\beta A$
0·06	49·2	0·408	988	21·2	21·6
0·1	81·2	0·248	1 640	35·1	36·0
0·15	121	0·168	2 450	52·4	54·0
0·2	160	0·128	3 270	70·1	72·0

0·3	240	0·0887	5 100	109	108
0·4	313	0·0694	6 810	146	144
0·5	389	0·0582	8 800	188	180
0·6	468	0·0511	11 200	239	216
0·8	628	0·0432	17 000	364	288
1·0	797	0·0396	25 200	539	360

Now, giving values to α of 1 000, 500, and 250, and using formulas 10 and 11, we get the results given in Table 2.

TABLE 2.

	α=1 000		α=500		α=250	
A	Total Yearly Cost of Main. £	Cost per ampere per 3 conductors per year per 1 000 yds. £	Total Yearly Cost.	Cost per amp.	Total Yearly Cost.	Cost per amp.
0·06	123	2·50	82·8	1·68	62·8	1·28
0·01	151	1·86	111	1·36	91·1	1·12
0·15	186	1·55	146	1·21	126	1·05
0·2	222	1·39	182	1·14	162	1·02
0·25	258	1·30	218	1·10	198	1·00
0·3	297	1·24	257	1·07	237	**0·989**
0·4	370	1·18	330	**1·05**	310	**0·989**
0·5	448	1·15	408	**1·05**	388	0·998
0·6	535	**1·14**	495	1·06	475	1·02
0·8	732	1·17	692	1·10	672	1·07
1·0	979	1·23	939	1·18	919	1·15

The figures show—what, indeed, an inspection of formula 11 would show—that the cost per ampere (and so the cost per unit sold) depends appreciably on α; and that the most efficient sizes of four-core armoured cable are 0·6, when $\alpha=1\,000$; 0·45, when $\alpha=500$, and 0·35, when $\alpha=250$. It were well, therefore, to split that constant into its components in order to see what other light can be let in; call α_1 the cost of excavation and reinstatement, and α_2 the cost of cable and laying irrespective of conductor size. Now, for the cables in question, α_2 approximates to £250 per thousand yards, and so the figures appearing in the last two columns of Table 2 apply to the case of a cable and its laying when the excavation costs are omitted.

An Interesting Conclusion.

And so we reach the interesting conclusion that, under certain conditions, it may be economical, apart altogether from mechanical considerations which have no place herein, to lay two, or more, cables to work in parallel in one trench (seeing that excavation cost is no greater for two than for one cable). That is to say: when the total current to be carried exceeds a certain amount, two or more cables of the same size, each carrying its proper proportion of the load, should be laid together.

5. *The most efficient size of conductor in four-core armoured cables laid two in one trench and used as feeder.*

There is this point to be remembered: when two or more cables, each of same size, are laid close together, the heating effect is greater than when one cable of similar size is laid alone, current density, of course, being the same in each case. The effect of laying two cables of one size in the one trench and centres 6 in. apart is shown in Table 3. The constants in this case, where they differ from the preceding, are :—

δ $=616$
K_b $=1\cdot26\times10^{-8}$
K_c $=0\cdot455\times10^{-8}$
x $=2\cdot69\times10^{-8}$
ψ $=0\cdot0583\times10^{-8}$

TABLE 3.

A 0·4 conductor being the most efficient size of distributor cable, but it is to be noted that the economic current is higher than the safe current.

7. *The most efficient size of Triple Concentric Armoured Cable used as feeder and laid singly direct in ground :—*

The constants, where they differ from those for a 4-core cable, are :—

$s=0·07$ (The mean of the inner and outer conductor values in a concentric cable at 50~. It is based on the assumption that the skin effect in a stranded conductor is equal to that in a solid conductor of equal resistance per unit length ; but it is much to be desired there were experimental confirmation of this.)

$\delta=870$

$\varepsilon=0·590$ and $n=2$

The results appear in Table 5.

Here, again, the economic current in the most efficient size is higher than the safe current.

Before I end, I have a debt to pay. The calculations, the results of which appear herein, have all been made by my brother, H. F. Watson. That he has had no light task, only those having experience of such calculations will fully appreciate ; why, the calculations leading to the approximation for the skin effect were, at any rate to myself, appalling. Therefore, to my brother, all those who have been interested by this article, owe thanks.

BOOK REVIEW.

Relais und Schutzschaltungen in elektrischen Kraftwerken. By REINHOLD RUDENBERG. Pp. 280. 25.50 Marks. (Berlin : Julius Springer.)

The work under review is one of the most extensive in its scope that the reviewer has seen ; it deals with the design, construction and operation of relays of all kinds and for all purposes. The work is divided into seven chapters, each of which is written, under the editorship of Dr. Rudenburgh, by a well-known engineer ; each approaches the subject of relay operation from a different viewpoint. The first chapter shows various systems of networks in Germany with central stations, sub-stations and the run of e.h.t. transmission lines ; the necessity for adequate protection is emphasised. The second chapter deals with principles of protection (several circuit diagrams are given) and the effects of improper or inefficient protection are illustrated. Insulators and line masts are shown in illustrations destroyed through the effects of extensive corona. Figs. 14, 15 and 16, with the text relating to them, are interesting from the fact that a comprehensive idea of corona, and its effect, from e.h.t. lines is given ; the calculations are valuable. This chapter also includes illustrations of breakdowns (due to surges) of coils, oil switches, stator windings and transformer coils. This chapter is an excellent introduction to the remainder which deal with the design, construction and operation of relays proper. The third chapter may be said to be a description of experiments carried out on relays of simple and more intricate design. Pieces of wire and slotted drums are illustrated operating in magnetic fields of various types and the results are shown in graph form. Several dozens of experiments are described and illustrated ; they are food for thought for the designer who may be hesitating over a particular line of proceedure in a design. The next chapter is devoted to the application of relays proper to various systems of distribution. Many types of relay are illustrated, both with their schematic diagrams of connections to the apparatus they are intended to protect, and as they appear with their covers on and off. The remaining chapters are written on the same lines dealing with more or less intricate systems of protection. To those interested in the subject, the work is to be commended ; this merely from an instructional point of view since some of the applications suggested are not possible at the moment in this country.

SCIENCE AND ELECTRICAL ENGINEERING.*

Why Scientific Work of a Fundamental Nature should be Encouraged—Industry's Indebtedness to the Scientist—The Discoveries of To-morrow.

By Prof. E. W. MARCHANT, D.Sc., M.I.E.E.

THERE is, of course, a very big step between Faraday's experiment and the 160 000 kW alternators that are being built to-day. There are many men such as Gramme, Pacinoti, Siemens, Wilde, John Hopkinson and Parsons whose work as engineers has brought the generator of electrical energy to its present efficiency and size. Although I do not wish to minimise the services of these and many other eminent engineers, it is well to remember that the whole technique of the production of electrical energy could be altered, if some other method than the steam boiler turbine and alternator were discovered which would enable a larger fraction of the energy in coal to be transformed directly to electrical energy. All scientific work, therefore, of a fundamental nature should receive encouragement, for it is possible that entirely new methods of controlling the electrons which we now know constitute an electric current may be discovered. Our knowledge of the fundamental nature of matter has undergone a profound change since Faraday made his great experiment, and it does not seem beyond the realm of scientific possibility that some methods may be devised of setting electrons in motion by other methods than those with which we are familiar.

Another branch of electrical engineering which had its beginning in more or less academic scientific discussion was cable telegraphy. The idea of telegraphing across the Atlantic was one which had appealed to many electrical engineers, and it was in 1856 that the money was raised which enabled the first cable to be laid, but the theory of cable transmission was not clearly understood. After Kelvin's delicate syphon recorder had been constructed, cable telegraphy became a practical thing, and a great step had been made in practical electrical engineering.

We have celebrated recently the work of Alexander Graham Bell. His serious study of electricity was undertaken with a view to understanding and repeating Helmholtz's experiments in the artificial production of vowel tones.

Nowadays we are so familiar with telephony that we perhaps fail to realise what a change it has made in our lives. One man can now do a volume of administrative work which would have been impossible without it, and the saving of time and trouble to the ordinary man is incalculable.

High Frequency Currents and Wireless Telegraphy.

I have referred quite recently to the developments that arose from Lord Kelvin's paper on "The production of high frequency currents by the discharge of a condenser through an inductive coil." That paper was really the starting point of wireless telegraphy. I remember, too, a paper by the late Mr. Duddell on the direct current arc, which was read before this Institution, in which he showed how it was possible to produce electrical oscillations in an ordinary carbon arc by shunting it with a condenser and a coil. At the time it seemed a very interesting experiment with very little practical application, but it was found by Poulsen that if the arc burnt in an atmosphere of hydrogen and in a strong magnetic field the frequency of the oscillations which it produced could be raised to values which might be applied in wireless telegraphy, and its utility became apparent. At the time of the war the Poulsen arc, as it is now generally called, became the best known means of producing continuous high frequency oscillations. Nowadays it has, of course, been replaced by the valve.

There is a good deal to be said for what Lord Rayleigh called "wild catting" in experimental research. The introduction of the third electrode by Lee de Forest was made in this way. It is evident that he had very little understanding of the action of the three-electrode valve when he first made one. The use of the third electrode was one of the greatest steps in the development of the technique of the thermionic valve, since it was after the insertion of this electrode that it became possible to use the valve as an amplifier and generator of electric waves.

The discovery of the fact that the resistance of selenium is reduced when exposed to light was first applied by Shelford Bidwell in an attempt to transmit pictures, and the photo-electric properties of potassium and potassium-sodium alloys were studied by Elster and Geitel. At a soirée of the Royal Society over 20 years ago there was a demonstration given by Prof. Fleming of a sodium-potassium photo-electric cell which gave an e.m.f. of nearly 0·5 V and a current of 5 mA. The advantage of the cell, as compared with selenium, is that it is very nearly instantaneous in its action and gives its current almost immediately after a beam of light falls on it. The practical possibilities of these results were obvious, but it has taken nearly 20 years for the "talkie" to emerge, for it was only after the methods of amplification that have been made possible by the valve had been perfected that the production of the currents from these cells became useful in practice.

Television also may become practicable in course of time. That is another application of the same experiment.

Wireless Echoes.

Perhaps the most interesting observations that have been made within recent months in wireless telegraphy have been those by Stormer and Hals on wireless echoes of long delay. Stormer has noticed that in some cases an echo of a short wave (with a wave length of about 30 metres) signal appeared to return to the sending station as long as three minutes after it had been sent out. Many observations of this kind have been made, the time interval ranging from several seconds up to over four minutes.

A very interesting paper by Pedersen has recently been published in which he has discussed the possible explanations of this result. He has shown that it cannot be explained by a signal, which goes round and round the earth continuously, for the attenuation of the wave would be too great, neither can it be explained by a lowered group velocity in the space above the Heaviside layer. The theory which meets the facts most successfully is that the wave penetrates the Heaviside layer, impinges on an electrical stream of charged particles emitted by the sun and, in some way, is reflected back again to the earth. It is estimated that the length of path necessary to account for the delay in the echoes must be over 75 million kilometres, so that the signal must have traversed nearly a quarter of the distance to the sun before returning once more. The theory is borne out by the fact that these echoes are only heard at times of magnetic storms, when it is known that sun spots are actively sending out streams of charged electrons. The results are of considerable interest scientifically. If confirmed, they would appear to be the first records of signals sent out from the earth which have penetrated the upper regions of the atmosphere and returned again.

Such are some of the fundamental scientific discoveries which have proved of importance to the electrical engineering industry. But there are many other sciences which have been of great value to electrical engineers.

Some of the most valuable scientific work that has been done within recent years is that on engineering materials. It is, of course, many years since Barrett, Brown and Hadfield first published their researches on silicon iron and showed how much smaller were the losses in this material when subjected to alternating magnetisation than with ordinary iron. It is not too much to say that the discovery of silicon iron enables as great an advance to be made in the design and construction of transformers as any other single experimental fact. It enabled the designer to reduce the weight of the iron cores of transformers to nearly half the value that would have been needed without it, and simplified the problem of cooling the transformer.

More recently the discovery of cobalt steel has led to almost as big a revolution in the design of permanent magnets. Before its discovery a coercive force of 60 or 70 with tungsten steel was the greatest that had been possible (and this was a great advance on the figures with iron containing no tungsten), but a coercive force of nearly 250, such as is now possible with a steel containing 20% or 30% of cobalt has enabled permanent magnets to be made of less than one-third the weight previously required. Instead of the heavy horse-shoe magnets previously

* Extracts from the chairman's address to the Mersey and North Wales (Liverpool) Centre of the I.E.E., at Liverpool, on October 21st.

Digitized by Google

needed in magnetos, it is now possible to use short straight bars 3 in. long and 1½ in. wide, bars such as no maker of permanent magnets would have attempted to use with materials of lower coercive forces.

Another alloy which has enabled great developments to be made is the nichrome wire now used so universally in radiators and heaters of all descriptions. In this connection I should like to refer to a series of experiments that has been made recently in this laboratory by Mr. E. C. Walton, on the causes of failure of such substances when used in cookers and boiling plates. The chief cause of failure is the presence of salt in any solution that may fall on the heated spiral. If such a spiral is immersed in water and heated, it will last well, but as soon as salt is present, electrolysis occurs, and the metal corrodes rapidly. Milk also causes the spiral to become heavily coated with a thick hard mass which prevents the radiation of heat and finally causes the failure of the element. Fatty substances which do not contain salt have very little effect on the heated spirals.

The effect of electrolytic corrosion with a.c. is very much less than with d.c. With one such wire electrolysis led to its breaking after only 20 minutes immersion in a 1% salt solution when direct current was passed through it, whereas the same wire lasted nearly 3 hours when alternating current, having the same R.M.S. value, was used to heat it.

In milk the same wire lasted 1 hour 55 minutes when direct current was passed through it, while with alternating current of the same R.M.S. value the wire showed comparatively little deterioration after 10 hours immersion. This fact is of interest to central station engineers who are now changing over their systems from d.c. to a.c.

Distribution Problems.

One of the most important problems before the supply engineer to-day is the economical design of the transmission network. In some cases the cost of the distributing network is four times as much as the cost of the generating plant. The problem is one which requires intensive study, since the cheapening of the cost of electricity depends as much on a reduction in the cost of the distributing network as on any other factor. Here again, science and scientific method has been able to render notable service. A most valuable series of researches was undertaken by the Electrical Research Association, the results of which have been published in the "Journal of the Institution of Electrical Engineers," with a view to determining the maximum current that can be sent through buried cables without danger to the insulation. This information is now available to the supply industry, and will save it many hundreds of thousands of pounds.

It is almost universal in South Africa for the supply systems to remote districts to consist of overhead lines. The distributing network is carried by overhead wires supported on steel or ferro-concrete poles. Provided care is taken in the placing of these poles their presence is almost unnoticed and the saving in cost as compared with underground cables is very considerable. The problem of supplying electrical energy to the suburbs of towns like Johannesburg or Cape Town is more difficult than it is to the more concentrated towns in England, but with the development of the suburban area, with 8 houses to the acre, which now surround all our big towns, it would seem to be inevitable that the distributing network must be carried overhead unless the cost of electricity is to become prohibitive.

It is possible also that for remote districts with a very bad load factor, it may be possible to use iron wires instead of copper and aluminium. If this is done it is important to have an exact knowledge of the behaviour of the metals which may be used as substitutes. Some figures giving the magnetic and electrical characteristics of such wires, and the chemical composition and treatment that results in the best quality, have recently been published by Mr. Walton, and it is to be hoped that similar results will be available for the other cheap materials, giving the same detailed particulars of the mechanical and chemical properties of the substances to which they relate.

I was interested to find on a visit that I made this summer to South Africa, that the study of lightning and the nature of lightning discharges had been of no small service to the engineers in charge of the recently electrified Natal main line. During the summer the lightning storms in this district are very severe, and when electric traction was first installed, the interference with the working by the almost continuous lightning storms threatened to jeopardise the success of the undertaking. The research engineers of the railway, however, made a complete study of the nature of the breakdowns, and have been able to prevent undue interference, and have thus saved the electrified scheme from failure.

Measuring and Recording Apparatus.

Electrical engineering is concerned primarily with the construction of apparatus for the generation and distribution of electrical energy, or as a means of communication, but like other applications of physical science, it owes much of its progress to accurate measurement and observation. The devising of instruments and apparatus for observing and recording, has proved of incalculable value to the electrical industry. It was my good fortune to be associated for many years with the late Mr. Duddell, and I venture to think that the practical progress he made with the oscillograph and the power it gave of observing quantities that were varying very rapidly, has helped the operator and the designer of electrical machinery and apparatus to a very marked degree. It was only after the oscillograph was available that some of the hitherto obscure phenomena in electrical machinery and apparatus were explained. The oscillograph did for electrical machinery very much what the indicator did for the steam engine. More recently the cathode ray oscillograph has enabled the properties of materials to be investigated at wireless frequencies, and the "Klydonograph," when calibrated with a Dufour cathode ray oscillograph, has given much useful information on the nature and intensity of lightning storms.

The oscillograph also enabled detailed investigations to be made on Graham Bell's problem, the analysis of vowel sounds, and with the development of broadcasting and the necessity for an exact reproduction of music and the spoken word, the study of what has been called the new acoustics has again become important.

It is impossible to lay too much stress on the necessity for accurate observation of electrical quantities. It was accurate measurement by the late Lord Rayleigh and Sir William Ramsay that led to the discovery of argon and other new gases that are now being used in the construcition of gas-filled lamps. The utmost care should be taken to secure accurate results in all observations; it is notable that nearly all great discoveries have been based on effects which are relatively small. Oersted, Faraday and Thomson to whom references have already been made, would never have observed the phenomena for which they obtained world-wide fame, unless they had noticed small and insignificent effects.

It is significant that big manufacturing undertakings all over the world have now established research laboratories on a very extended scale, and that they do not confine their activities to the testing of apparatus and materials used in the factories, but employ many people who are engaged in the study of pure science. H. D. Arnold, of the Bell Laboratories, may be quoted :—"Our research problems are scattered along the whole frontier of the sciences which contribute to our interests, and extend through the fields of physical and organic chemistry, of metallurgy, of magnetism, of electrical conduction, of radiation, of electromics, of acoustics, of phonetics, of optics, of mathematics, of mechanics, and even of physiology, of pyschology and of meteorology." Manufacturers are not necessarily philanthropists. They realise that such study pays.

Training of Students.

The universities have done a great deal in the training of men who can staff such laboratories (that is one of their primary functions), and they can best do this part of their work by encouraging their students to carry on "investigations" themselves. Although a great many of the discoveries that have proved of such importance have been made in university laboratories, many of those that have been described, have been made by private investigators. It is of the utmost importance that such studies should be encouraged, and that investigation and discovery should not be hampered by lack of means.

Faraday carried out his work for the love of knowledge, and I am sure there are many research workers to-day whose chief concern is the pursuit of knowledge for its own sake; but that is no reason why they should not receive adequate material recognition.

Scientific discovery is the basis of all electrical engineering. Without it, the electrical industry would not exist. It is as necessary that it should be encouraged to-day as ever it was, for the discoveries of to-morrow may lead to as great a material revolution as did those of Faraday.

RATIONALISATION OF INDUSTRY.*

A Stage in the Evolutionary Process—Industrial Electricity as a Factor—The World's Electrical Industry Envisaged as a Single Unit.

By A. P. YOUNG, O.B.E., M.I.E.E., M.I.A.E.

IT must be realised that the rationalisation of industry now being experienced is but a stage in the continual process of industrial evolution.

The invention of the steam engine and other associated inventions relating to textile machinery gave a great impetus to the growth of factories towards the end of the eighteenth century. The evolution of industry in this country during the nineteenth century is a story in itself, and cannot be completely dissociated from political developments. At the beginning of the century this little island had a population of just over ten million, with a total of nearly 1¾ million homes. At the end of the century the population had increased to 37 000 000, and the number of homes to 7 000 000—an increase of almost exactly four times in each case.

By the end of the century it is true to say that Great Britain had become the workshop of the world, and more important still, in thus working out her industrial salvation, she had blazed the trail by the initiative skill, ability, honesty of purpose, and financial genius of her people, for the industrial developments which have, during the last few decades, permeated all other countries and made these countries her active competitors in the markets of the world.

Although little more than one quarter of the twentieth century has been travelled, it is true to say that the industrial progression achieved in this relatively short span of time is far greater—when measured by economic and human standards—than the sum total of progress made previously and since the inception of the industrial era. Four factors have contributed to this result:—

(*a*) The rapid application of the use of electrical energy for industrial purposes, which has enabled the individual worker to control more power and thus increase his productivity.

(*b*) The general speeding-up of the rate at which we have increased our knowledge of Nature's laws and materials.

(*c*) The reactionary effect of the great war.

(*d*) The growing appreciation of the supreme importance of the human factor in all industrial undertakings.

The combined effect of these four evolutionary forces has been in the direction of applying an ever-increasing concentration on the development and improvement of the power driven machine. Examples of such application are to be seen in the universal use of the motor car; the great advances made in the last decade in the design and construction of machine tools; the rapid developments in the use of machines operated by electrical energy for meeting industrial and domestic needs; the extraordinary growth of the use of machines in connection with the radio art; the evolution of the aeroplane which enables man to transport himself at a speed a little less than half the speed of sound—just to cite a few striking illustrations.

Mass Production.

As a corollary of this trend of development, it has been possible to concentrate huge industrial organisations on the manufacture of one article, segregating the manufacturing operations to such a degree that each becomes basically simple and within the capacity of the unskilled to perform successfully. By such means so-called mass production has been successfully realised, the condition of success being steady and continuous flow from mother earth to consumer, through the manufacturing machine, this in turn involving mass consumption which is brought about by ever widening the market through reduced costs, lower selling prices, and the maintenance of a high wage level.

It seems inevitable that, ultimately, the industries of the world will become internationalised. Even at the present time, industrial activity knows no boundaries; worships no particular nationality; and is all embracing in its sweep, being impelled by the basic idea of service to its customers. True, artificial barriers are erected which tend to impede the onward and all-pervading rush of industrial activity, but when studied in its broader aspect from the angle of world progress, all such artificial barriers are found to retard the rate of industrial progression, and ultimately they will, in my judgment, be swept away.

Just consider for a moment the electrical industry, and let us concentrate our attention for a moment on a large rotary converter. An analysis of this design of 1 000 kW capacity revealed that no fewer than 12 528 separate pieces were used in its construction, involving the handling of some 39 different materials. These materials have come from all over the world, and it is perfectly true to say that the effort which we are able to make in the B.T.H. Works at Rugby in manufacturing one of these machines is the terminal point, so to speak, of innumerable lines of communication which spread out all over the world, being anchored to some form of human activity at these distant points upon the efficiency of which our effort in Rugby is greatly dependent.

International Character of Industry

The international character of the industrial activity surrounding the ultimate manufacture of the converter cited as an illustration of my theme is true, in greater or lesser degree, of all forms of industrial activity, and serves to show that industrial activity and efficiency in any particular factory, town, state, or country, cannot be completely divorced and dissociated from similar activity elsewhere, but on the contrary, all these separate and distinct industrial operations are closely interconnected and dependent one on the other. Industry, therefore, knows no boundaries of country, race, or creed, but is ever flowing and all embracing, so that its onward march must tend to bind the countries and peoples of the world closer and closer together until they become a united family.

It is not difficult to conceive a state of affairs when the whole electrical industry, the world over, is interconnected and so allied so that it has become virtually a single operating industrial unit, inspired by the nobleness of the task of developing the power of usefulness of this wonderful agency, and dedicated to the proposition of utilising every means in its power to serve humanity by urging it along the path of electrical progression. The same line of evolution is possible with each of the other basic industries, so that by such means there would ultimately be established an international industrial world state, in which all those concerned with the rendering of a particular service—whether this take the form of food, electricity, clothing or transportation—are banded together as a united human team, marching forward along the path of human progress, and united in their supreme allegiance to the ideal of making this service better and better.

This conception of a future state of industry which it may take many centuries to realise, does not involve the destruction of the individual initiative of any members of the team, nor does it mean that the individuality of any particular organisation will be crushed by such a huge merging of world interests. On the contrary, anything which operates in this direction of preventing the human unit from giving free expression to its individuality and initiative, is harmful to progress, because the human factor must ever remain of supreme importance in industry. It all depends on the way in which the team spirit is made to permeate the whole human organism, and the degree to which this spirit is directed towards improving the service to which the whole human team is dedicated.

The term rationalisation is now being applied to any process of merging industries in a "horizontal direction" as distinct from a trust or combine in which the merging is "vertical," to permit the activities of the group to embrace and control the flow of materials in the industrial circuit at all stages from mother earth to consumer. Classical examples of the latter type of combination, as distinct from a rationalised industry, are the huge business conducted by Lever Brothers in this country and the wonderful organisation of Henry Ford in the United States of America.

Rationalisation is, therefore, a process of merging in which industries giving the same class of service are brought into very close and intimate association, objective to improving the efficiency of that service by the elimination of waste at all stages of the industrial processes.

(To be concluded.)

"LIGHT'S GOLDEN JUBILEE."

Sir Joseph Swan the True Inventor of the Incandescent Lamp—Some Inconsistencies in the American Claims on behalf of Edison.

By KENNETH R. SWAN.

IN view of the statements, emanating from America, giving the credit for the invention of the incandescent electric lamp to Mr. Edison, readers of THE ELECTRICIAN may like to have a brief statement of the true facts of the matter.

No doubt the world acclaims Edison as a great inventor, but it is incorrect to say that it recognises him as the founder of the electric lighting industry. Take England, for example. Does England acclaim Edison as the founder of the electric lighting industry? Clearly not, seeing that the foremost

The late Sir Joseph Swan, inventor of the incandescent electric lamp.

representative body of electricians in this country, the Institution of Electrical Engineers, on December 20th last year commemorated with fitting ceremony the invention of the incandescent electric lamp by Sir Joseph Swan, and recorded the fact that the electric lighting industry in this country, and indeed in other countries, largely owed its development to his invention. There may be other countries besides the United States which designate Edison as the founder of the electric lighting industry, but if there are, it is certainly not to be assumed that they do so rightly.

Now I think it is perfectly true that Edison is entitled to rank amongst the first and foremost who correctly formulated the conditions necessary for realising what was in those days called the "subdivision of the electric light"—namely, high resistance lamps run in parallel. I believe that in this country Lane Fox was amongst the earliest advocates of this principle.

Swan was not so much concerned with the principles of electric distribution as in devising a practical form of lamp to give a small unit of light. He was quite alive to the importance of making a lamp with a high resistance, though he did not, in the very early days of his lamp making, see the way to make a practical lamp with a resistance as high as was necessary for parallel work, as first clearly set forth by Lane Fox and then by Edison. But, as he gradually perfected his method of making filaments, he found himself able to make lamps which ran satisfactorily on a 100 V circuit suitable for wiring in parallel, and later on circuits of 200 V and higher voltages.

But the real problem which Swan set himself to solve in 1877 (resuming his earlier abortive experiments of 1860) was to devise a practical form of lamp having a durable carbon conductor as thin as possible mounted in an evacuated glass bulb. This problem Edison also set himself to solve. The system of distribution was a problem which could be solved on paper, given a suitable lamp, but the discovery of a suitable lamp to fulfil the specified conditions could only be solved by experimentation. There were at least three serious difficulties to be surmounted before a successful lamp could be made:—

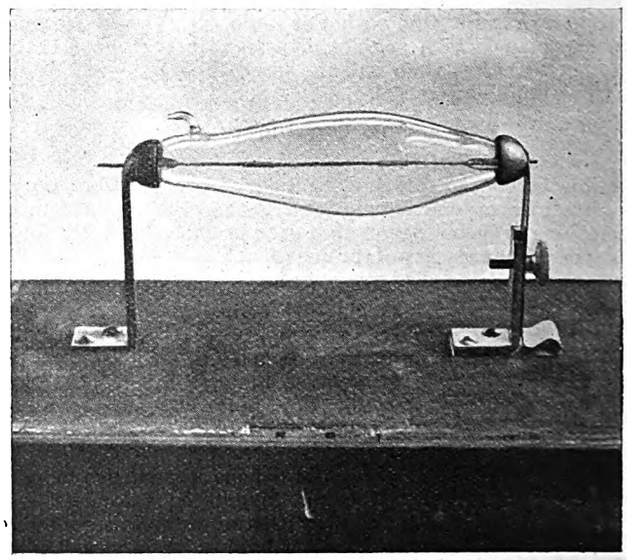
The first was to obtain and maintain a high degree of vacuum in the glass container. Swan and Stearn, during their joint experiments in 1877 and 1878, discovered that this difficulty could be surmounted by continuing to run the lamps on the pump after the filament had begun to incandesce. Edison, I believe, also discovered this means of getting rid of occluded gases when working with platinum filaments. Swan was working with carbon throughout, and his discovery of this means of improving the vacuum was, I believe, prior to Edison's similar discovery, and wholly independent of anything done by Edison.

A Formidable Difficulty.

The second difficulty, which was perhaps the fundamental crux, was the discovery of a suitable material for the filament.

The third problem was to devise means of mounting the filament so that it did not break, and of leading in the wires through the glass envelope so that the vacuum was not impaired. This difficulty, which was no inconsiderable one, was surmounted by Swan and Edison in various ways, again working on independent lines. But it was the second difficulty, the discovery of the substance from which a satisfactory filament could be constructed, which proved the most formidable; so formidable did it prove in Edison's estimation that he gave up carbon in 1878 as hopeless, and turned his attention to iridium and various alloys of iridium.

Swan was satisfied that carbon was the right material, for his early experiments in 1860 had convinced him that he was able to produce, by his special process, carbon in such a dense and elastic form as to make it eminently suitable for his purpose. In December, 1878, Swan produced a lamp which satisfied him that the problem was solved. It is true that the carbon conductor was not as thin as he could have desired, but that was a matter which he felt sure he could improve upon. Several lamps of this type were made and exhibited to large numbers of people in the following months, January and February, 1879. Whether it was because the news of this



One of Swan's original lamps which were publicly shown in 1878.

achievement reached the ears of Edison or not, I do not know, but for some reason not explained, Edison, shortly after Swan's achievement, returned to carbon as the material for

Digitized by Google

making the filament for his lamp, and, as is recorded, he succeeded in getting a lamp with carbonised cotton to glow satisfactorily for some 40 hours on October 21st, 1879.

But this lamp of Edison's was not a practical lamp; and had the matter gone no further than this the problem would have remained unsolved. Edison thereupon sought about for an alternative form of carbon conductor, and started to make filaments of carbonised paper and cardboard, just as Swan had already done in 1860. Ultimately, after a world-wide search for suitable material and the expenditure of a vast sum of money, the best material which Edison could discover for his filament was a certain species of bamboo, and the lamps exhibited at the Paris Exhibition, 1881, and the Crystal Palace Exhibition, 1882, were made with bamboo filaments. But bamboo filaments, though more satisfactory than paper, were not the solution of the problem; and the bamboo filament was soon discarded in favour of the filament which Swan had devised.

The Squirted Filament.

The difficulty in making a small surface carbon of high resistance was that if the carbon is of a strong material it has a low specific resistance, and has therefore to be made very long and thin. If a porous carbon is used, such as that from paper, bamboo, wood, etc., the specific resistance is high and the carbon is therefore reasonably short and thick, but this advantage is outbalanced by the weakness of such carbon. Edison's commercial bamboo lamps were very weak, and had to be run very dull to get any life duration, and were merely a variant of the paper which Swan had discarded for his homogeneous amyloid, which became universal.

Early in 1880, Swan, having worked continuously on the problem of obtaining a thinner and more satisfactory conductor than those used in his earliest lamps, had hit upon the idea of parchmentising a certain quality of cotton thread and carbonising it according to his particular method. In this way he formed a filament which had the desired qualities, and with this filament the earliest commercial lamps were made in England. In France and elsewhere on the Continent Swan's parchmentised cotton filament was either initially or ultimately adopted in preference to the bamboo, and I believe I am right in saying that the American manufacturers before long also adopted the parchmentised cotton filament in place of Edison's bamboo filament.

This type of filament, the parchmentised cotton filament, held the field for some nine or ten years, until it was superseded by the squirted filament, made by squirting cellulose through a fine orifice. This process was invented by Swan in 1883; and it was this process which so materially facilitated and improved the making of lamps of higher voltage and efficiency as to give an enormous stimulus to the more general use of incandescent electric lighting. Edison did not in any way contribute to these vital improvements in the carbon filament, though I observe that in the "Life of Edison," written by G. S. Bryan, Edison is credited with the invention of the squirted filament (see pages 137–138), where it is stated:

"In the meantime, however, Edison had been developing an artificial filament—a 'squirted' filament, as it was termed. A soluble cellulose was prepared and then forced through a die, the result being a long thread that when hardened looked somewhat like catgut. The thread was cut into lengths and these could be formed into desired shapes. After this material was carbonised at a high temperature (the higher the better) the carbon residue was found to be both extremely dense and highly elastic. Gradually the new process was adopted for the commercial production of lamps."

This is only one of the many instances in which the history of the incandescent lamp has been garbled by false attribution.

In the above summary I think I have correctly set forth the respective contributions of Sir Joseph Swan and Thomas Edison to the solution of the problem of making a practical incandescent lamp. But it is also important to observe this fact, that the practical manufacture of the incandescent carbon filament lamp in this country does not owe one iota to the work of Edison. It was initiated and developed entirely without assistance from Edison's experiments, so that, quite apart from the question of priority of date in the invention of the incandescent carbon filament lamp (as to which I think Swan clearly has the stronger claim), the initiation and establishment of the manufacture of the incandescent electric lamp in this country was based not on Edison's work but on Swan's.

How then, can it be truly said that "the world rightly designates Thomas Alva Edison as the founder of the electric lighting industry"?

THE EVOLUTION OF A PERFECT TOTALISATOR.

A Triumph for British Electrical Manufacturing Enterprise.

By a SPECIAL CORRESPONDENT.

BEHIND the recent letter to the Jockey Club from Sir Clement Hindley, chairman of the Racecourse Betting Control Board, there is a story of which the British electrical industry has much cause to be proud. It bears out once again the old story that when it comes to doing what seems to be impossible, the British manufacturer just gets down to the job and does it.

Before it is possible to appreciate the exact nature of the problem which the Racecourse Betting Control Board set before the electrical industry, it is necessary to understand the problems which confronted Sir Clement Hindley and his colleagues on the Board in this task of installing totalisators on English and Scottish racecourses.

In every country where the totalisator—either in its fully mechanised form or in its partially mechanised form where hand selling and an indicator work together—has been in operation, there is some form of centralised racing. That is to say, there are a number of racecourses, located conveniently near big centres, where on 30, 40 or 50 days in each year racing takes place either on the flat or "over the sticks." At such meetings it is possible to instal a permanent form of totalisator—a sort of factory, as it were, in which all the machinery is immobile, and the working parts, once fixed into their proper positions, remain there year in, year out.

Vigorous efforts to persuade the Racecourse Betting Control Board to adopt this type of installation on the majority of the larger flat racecourses here were doomed to failure from the outset, because the cost of such immobile installations was prohibitive in view of the fact that much costly machinery would be lying idle from 355 to 360 days a year on the majority of our racecourses. There are only six or seven racing days a year on the majority of the courses, and only two or three days on which really large attendances can be expected.

Thus, the problem laid before the British electrical industry was the evolution of an efficient totalisator, the integral working parts of which would be portable. Portability means that the working parts can be dismantled conveniently at the end of a given race meeting, transported to the next fixture and re-erected there in a short space of time. It must allow this procedure to be continued indefinitely so that the same equipment may cover a series of important meetings, year after year, and thus become a comparatively light charge on the totalisator fund.

The fully mechanised tote is a ticket selling machine which records automatically on the electrical indicator each unit (2s. is the agreed unit) as it is sold. There may be two indicators in different rings, and the sales all over the course must be shown simultaneously on each. There are two "pools"—one for win and one for place—on each race, and the tote must show the position of each pool up to the moment the starter releases the gate and the horses are off.

The perfect synchronisation of the indicators has been one of the toughest nuts to crack, and it is very gratifying to find that this point has been dealt with, in common with the other details required by the specification.

In the course of his letter, Sir Clement Hindley wrote:—

"The type of indicator adopted, while there are differences of detail in the articles designed by the three contractors, is generally similar to that already seen in use at many of the courses where totalisators of the simple form have been operated, namely, at Carlisle, Catterick, Folkestone, Gatwick, Lanark, Ayr, Hamilton Park, Chepstow, Thirsk and Haydock Park. It shows the figures by means of electric lights, and the Board considers it a distinct advance on any system of indication previously adopted, by reason of its great range of visibility, and its portability. The figures can be read up to a distance of over 500 ft. in bright sunlight; and, as an instance of portability, I may mention that recently one set of equipment of this type did duty at Ayr on September 18th, 19th, and 20th; at Hamilton Park on September 30th, and

Digitized by Google

October 1st, and at Haydock Park on October 11th and 12th. The adding machinery which has been evolved in a portable shape consists of different adaptions of apparatus in common use in automatic telephony, which has proved its reliability in many countries. The different firms of contractors have used different methods, but in each case are working to the Board's requirements, the Graham Amplion Co. working with the General Electric Co., the British Automatic Totalisator Co. working with Messrs. Ericssons, and the British Thomson-Houston Co. working with the Automatic Telephone Manufacturing Co., are now putting the final touches to the evolution of apparatus suitable to our requirements, in close consultation with our experts. And, in addition, we are taking the advice of one of the most eminent firms of consulting electrical engineers in the country."

It is hoped that a working demonstration of the new apparatus will be available on a racecourse in London before the end of the year, and there is no doubt that keen public interest will be raised in the efforts put forward by so many important undertakings associated with the electrical industry.

E.P.E.A. DINNER.

Mr. Frank Hodges on the Overhead Line Opposition.

THE annual dinner of the Southern Section of the Electrical Power Engineers' Association, held at the Hotel Cecil, London, on October 19th, attracted some 500 members and guests, including Sir T. F. Purves, who made his first appearance as President of the Institution of Electrical Engineers. Mr. E. Rendell Ingram was in the chair.

Mr. FRANK HODGES, in proposing the toast of "The Association," remarked that most of the chief engineers in the country had graduated through the E.P.E.A., and he was proud to be associated with an industry in which grit and perseverance were suitably rewarded.

Referring to the agitation against the erection of the Central Board's overhead lines on the Sussex Downs and elsewhere, Mr. Hodges said that while there were, undoubtedly, a number of people and organisations who were deeply concerned to protect as far as possible in our industrial island the beauties and amenities of our countryside, there were others who were making a brazen effort to preserve their own selfish interests at the expense of the improvement in the standard of life of the industrial and rural population.

Not only were such people selfish to a degree, but they endeavoured to set up a code of conduct for themselves which they would publicly declare as reprehensible in the working classes if the latter adopted it.

They were trying to get behind the findings of the Minister of Transport, who had arrived at a decision with respect to the establishment of the high tension transmission lines along the downs, after setting in motion all the judicial procedure for hearing all evidence, for and against, at a public court, in accordance with an Act of Parliament agreed to by all parties.

If the working classes had endeavoured to break the law, or contravened an agreement, their conduct would have been described as dastardly and unpatriotic, and we should have heard much piteous wailing about the inability of the workers to accept the findings of a Court of Arbitration.

The industrial community would certainly resist the efforts of the rich, who had made their money out of the industrial community, and who had the good fortune to live sometimes in our beautiful and sequestered countryside, to prevent the rural population surrounding them from having the full advantages of modern electricity development.

Working Classes and Cost.

The working classes, he said, would never agree to the additional, almost fabulous, cost that the Board would be put to if the schemes of these protestors were adopted in the countryside, for every pound needlessly expended in putting cable underground to preserve rural amenities meant that the industrial worker, who rarely ever had the opportunity of visiting these beauties, had to pay dearer for his electricity, and was deprived of the opportunity of having even those smaller amenities in his industrial life which were absolutely essential to his physical existence.

With regard to the outcry against the erection of the Battersea power station, the question might be asked, "Do we want sheep grazing on the Embankment, or do we want livelihood and health-giving industries along the river banks?"

The industrialist, both employer and workman, had not yet raised his voice against being taxed for the benefit of a rural brother, in the effort to provide him with his electrical amenities. But he was gradually being provoked into definite hostility by the action of those who, for utterly selfish ends, not only imposed a burden upon the town dweller and industrial worker, but whose efforts condemned the agricultural population to continuous drudgery and to a state of backwardness as compared with the agricultural population in other countries in the world. At present the Sussex Downs were meaningless to millions of our population because under existing conditions they could never go there.

Employment Problems.

Mr. T. D. MARTIN, the president of the Association, referred to the low efficiency of present methods of generating electricity and wondered whether, in spite of the developments that had been made, we had progressed very far since a Chinese burned his house to make roast pork. Referring to the Whitley scheme, Mr. Martin was convinced of its great success in the electrical industry, and as evidence of this it might be mentioned that it had only once been necessary to take a case to arbitration. To the E.P.E.A. the coming of the Central Board meant fewer generating stations. On the other hand, more staffs would be required on the distribution side. During the transitional stage employment difficulties would arise, but this aspect was being dealt with by a displacement committee.

The toast of "Our Guests" was proposed by Mr. E. Rendell Ingram and replied to by Mr. F. W. Purse, chief engineer to the London and Home Counties Joint Electricity Authority.

Some of the members of the Electrical Power Engineers' Association and their guests at the E.P.E.A. Southern Division dinner at the Hotel Cecil, London, last Saturday. The speeches, reported above, included a striking criticism by Mr. Frank Hodges of the critics of the Central Board's overhead line projects.

PERSONAL SALESMANSHIP.

Its Application to the Electrical Industry—Dullness and Showroom Service—The Art of Reception.

"PERSONAL Salesmanship in the Electrical Industry" was the title of the lecture given by Miss Gladys Burlton at the first E.D.A. Salesmanship Conference, at the Royal Society of Arts, on October 18th. Sir Andrew Duncan (chairman of the Central Electricity Board) presided.

Miss Burlton said that if she were asked what was the chief fault in the service of the electrical showrooms she had visited, she would say dullness. The people were extraordinarily dull. She was never once thrilled or excited in any of the showrooms; she was depressed when she went in and was more depressed when she came out.

The essential fundamental in successful salesmanship was to be able to like the customers, to make each and every customer feel that they were the very person the salesman had been waiting for for years and that here at long last that customer had arrived. Nothing like that, however, seemed to happen in the electrical showrooms she had visited. The people there seemed to bear her entry with fortitude. They did not seem to be in the least moved, and in most cases her presence was not even acknowledged from beginning to end. The reason why there was so much unsuccessful selling in what might be termed a technical industry was that technical experts generally hated people. Scientists generally disliked their fellow-beings, and that made them bad salesmen. Therefore, unless a person was able to like people—the nasty people as well as the nice people—he or she should keep away from the selling business.

Therefore, the first thing for the industry to cultivate was the art of receiving people. She had been received in a showroom on the previous day by a commissionaire, and when she asked to see some fires, he said, "Oh," and went away. She had, she continued, come across several cases in which there had been no very intelligent method of making contact with the prospective customer. The juniors were not trained; they did not know what to say and were nervous. They were told by the customer what was wanted, and then fetched somebody else to whom the story had to be told all over again.

Personality.

She felt it necessary to emphasise the point that if a salesman liked a customer it was as well to show it. One salesman she came across seemed so miserable that she suggested to the manager that he looked as if he contemplated suicide. The manager, however, said he was the best salesman he had, and was very nice underneath. She found out that that was so, and felt tempted to place a placard on him, "I am very nice underneath." How could anybody know you are nice, asked Miss Burlton, if you did not show it?

After discussing the "art" of keeping people waiting, and the annoyance to a customer when the salesman is called away to the telephone, Miss Burlton spoke of the importance of knowledge on the part of the salesman of the article he is selling, and mentioned that one or two assistants in electrical showrooms she had visited were extraordinarily vague, and only too thankful to hand her over to somebody of more experience. She had been wondering what methods were adopted of training the junior staffs, and had a sort of feeling that there was no method at all, or that there was something wrong with the method. It seemed to her that no trouble was at present taken to teach the juniors much about the apparatus in the showrooms. At the same time, the less technical the salesman could be the better.

Detailing the general essentials of selling, Miss Burlton placed first the ability to like people; secondly, a knowledge of the goods being dealt in; and thirdly, skill in talking and demonstrating.

The CHAIRMAN, in asking for discussion, said he felt very disposed to ask Miss Burlton to go down to the South Downs and try and sell wayleaves, and if she were successful he would ask her to go to the Lake District.

Councillor WATT pointed out that electric cooking, for instance, was an entirely new method of cooking, and it must be explained more or less scientifically. Only in that way could the consumer be educated.

Mr. ROBINS said he could understand an assistant in a showroom not knowing the voltage in any particular case, because in his district there were four voltages.

Mr. CONEY agreed with Miss Burlton that there are a very large majority of customers who know nothing of electricity, and are not in a position to understand technical descriptions by the salesmen.

Mr. HOWELL commented on the high qualifications laid down by the lecturer for a salesman in an electricity supply showroom, and yet, he said, most undertakings expected to get people with those attainments for about the same salary as that paid to the municipal dustman.

Mr. JACKSON suggested that some supply authorities do not encourage salesmanship. Some even said they did not want the cooking load, and the sales staff did not get the encouragement they should have. He knew of one very enthusiastic salesman who was having the heart knocked out of him by the attitude of the management.

Electrical Showroom Atmosphere.

Miss C. HASLETT remarked that the electrical showroom had a totally different atmosphere from that of the ordinary commercial shops. Women were brought up with some knowledge of hats and clothes and furniture and fabrics, and they knew something about them when they went into a shop. That was not the case, however, with electricity and electrical apparatus, in connection with which they suffered from an inferiority complex. Therefore the problem of serving a customer in an electrical showroom was a very peculiar one and did not bear any resemblance to ordinary kinds of salesmanship. She would very much like Miss Burlton to spend a considerable time in an electrical showroom and then come and give her experience. In her view, continued Miss Haslett, the electrical industry was not taking sufficiently seriously the problem of training juniors. The Electrical Association for Women was constantly being asked for women demonstrators, but the available supplies of trained people had been exhausted. Therefore it was essential to take in hand very seriously the training of juniors to fill positions as saleswomen and demonstrators, otherwise the industry would be up against a very serious problem.

Mr. HAYES also complained of the lack of training facilities and opportunities for juniors. The general policy, he said, was to keep the staff down to such a minimum that there was little margin for illness and even holidays. On the question of salaries, he claimed that, for the technical qualifications now demanded of sales people, higher salaries should be paid, and urged those engaged in this work to hold the big idea and demand higher salaries.

Mr. MORRIS, speaking as a contractor, said it was very difficult for the average contractor to have a large number of assistants, although he agreed that the assistants that were employed should be well paid.

A Suggestion.

At the conclusion of the discussion, the CHAIRMAN, proposing a vote of thanks to Miss Burlton, said that he had visited a good many showrooms in this country, and some of the more recently erected ones were very expensive and admirable buildings. He always asked the question, when he went into a new showroom, where the complaints room was. He usually got the answer, "We do not have complaints," and in such cases he knew precisely what to think. In another country, recently, he saw a most interesting illustration of how he thought a sales department should be run. The best room on the ground floor was set aside for receiving inquiries or complaints, and these people were attended to by the best salesman on the staff. On an upper floor there was a large room in which there were, according to conditions, from 24 to 48 telephonists receiving telephone calls from consumers. That was what he called sales organisation. That particular undertaking, of course, was a very large one, and there was room for such a sales organisation. He would not suggest that a similar organisation was possible with smaller undertakings, but it occurred to him that the E.D.A. might spend a profitable evening in having a general discussion on the organisation of sales departments.

Miss BURLTON, replying to the discussion, said she was perfectly well aware, as Miss Haslett had said, that she would have been more useful had she known more about the electrical industry. Undoubtedly the proper staffing of a showroom was an important matter, and she hoped the representatives of managements who were present would take notice of what had been said.

GERMANY AND FOREIGN CAPITAL.

Herr C. F. von Siemens Criticises Foreign Control Policy.

THE following extracts from a translation of an article in the "Berliner Tageblatt" of October 13th indicate the development of a controversy which recently aroused considerable attention in electrical and public circles in this country:—

"The transaction reported in yesterday's morning papers by which the controlling majority of the Mix and Genest Co. and of the South German Telephone, Cable and Wire Co., with the F. Schuchardt Co., all belonging directly or indirectly to the A.E.G. concern, should be combined in a holding company under the control of the American International Telephone and Telegraph Co., has provoked the Siemens Co. to a quite unusual attack on German companies, as they evidently feel this combination to be directed against their interests.

"Dr. C. F. von Siemens, the chairman of the Siemens and Halske Co. took the occasion of an internal celebration of the Siemens groups of the 82nd anniversary of their foundation, to make a speech which was openly directed against the capital policy of the A.E.G., the largest German competitor of the Siemens group. After referring to the development of the German pre-war electrical industry, and particularly the leading part the Siemens Co. took in this development, Herr von Siemens said:—

"'It seems to me that many leaders of the once so proud electrical industry have too soon relinquished the wheel and called the foreign pilot, because they did not think it possible to master the tempest by themselves. They fell under the spell of the fatalism so frequent in the present day. They did not make the work easier for those who hoped with their own strength and with their own crew to recover the proper course, and to keep a German ship in the leading line in competition with foreign nations.

"'The foreign pilot, even if he is only standing next to the German helmsman in a consulting capacity, will not and cannot give his advice with the strong feeling of common interest between leaders and crew. How much less so if the pilot is not only pilot, but is, in addition, navigating ships of his own under the flag of his own country in competition with German enterprise. He will use his German captains as assistants for the will of foreign countries. What he considers undesirable or what is opposed to his orders or interferes with his plans will be kept down with German support.

"'As the economic conditions in Germany have been developing, we are unfortunately no longer in a position to obtain the necessary means for the development of a growing industry from our own German sources. We must get the assistance of foreign gold created by German labour. We all know that this foreign gold waits for the moment when it can get the supreme control of large enterprises which hitherto have given us orders.'

Foreign Influence.

"These sentences follow logically a short but very dramatic scene created by Dr. Sempell, a member of the board of the United Steel Works, and as such also a member of the Siemens board, at the meeting of the Association of German Industry. He pointed out, without mentioning the names of the A.E.G. and Osram that he considered a preponderating foreign influence damaging German industry to be already existing if only a large minority of shares was placed in foreign hands and if the representation on the boards in such cases was not sufficiently balanced in favour of German capitalists.

"Nobody knows what the arrangements will be for the new holding company, particularly the American International Telephone and Telegraph Co., who control the majority of that holding company, and what technical compensations they will offer to the new enterprise in addition to the assistance with capital.

"We cannot imagine that only fear of competition intensified by technical and capital assistance has caused the unusual procedure of the Siemens Works. Some national idealism may also be involved, perhaps also the disappointment that it has not been found possible to unite the two large German electrical concerns in some way and strengthen their position in foreign countries.

"There were times when certain attempts were made to bring about such an arrangement. Was the A.E.G. to blame at the time that such an arrangement failed, or is the Siemens concern responsible for the failure of an arrangement which was many times expected and predicted by the Stock Exchange? The development has gone other ways, and the two electrical groups face each other in a fighting attitude such as has never been expressed previously in such a clear way.

"This position is not altered by the fact that in some enterprises both companies are co-operating, such as, for instance, in the Osram Co., in which apparently the Siemens Group as a large shareholder has not objected to a participation of the American General Electric, if only to the extent of 15%.

"It will be interesting to see how the fight will continue, and what its effect will be both in the electrical industry and in the economic field generally."

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

"Sound Recording."

[To the Editor.]

SIR,—Is not the so-called Blattner system of electro-magnetic recording and reproduction really originally due to Poulsen?

In Copenhagen, many years ago, I was shown by the latter an apparatus exactly similar to that described. It worked exceedingly well, being extraordinarily clear, if not very loud; but obviously the loudness could easily be increased by amplification.—I am, etc.,

A. A. Campbell Swinton.

London, S.W.1.
October 16th.

"Control of Ships' Auxiliaries."

[To the Editor.]

SIR,—A portion of the correspondence in your issue of October 11th, entitled "Control of Ships' Auxiliaries," has been brought to my notice, and I regret having delayed my reply owing to my absence on the Continent.

There seems to have been a little confusion in the minds of the Brookhirst Switchgear Co., which is partly my fault. The point that I was trying to stress in the particular portion of my article which caught their attention, was the advantage of controlling auxiliary motors actually on the motors themselves, with a push button; I was, of course, aware that controls for motors had been fitted for some time in convenient parts of the engine room near the motors.

I am entirely in agreement with your correspondents that the general practice is still to control each auxiliary motor by means of a separate hand operated starting panel, but I have been trying in several of my articles recently, to stress the advantage of actually being able to control each motor on the motor itself; and that is why the "Uni-Start" system of your clients has appealed so strongly to me.

The particular ships which I had in mind at the time I wrote my article were the new motorships of the Netherland S/S Co., in which, partly no doubt owing to the co-operation of your correspondents, the electrical technique struck me as being of a particularly high order.

Control of individual motors at the motor itself is still a comparative rarity, though it should be remembered that it was first tried out on Henry Ford's motorship "East Indian," and that a great deal of all that is most advanced in marine electrical technique still comes from the other side of the Atlantic.

One of the most up-to-date and practical switchboards that I have seen on a modern motorship was on the Dutch motorliner "Christaan Huygens." This, incidentally, was a switchboard which incorporated starting panels made by your correspondents.—I am, etc.,

A. C. Hardy.

London, E.C.
October 21st.

"Our House in Order."

[To the Editor].

SIR,—I have read the earnest and interesting article by Mr. T. C. Gilbert, and its seeking-for-a-way spirit and its leaning to what "this one says" and "that one says" somehow set me thinking of the tinker of Bedford. (The reference, of course, is not to any of the local contractors.)

Mr. Gilbert pictures the installation industry as still at the "What shall I do? What shall I do?" stage. Now, we have been nigh 50 years on our pilgrimage, and got on a bit further surely than that.

Our band of contractor pilgrims is a bit of a rabble perhaps. We have our Mr. Pliable, our Mr. Obstinate, and our Mr. Ignorance, with their sons and nephews in the ranks still, but also we have our Greathearts and Hopefuls. The ladies are now joining our band and The Electrician is helping us on.

We, who have travelled so far, have still some of the despondency and mire of our struggles on us, and know well that there is a difficult and dangerous road ahead. But, thank goodness, there is still a road, and the lions which we see in front have, we shall find when we get up to them, their own hidden chains, At least that has been our former experience.

Digitized by Google

Does Mr. Gilbert picture the Contractors' Paradise as the time when we, the self-elected monopolists of installation knowledge, shall flourish like a solitary licensed victualler in a busy seaport? No rules, no inspectors, nothing but orders, commissions and cheques?

We might possibly attain to this ideal, even out of present conditions, if we had that contractor Mussolini, gave him a starting refresher of £10 000 a year, and control of the castor oil bottle. But after all, it is probably better fun being one of many harassed contractors than one of the few who would reach such a temporary and uninspiring paradise, and lots of us would fall by the kerbstones.

Part of the charm of our work, and indeed our strength as contractors, is its—and our—infinite variety. We are well in among the people. Our workmanship is established in the mansions of the rich and our tough rubber is buried in the plaster of the cottage. We know where the fuseboards are and the lurking places of the battery boxes. Let us hang on to our knowledge, add to it, lengthen it, broaden it, deepen it. Let us be real craftsmen with pride in our up-to-date work, and as individuals, give individual consideration to our clients' property.

Mr. Gilbert correctly emphasises the vital importance of workmanship. Our apprenticeship system, if the ideals of our particular shop are right, can do more to foster good craftsmanship than can any atmosphere of municipal jobbery.

I can sympathise with the mood in which Mr. Gilbert has his good grouse at the conditions of our industry. Nearly every week I do it myself. At the same time I more and more realise that my business and our business are pretty much what we have made them. It is laziness and inertia that is keeping us back. If we perish it is our own fault.

As an industry we have tremendous power if we would only use it. We have great weapons in the National Register and the Electrical Contractors' Association. A few contractors give much time to these agencies for improvement, but their efforts are greatly discounted by the criminal apathy of the majority.

Mr. Gilbert asserts that contractors would respond with alacrity to any clear-cut policy definitely formulated. Well, I would answer that the clear-cut policy is "work for the industry" and its definite form must be adapted to the conditions of the moment. Now then for the alacrity!

The N.R.E.I.C. and the E.C.A. should reflect all our difficulties and aspirations. If three quarters of the total membership took active part in the work of these bodies nothing could stop our progress.

It is not enough to send along an annual pittance and expect miraculous affluence to come out of a group of initials. As engineers we might know that we are likely to get less out of anything than we put in. But if, instead of leaving the effort to the few, we all put our energies and brains into our trade organisations, our reward would be sure and our established position certain. No house can be in order when some of the inmates only sit and grumble at the rent; and the bulk do not trouble even to do that. Really they would be better with a corporation job.

Perhaps I have been too vague for Mr. Gilbert, so I will say definitely, as my own opinion, that we are making some progress towards bringing districts into line with regard to good wiring practice. When the ground has been further prepared we shall get the set of generally acceptable rules we require. When we work to rules it logically follows that inspection is necessary, and it seems to me right that the insurance people, who are paid to take life and property risks, should provide the salaries of inspectors, perhaps conjointly with the National Register, the main *raison d'être* of the latter being the protection of the public.—I am, etc.,

DONALD SMEATON MUNRO.

Edinburgh,
October 21st.

[TO THE EDITOR.]

SIR,—I was very interested in Mr. T. C. Gilbert's excellent article "Our House in Order" in the current issue of THE ELECTRICIAN, and am entirely in agreement with the author and Mr. Morris that the need in the contracting branch of the trade is compulsory registration. I also consider it desirable to have compulsory licensing of wiremen, and H.M. Inspectors of Domestic Electrical Installations.

Compulsory registration is needed to protect the whole trade in general, and the legitimate contractor and efficient workman in particular. It would also protect the general public from the dangers of fire, shocks and burns which are always present wherever installations are carried out by the "jerry" contractor with semi-skilled labour. Compulsory registration would *not* give registered contractors a monopoly, because all good and efficient contractors, some of whom consider the voluntary register worthless, would apply for registration. We should then have more than enough to ensure wholesome competition.

Compulsory licensing of wiremen is also needed to protect the wireman, the contractor and the general public. There is a certain quantity of work which *must* be done either by efficient or non-efficient workmen. If the semi-skilled man is relegated to his proper sphere, it is to the benefit not only of the skilled workman, but to the general public and what is really far more important, the danger of using electricity in the farm and home would be reduced to a minimum. The contractor would also be insured against rival cheap-jack firms cutting him on labour by employing semi-skilled and boy-labour at wages less than the trade union rate.

H.M. Inspectors of Domestic Electrical Installations are needed to keep a check on the contractor who is likely to do inferior work. Although Mr. Morris is of the opinion that to do this it would require an inspector to sit on every job, and no doubt to inspect thoroughly such a thing is necessary, it is, of course, impracticable. All electrical work, whether executed by the supply authority, contractor or anyone else, should be inspected before connection to the mains, by a Government Inspector who could demand a thorough inspection of the installation (floor boards taken up, etc.). This would very largely foot the bill, and would give an independent expert opinion as to whether the work was satisfactorily done or not. If we can have H.M. Inspectors of Mines, and H.M. Inspectors of Factories, etc., why not H.M. Inspectors of Electrical Installations?

Living, as I do, in the heart of a mining district with several relations employed in coal mines, I am conversant with the danger of their calling. The miner is protected by H.M. Mine Inspectors from injury whilst at work, but upon his return home is exposed to endless risks of shock if his house has been wired by one of these cheap "plumtricians."—I am, etc.,

W. J. RHODES.

Pilsley, near Chesterfield.
October 21st.

[Other letters on this subject are unavoidably held over.—ED.]

Capital Urgently Wanted.

[TO THE EDITOR.]

SIR,—The Electrical Trades Benevolent Institution is sadly in need of additional capital, and I earnestly appeal to everyor e connected with our great industry to assist in bringing the amount up to a minimum of £50 000. The present fund, £37 000, is wholly inadequate to meet the rapidly growing volume of claims. The number of grants made has increased sixfold during the last four years and now exceeds one per day.

Every possible effort is being made to place the fund upon a wider base of small annual subscriptions from the class which derives most benefit from the Institution, but for many years to come this source of income cannot be expected to do more than meet the immediate claims for relief of temporary distress, and the more serious necessity for pensions in cases of permanent disablement must remain unprovided for if our capital fund is not greatly increased.

There are at present on the books totally incapacitated claimants drawing small temporary relief, renewed from time to time, who could, if blessed with a small pension, retire to the country to spend their remaining days in comfort and at less expense.

Every year hundreds of good-hearted people help the institution with their donations. To these I do most earnestly appeal to reconsider the amount of their donation in the light of their own position in the industry and remembering the vast army who when they fall upon evil days have a claim upon our benevolence. The majority of these people are earning little more than a living wage and cannot provide the necessary capital themselves.

Many employers subscribe large sums for the assistance and superannuation of their own staff—a splendid solution of much of our difficulty, but this does not help the employees of innumerable small firms and many large ones which have no such provision. At one time or another we do business with and make profit by all these people, so that although, no doubt, charity begins at home, we still have a responsibility towards others. I appeal, then, to those who are so generous to their

Digitized by Google

own staff not to harden their hearts to the cry of the multitude without.

We are particularly wanting ten donors of £500 each to take up the ten vacant vice-presidencies of the Institution. Several gentlemen have already offered to do this, and I shall be very glad to hear from any reader of THE ELECTRICIAN who will come forward and do likewise.

We are also wanting fifty donors of £100 to take up life governorships. There are a great many who can afford this sum, and I am most anxious to get in touch with these to explain the great assistance this help will be at the present time.

The subscription for life membership is £10. Cheques for this or any amount larger or smaller will be most gratefully received.

A recent ruling has made it clear that gifts to the Institution will be added to previous gifts to qualify the donor for a life governorship or vice-presidency.

Full details of the Institution, with particulars of receipts and distribution, will be forwarded at once upon application.

Will readers please address donations to the Secretary, Electrical Trades' Benevolent Institution, 9, Southampton Street, Holborn, W.C.2, the Editor of THE ELECTRICIAN, or to the undersigned at 40, Hatton Garden, London, E.C.1.—I am, etc.,

London, October 16th. H. MARRYAT.

"Cooker Hot Plates."

[TO THE EDITOR.]

SIR,—I read with very great interest Mr. McRae's letter in your October 18th issue, as it undoubtedly raises the most important point in connection with electric cookers.

As manufacturer of a range of electric cooking utensils which increase the electric cooker efficiency anything between 50% to 200%, I find a remarkable amount of apathy among engineers. Not only do they entirely neglect the whole subject, but they actually go out of their way to ridicule and criticise scientific construction of electric cooking utensils upon which have been sunk thousands of pounds of capital.

The new totally-enclosed surface plates have revolutionised electric cookers and brought them within the reach of the million as an efficient cooking stove. They are, however, being rejected by the public, in some cases due to excessive current bills. Why not examine the cause, which is undoubtedly due to the use of light weight spun saucepans and kettles, which quickly buckle and warp, resulting in increased consumption. An efficient pan or kettle must be in contact with these plates all over, and must be "buckle-proof." Most of the "totally enclosed" surface plates are machined flat, and the utensils should be the same.

Why is it that there are such high percentages of failures in this country, against those of the Continent where the failures are only 1%? It is entirely due to use of the wrong type of kettle and saucepan. The public are in the hands of the showroom manager for advice; he usually thinks his work finished when he has persuaded his customer to instal an electric cooker, but he forgets that efficiency and moderate current consumption are a necessary constituent of success and confidence. If current accounts are high, the electric cooker is a commercial failure, but in fact, there is no reason for it. The showroom manager is led away by the bogey that the extra cost of proper utensils will frighten his customer away, whereas in fact, they are an investment which will earn high dividends and safeguard his customer.—I am, etc.,

London, N. October 22nd. S. DAVIS NICHOLLS.

Advertising for Electrical Contractors.

[TO THE EDITOR.]

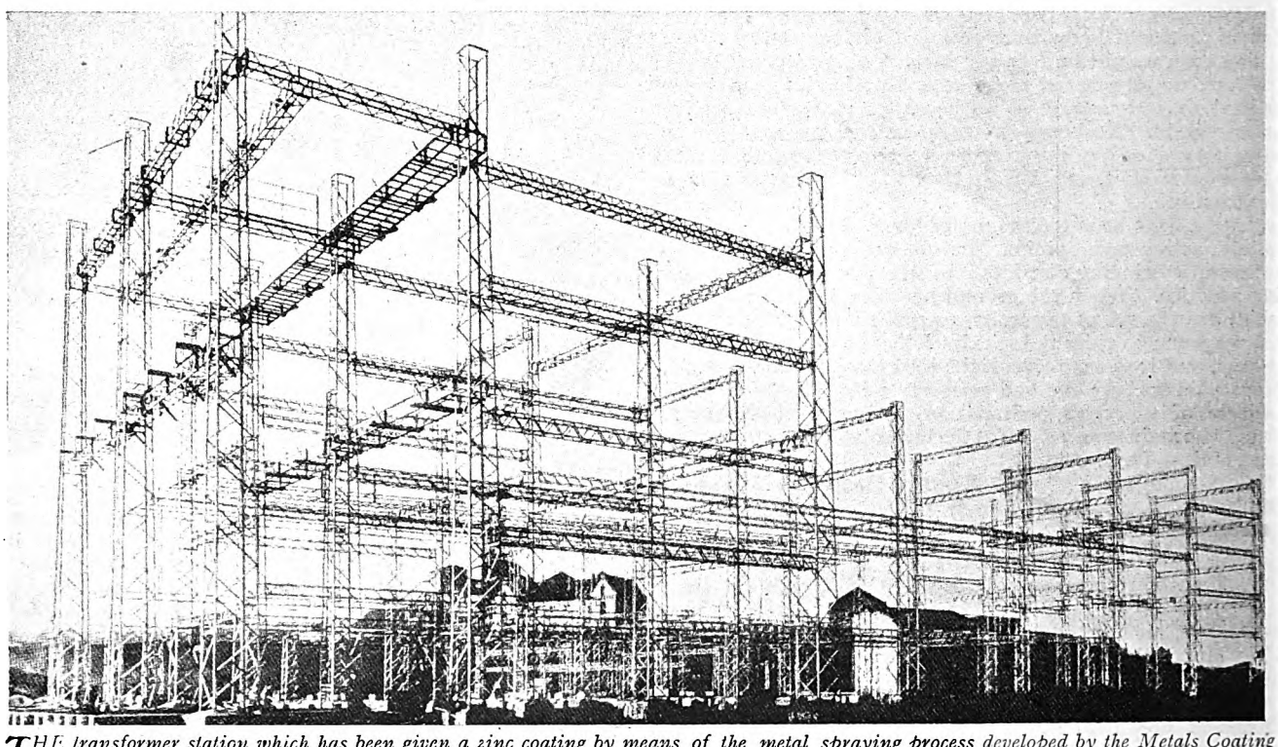
SIR,—In the article on Advertising in your issue of October 18th, "Publicity Consultant" reproduced an advertisement issued by a firm of contractors, which begins: "Safety first, Electricity may be either a treacherous or a trustworthy servant," and goes on to suggest that the average householder will be safe in the hands of the particular firm advertising.

My Council have on several occasions expressed the view that this type of advertisement is likely to discourage electrical development. It seems probable that many people will absorb the idea that they are not safe under certain conditions, while a few only will be satisfied that the advertiser is likely to keep them out of trouble.—I am, etc.,

W. A. VIGNOLES,
Director and Secretary,
British Electrical Development Association.

London, W.C.2.
October 21st.

[As the statement to which Col. Vignoles refers was not a solitary advertisement, but a page from a booklet, we cannot agree that it would discourage development. There is, we know, a sharp division of opinion as to whether we should safeguard the public by discreet warnings against the dangers of shoddy workmanship or treat consumers as children and hope for the best.—ED.]



THE transformer station which has been given a zinc coating by means of the metal spraying process developed by the Metals Coating Co., Ltd. It is claimed that the steel framework will be protected for about 15 years. Since it was unnecessary to provide for corrosion losses, comparatively light steel was used, and it is claimed that the saving in steel alone practically paid for the coating process. The various members are coated before assembly, and then, after erection, the work is completed by coating the rivets.

NEWS IN BRIEF.

Extension of Croydon Electricity Works—Irish Hospital Lighting—Wireless Communication with Lifeboats—Rural Supplies in Holland—Electrical Equipment for Baths—Metropolitan Asylums Board's Electrical Requirements.

ELECTRIC lighting is to be adopted in the church at Easebourne, at a cost of £275.

Croydon Electricity Committee recently accepted a tender amounting to £20 900 for extensions at the power station.

Amongst the imports to Nicaragua in 1928 were included electrical goods valued at 119 935 cordobas (equal to U.S.A. dollars) from the U.S.A. and Germany.

The managing committee of the Limerick Mental Hospital has decided to invite tenders for lighting the institution electrically. The estimated cost is £2 500.

At a meeting of the Television Society on November 5th, at the Engineers' Club, London, Mr. F. Langford-Smith will deliver a lecture entitled "Amplification and Television."

Consumers at Sydney, N.S.W., who suspect their electrical installations of being defective may now have them examined by one of the Council's engineers by making a request to the Electricity Department.

Electric lighting is to be adapted at the Parish Church, Greenhithe, Kent.

Glasgow Health Committee recommends X-ray apparatus at Meanskirk sanatorium, at a cost of £1 955.

Reigate Board of Guardians has authorised an electric light installation in a portion of the institution, and in the Board-room, etc.

Dundee Electricity Committee has accepted a British tender for cables, valued at £5 796, against £5 344 quoted by foreign firms.

The Postmaster-General announces that telephone communication from London has been extended to Trento, Merano, Trieste, Verona, San Remo, Parma, and Florence (Firenze).

The first lifeboat to be fitted with a wireless telephone has been formally handed over to the inhabitants of Stornoway by Captain R. L. Hamer, on behalf of the Royal National Lifeboat Institution. The new lifeboat is 51 ft. long and is propelled by two 60 H.P. engines.

Mr. J. N. Waite, city electrical engineer, Hull, reports that he is proceeding with the equipment of the temporary showrooms at the city hall, which will be available for demonstrations on the inauguration of the cooker hiring scheme. He proposes to sell fittings and apparatus, subject to a satisfactory arrangement with local contractors on the assisted wiring roll.

At the recent annual meeting of the Incorporated Municipal Electrical Association (Mid-East England Centre) it was decided to ask the Council of the Association as to the procedure to be adopted to secure just treatment for undertakings which have been refused permission to extend their generating stations and are unable to obtain supplies from municipal sources.

Sir Clement Hindley, chairman of the Racecourse Betting Control Board, states that, by means of portable mechanical equipment, upon the final designs of which contractors are now working, the Board will be able to provide fully electrical totalisators on all important and medium sized racecourses. The buildings, cabling and wiring will be permanent, but the mechanical parts of the apparatus will be transported to a particular course when required.

It is reported that the Commission for Agriculture Co-operation of the Union of Co-operative Dairy Works in North Holland will endeavour, in co-operation with the Provincial power station, to supply the machinery necessary for using electricity to as great an extent as possible on farms in a district where the current is supplied directly by the Provincial power station. The plant will be loaned and the installation work carried out free of charge by the Provincial power station.

Barnsley Electricity Committee is to improve the electricity showrooms at a cost of £270.

The New England Power Association produced 147 859 000 kWh in August, or 39% more than in August last year.

Swansea Electricity Committee has authorised the purchase of an electric vehicle battery, at an estimated cost of £200.

The $1 850 000 generating station being built by the Saskatchewan Government at Saskatoon is expected to be ready for operation by November 15th.

The output of central generating stations in Canada during August last totalled 1 444 314 000 kWh as compared with 1 410 709 000 kWh in July and with 1 313 556 000 in August, 1928.

Public baths and washhouses are to be established in Oakdale Road, Wallasey, at a cost of £16 500. The equipment will include 47 electric drying courses and electric mangles, and the whole of the other machinery will be driven electrically.

Hastings Electricity Committee has voted £775 for adapting premises at York Buildings as electricity offices.

Walton-on-Thames U.D.C. has authorised the electrical engineer to purchase further cookers up to the value of £500.

At a meeting of the Birmingham Electric Club, to-night, Friday, at 7 p.m., at the Grand Hotel, Mr. T. A. Windibanks will read a paper entitled, "Motor Users and the Frequency Change."

Gravesend electricity department's new offices and showrooms in Harmer Street, Gravesend, were opened on October 23rd by the Mayor, Councillor R. McGregor. Cooking demonstrations are being given daily.

The Metropolitan Asylums Board recommends the installation of call bell systems, at the Eastern, North-Western, Grove, Brook, Park, South-Eastern, South-Western and Southern (Upper) Hospitals (estimated cost £1 262), and at Queen Mary's Hospital for Children (£350) and the installation at the Southern Hospital of 10 electrically-driven sewing machines and adaptation of two darning machines to electric power (£235). Electric motors are to be substituted for gas engines in the industrial workshops at Darenth Training Colony and £400 has been voted for this purpose.

It is announced that, pursuant to the various agreements between the Shanghai Municipal Council and American and Foreign Power Co., Inc., and the Shanghai Power Co., signed on August 8th last, the Shanghai Power Co. has succeeded to the business of the Shanghai municipal electricity department. The following have been appointed as the executive officers of the Shanghai Power Co.: Mr. T. H. U. Aldridge, vice-president and general manager; Mr. C. S. Taylor, deputy general manager; Mr. H. Gordon Wright, secretary; and Mr. E. J. Edgar, chief engineer. Communications should be addressed, Shanghai Power Co., 17, Foochow Road, Shanghai.

According to an announcement by the Hon. J. R. Cooke, representative of the Ontario Provincial Government on the Ontario Hydro-Electric Power Commission, consideration is being given by the Commission to the transfer to municipalities in the Central Ontario hydro-electric power zone of physical assets and reserves valued at $15 000 000, as soon as these authorities have set up their own distribution systems. An underlying principle of the legislation under which the Commission was set up is that power must be supplied to each municipality at cost. The legislation in question, it is considered, contemplates that reserves built up by the Commission in respect of operations in any particular area must ultimately pass to those municipalities owning their own local system of distribution.

D

LOOKING BACKWARD.

FIFTY years ago, according to THE ELECTRICIAN *dated October 25th,* 1879:

Ten electric lights were installed on Waterloo Bridge. They were worked by a 20-light Gramme machine in two circuits.

Details were given of Edison's sewing machine motor.

Three different telephone companies were competing in Paris, viz., the Gower (magnetic), Bell and Edison, the two latter working with the microphone.

* * *

TWENTY-FIVE years ago THE ELECTRICIAN *of October 28th,* 1904, *reported that:*

Brighton's municipal telephones made a net profit of £98 7s. 7d. in six months.

Mr. P. P. Wheelwright was appointed borough electrical engineer of Blackburn.

Digitized by Google

W. E. HIGHFIELD SHIELD.

THE results of the 1929 competition for the W. E. Highfield Shield and prizes, recently held under the auspices of the A.S.E.E., were announced in our last issue, and we reproduce above portraits of (left) Mr. D. J. Williams, of Pontllanfraith, Mon., winner of the shield and first prize; (centre) Mr. E. E. Gammon, of London, winner of the second prize; and (right) Mr. F. Anderson, winner of the Associates' first prize.

PERSONAL.

CAPT. C. Jackson, manager of Oldham Tramways, has been appointed manager of Plymouth Transport Department.

Unsettled estate of the gross value of £265 689, with net personalty £254 988, was left by the late Sir J. A. Gatti, managing director of the Charing Cross Electricity Supply Co., Ltd., and a past-President of the Electrical Development Association, who died on September 14th, aged 57 years.

Mr. S. E. Monkhouse has been appointed chief assistant to the general manager of the Newcastle-upon-Tyne Electric Supply Co., Ltd. Mr. Monkhouse, who has been with the company for 25 years, has, during the past few years, acted as chief of the company's power department. Mr. E. H. E. Woodward, who has been with the company over 20 years, has been appointed technical assistant to the general manager. See page 511.

The Kelvin Medal Award of the Institution of Civil Engineers, which has this year been awarded to M. Andre Blondel, will be presented by Sir Donald Macalister of Tarbert, Principal and Vice-Chancellor of Glasgow University, in the Great Hall of the Institution of Civil Engineers, on November 5th, at 5 p.m. The French Ambassador will receive the medal on behalf of M. Blondel, whose health does not permit him to travel to London. Sir Brodie H. Henderson, President of the Institution and Chairman of the Award Committee, will take the chair.

Owing to the calls of his legal practice Mr. T. Trimnell, who has acted as solicitor and secretary of the National Register of Electrical Installation Contractors since its inception six years ago, has relinquished the secretaryship, but will continue to act in a consultative capacity. Mr. Trimnell was personally responsible for a very large part of the preliminary organising and legal work, and his enthusiasm and experience have proved invaluable in building up the National Register to the position of influence and authority which it occupies to-day. Mr. Trimnell is followed in the secretaryship of the National Register by Mr. A. Montgomery, who has had considerable experience in the electrical industry. See page 511.

Blackburn Corporation has confirmed the appointment of Mr. Wm. Arden Royle as engineer and manager of the electricity undertaking, in succession to Mr. P. P. Wheelwright, retired. There were 40 applicants for the post, and three appeared before the Electricity Committee—namely, Mr. Wm. Arden Royle, assistant engineer and manager to Sunderland electricity department; Mr. C. E. Greenhalgh, of Watford; and Mr. Irwin Shuttleworth, of Hull. Mr. Royle spent his early years at Southport, but is a native of Manchester. He is 39 years of age, and was a pupil of the Southport Electric Lighting Co., afterwards becoming assistant and chief assistant engineer to Monmouth Corporation. Subsequently he was for 7½ years with the British Westinghouse Electric and Manufacturing Co., and later was in the service of Ferranti, Ltd. In 1918 he secured a position as substation superintendent to Sunderland electricity department, and became, successively, distribution engineer, technical assistant, sales manager and assistant engineer and manager.

BUSINESS ITEMS.

NEW DISTRIBUTORS OF EDISON STORAGE BATTERIES, LTD., have now settled into permanent offices on the sixth floor instead of the temporary offices on the fourth floor, at their same address, Victoria House, Southampton Row, W.C.1.

The ENGLISH ELECTRIC CO., LTD., Queens House, Kingsway, W.C.2, has received a contract from the South Indian Railway Co. for the rolling stock required for the electrification of the Madras suburban services. The order comprises 17 three-coach articulated units, each unit consisting of three all-steel coaches, together with the necessary electrical equipment. The total value of the contract is about £170 000.

The WESTINGHOUSE BRAKE AND SAXBY SIGNAL CO., LTD., 82, York Road, King's Cross, London, N.1, has been informed that advices have been received that the United States Court has declared that the "Kuprox" rectifier is an infringement of the Grondahl patent, under which "Westinghouse" metal rectifiers are manufactured, such court also declaring the patent valid. The WESTINGHOUSE BRAKE AND SAXBY SIGNAL CO., LTD., is the owner of the British rights in such patent.

The D. P. BATTERY CO., LTD., Bakewell, advises us that in order to demonstrate the manner in which the plates in "Kathanode" bus lighting batteries retain their active material, a battery which had been in use for nearly two years on a corporation bus was opened up recently for examination, with the result that the positive plates were found to be in very good condition and the active material intact and firm. The negative plates were also in good condition, while the separators showed no signs of breaking down.

With reference to the "Ever-Ready Week" which was held from October 7th to 12th, the EVER-READY CO. (GT. BRITAIN), LTD., has awarded first prizes to Mann, Egerton and Co., Ltd., 21/23, King Street, Norwich; Pollock and Co., 222, Argyle Street, Glasgow; Mr. T. M. Kingdon, 97, High Street, Winchester; Hardy Bros., Ltd., Commercial Street, Hereford. Other prize winners are:—The Electrical Supplies Co., Cavendish Street, Chesterfield; Mr. Eric Thomson, The Electric Shop, Thirsk; Mr. R. Hazelton, Portadown; and Mr. Andrew McRobb, Aberdeen. See pages 511 and 513.

In connection with a new underground railway in Buenos Aires (Ferro Carril Central Terminal de Buenos Aires), the GENERAL ELECTRIC CO., LTD., of Magnet House, Kingsway, W.C.2, has been awarded the contract for the complete electrical equipment of the rolling stock, covering the motors and control gear for the total of 56 motor coaches. The latest type of (Oerlikon system) traction equipment will be fitted; the motors will be of the self-ventilated interpole type, arranged for field tapping, and the control will be of the unit-switch electro-pneumatic type. The G.E.C. is also supplying the equipment for the lighting and the automatic door control of the coaches. The main contractors for the rolling stock are the METROPOLITAN-CAMMELL CARRIAGE, WAGON AND FINANCE CO., by whom the contract for the electrical equipment was placed with the G.E.C.

LEGAL INTELLIGENCE.

Marconi and General Electric Companies' Agreements.

THE question of the continuance of two agreements, one between Marconi's Wireless Telegraph Co., Ltd., and the General Electric Co., Ltd., and the other between these companies and the M.O. (Marconi Osram) Valve Co., Ltd., came before Mr. Justice Eve in the Chancery Division on October 16th, on a summons taken out by the General Electric Co. to which the other companies were respondents.

Mr. Gavin Simonds, K.C., and Mr. Peel appeared for the General Electric Co., and Mr. Wilfrid Greene, K.C., and Mr. Uthwatt for the Marconi Co. The M.O. Company did not appear.

Mr. Simonds said the summons was for the purpose of having construed these agreements, and the question of construction was whether, as the General Electric Co. said, the agreements were subsisting and permanent, or whether, as the Marconi Co. said, either the agreements were for a definite term, or they had been determined. The first agreement, dated August, 1919, recited that the General Electric Co. owned a factory at Brook Green which was equipped for the manufacture of wireless valves and was used for such manufacture. The two companies agreed to form a private company for the purpose of acquiring this business. The capital of the new company was to be £100 000 subscribed for by the two companies in equal shares, and the General Electric Co. was to let the factory to the valve company for ten years at a rent of £1 400 a year, and to sell the plant, etc., for £17 000. Each company agreed with the other not to manufacture valves or to import valves for sale. The valve company was duly formed in October, 1919, and the second agreement, contemplated by the first, was entered into in November. The Marconi Co. said that the obligation of the parties under both agreements were co-terminous with the lease, but he (Mr. Simonds) contended that the term did not end with the lease.

Mr. Greene submitted that the agreement automatically came to an end on the termination of the lease. The parties could not have contemplated entering into an agreement which would last for ever. Mr. Justice Eve reserved his judgment.

Sydney Bribery Charge.

According to "The Times", a full bench of the High Court of Australia has confirmed by a majority the conviction of Babcock and Wilcox, Ltd., on a charge of having at Sydney corruptly given to Mr. Silas Young Maling, deputy general manager of the municipal Electricity Department of Sydney, £10 600 as a reward for his recommending the council to accept the company's tender for certain machinery. Mr. Justice Starke, dissenting, said that the case was suspicious, but suspicion was not proof.

It will be remembered that in December, 1928, at the Sydney Police Court, the local agent of Messrs. Babcock and Wilcox was found guilty of paying the sum of £10 600 to Mr. Maling, and the company was condemned to pay a fine of £1 000 and to recoup the Sydney City Corporation the £10 600. In March last the company's appeal against the conviction was upheld by a majority vote of the Court, and the company was acquitted of responsibility. The Crown Law Department appealed against that decision, with the result stated.

Alleged Patent Infringement.

Suit was filed last month in the U.S. District Court, Eastern District, Brooklyn, New York, against the Aerovox Manufacturing Corporation by the Dubilier Condenser Corporation, charging infringement of patent No. 1 688 478. The patent is claimed to be of value in the radio and allied industries and to cover the manufacture and use of paper condensers. This patent is equivalent to British patent 283 543.

Important Action Pending.

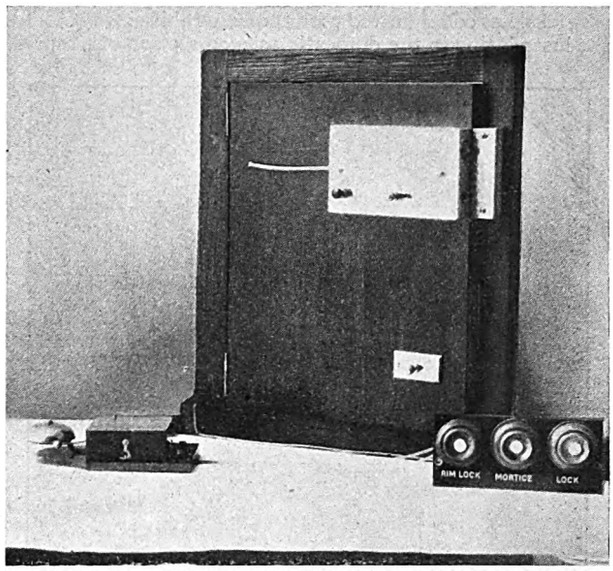
In the Chancery Division, on Monday, Mr. Tyldesley Jones, K.C., asked Mr. Justice Romer to fix a day for the hearing of an action by the Oxford Corporation against the Oxford Electric Co., Ltd. He said it was in Mr. Justice Maugham's list, but, for personal reasons, he could not hear it. He asked that it be fixed for November 12th.

It was a case in which questions arose on the construction of a purchase clause, and there was a counter-claim on which expert evidence would have to be called.

His lordship said he would have it put into the list for hearing on November 12th, subject to anything part heard.

AN ELECTRIC LOCK.

IN connection with the International Exhibition of Inventions, held in London recently, and reviewed in THE ELECTRICIAN of October 11th, it is interesting to note that the first prize in the Electrical Section was awarded to Messrs.



The locking device which was awarded the first prize of the Electrical Section of the International Exhibition of Inventions.

E. W. Porch and J. T. Knight, of 222, Dalston Lane, London, E.8.

The lock can be applied to doors, blinds, grilles, etc., and, in addition to the ordinary mechanical operation common to all locks, a remote control device permits the locking unit to be released, at the same time sounding an alarm. Where desired an indicator board may be used in connection with the lock and the alarm may be either intermittent or continuous as desired. After the summons has been answered the door or blind may be again locked either from the inside or the outside whichever is convenient or more appropriate.

The lock is operated by means of a battery and in cases where remote control can be dispensed with 2 V are sufficient for security. Where distant control is required, however, then 6 V must be applied.

The lock itself consists of a bolt held in an extended position by a lever canted by two springs arranged in such a way that any attempt at forcing the bolt causes the canting movement to become automatically tighter. When the control button is pressed from a distance the canted lever is pulled into an upright position by a small electro-magnet; the bolt is then forced back by a spring and makes contact with the alarm circuit. When operated from the door contact is made or broken as the case may be.

MANCHESTER ELECTRO-HARMONICS.

The Manchester Electro-Harmonic Society opens its eleventh season to-day, Friday. Once again the main hall of the "Manchester Limited" restaurant, Royal Exchange Building, has been engaged for the series of concerts, and the applications for membership to date promises a still further increase in the number of members. Mr. J. A. Robertson, as President, will occupy the chair on the opening night, when The "Duds" Concert Party provides the entertainment. The dates of other concerts are November 15th, December 13th, January 17th, 1930, February 21st, and March 31st. The Liverpool Electro-Harmonic Society will again visit the Manchester Society at the December meeting. A Ladies' night has been arranged for February 1st, as the experience of the last two proved their popularity and success. It might be pointed out that this function has now become an annual feature and is additional to the six monthly concerts regularly arranged for. It is intended this year to recognise in some tangible form the long and efficient service rendered by the Hon. Secretary, Mr. C. E. Leak, and the Hon. Treasurer, Mr. L. H. Marlor. A Sub-Committee has been appointed to deal with this, and it is hoped to make these presentations before the Christmas recess. Once again the balance sheet shows a good reserve on the year's working, and the Society is flourishing from all points of view.

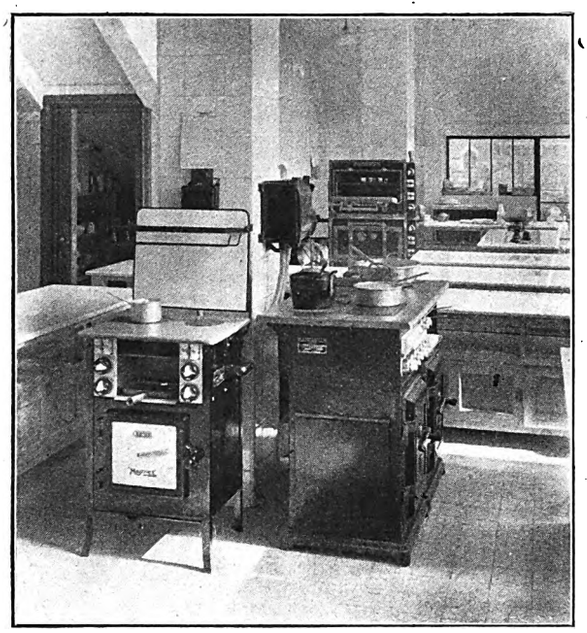
REGENT POLYTECHNIC.

Some of the Electrical Equipment in the New Extension.

FROM the earlier stages of the construction of the new extension of the Regent Street Polytechnic, which was opened on October 10th, the Director of Education (Major T. Worswick), has collaborated with the General Electric Co., Ltd. in the installation in the domestic science section of a represen-



A "Magnet" double oven range and 2-deck pastry oven in the cooking school.

tative assembly of cooking, baking and laundry apparatus. In the housewifery section for instance, is a series of demonstration cabinets staged all along one side of the room in which the working parts of ten household appliances are separately assembled and mounted and their relative functions diagrammatically explained. Similarly, batteries, electric bells, and the evolution of the gasfilled lamp are also explained. The practical application of electricity for domestic heating is demonstrated by the use of five fires of various design and loading. While the cookery lecture and demonstration theatre is filled with double oven range, a double deck baking oven, and four types of cookers, including a model de-luxe table cooker for a household of ten persons. In the laundry school, equipped by the G.E.C. throughout, the washing and wringing machine obtains the necessary hot water from an electric 10 gallon water heater alongside it, while correct methods of ironing and finishing are imparted by the use of an "Apex" electric ironer or by the more usual hand iron, several 5½ lb. and heavier laundry irons being available for this purpose. Other items included in the equipment are an electric fan and an "Eco" drying cabinet to expedite the drying of articles immediately they are released from the wringer. The restaurant kitchen premises are in the basement in immediate proximity to the sub-station of the Marylebone electricity supply undertaking, and an extensive range of heavy cooking apparatus has been installed.

SULZER BROS., 31, Bedford Square, London, W.C.1, have installed their system of thermal storage heating, the underlying principle of which is the employment of high or low tension alternating current in an electrode boiler in which water forms the resistance, and after being heated by the passage of the current from electrode to counter electrode is delivered into vessels storing this accumulated heat for use at any desired time. The boiler is of 1 850 kW capacity, and operates off the 6 600 V, three-phase, 50-cycle mains. The plant is automatic in its operation, changes in load being counteracted by means of three insulating cylinders surrounding the electrodes. These cylinders are raised or lowered automatically by means of a small hydraulic motor, in this way varying the effective distance between the electrodes so as to maintain a constant load on the boiler. The latter feeds the heated water into three large, well-lagged storage tanks, the total capacity of which is 27 000 gallons.

ELECTRICITY AND EGGS.

Electrical Devices for Use in Hatching and Testing.

FARMERS interested in the breeding of chickens will be attracted by the "Inventum" electrically-heated "foster mother" marketed by Mr. ALAN WRIGHT (Inventum Electrical Appliances), 117, Victoria Street, London, S.W.1. The unit is of robust construction, having an outer casing of heavy gauge galvanised iron. The element is totally enclosed, and of large dimensions relative to the loading. thus preventing the surface temperature becoming too high for safety. A 3-heat switch is provided, and normally this can be kept at "medium" or "low." The cost of running is stated to work out at approximately half a unit per chick over the complete period during which they require a foster mother. The loading is as follows, F.M.1 and F.M.2 referring to the two sizes of machine available :—

	Watts maximum	Watts medium	Watts low
F.M.1 ..	400	250	150
F.M.2. ..	700	450	250

F.M.1 has a capacity of 150 chicks, and F.M.2 a capacity of 400 chicks. The heights and diameters are respectively 27½ and 31, and 29 and 51 inches, and the weights 77 and 174 lb.

Dishonest persons who attempt to evade the Merchandise Mark Order by deleting the stampings on eggs which show the country of origin are given short shrift by the K.B.B. ultra violet fluorescence cabinet. This device is manufactured by KELVIN, BOTTOMLEY AND BAIRD, LTD., of 18, Cambridge Street, Glasgow, and Imperial House, Regent Street, London, W.1. In this fluorescence cabinet the eggs are seen in their natural pink colour, and any mark which has been formerly applied to the shell is shown up distinctly. The cabinet consists essentially of a metal housing for the quartz burner (of the K.B.B. atmospheric type) mounted on a base fitted with supports so arranged that a large compartment beneath is flooded with ultra-violet light, the visible light being filtered off by a removable light filter let into the floor of the lamp enclosure. A curtain excludes light from outside, thus allowing the fluorescences of substances to be shown up strongly. In the front wall of the housing another removable light filter is fitted to provide a horizontal beam, in order that materials may also be viewed by transmitted radiation. A slide shuts off the beam when necessary. Another slide carries an adaptor in which may be placed quartz cells, special filters or substances to be examined by transmitted radiation.

ELECTRICAL WOMEN.

A new branch of the Electrical Association for Women has been formed in East Devon and the inaugural meeting was held yesterday, Thursday, at the Nisi Prius Court, Exeter Castle, Exeter. The speakers were Mrs. J. M. Phillips, the President, Mrs. Wintringham, Coun. A. E. Brock, Mr. Selwyn S. Grant, Miss M. Partridge, and Miss C. Haslett. The local secretaries are Miss Wilson, 181, Sidwell Street, Exeter, and Miss M. Binney, 57, Hartop Road, St. Mary's Church, Torquay.

A Plymouth branch of the Association has also been formed, and will be formally inaugurated at a meeting arranged for to-day, Friday, over which Viscountess Astor will preside. A committee of twelve has been appointed, with Coun. Mrs. C. Daymond as chairman. Miss M. Hollest, joint hon. secretary, states that it is difficult to say at present whether the programme of the Plymouth branch will include lectures of interest to those in the electrical trade, but it is hoped that Mrs. E. G. Okell, wife of the Plymouth electrical engineer, will address the members on elementary electricity, while visits to the British Broadcasting Corporation's local studio have been arranged. Other suggestions under consideration are a display of electrical Christmas gifts, accompanied by a lecture on them, and a demonstration of electric cooking.

The first annual conference of the Rugby branch of the association was held on October 10th, the anniversary of the inaugural meeting in 1928. Nearly 50 members of the branch were entertained to luncheon and tea by the British Thomson-Houston Co., Ltd., and the afternoon was spent in visiting the Rugby works of this firm. At the annual general meeting, in the evening, with Viscountess Fielding, President of the branch, in the chair, the following officers were elected for the 1929/30 session :—Chairman, Mrs. Knight; Hon. Secretaries, Miss Pedlar and Miss Timms; Hon. Treasurer, Mrs. Kennard.

BRIGHTON ELECTRICAL EXHIBITION.

Further Brief Descriptions of Some of the Outstanding Items at Brighton — Demonstrations of Varied Interest as Part of Exhibits.

(*Concluded from page 470.*)

METRO-VICK SUPPLIES, Metro-Vick House, 155, Charing Cross Road, London, W.C.2, exhibited the "Met-Vick Tudor" imitation coal fire, incorporating a realistic coal fire effect, obtained by means of a standard flame lamp placed at the back of the fire, and controlled independently from the elements. Each element is controlled by a separate switch. This model is obtainable in two sizes: for 2 kW and 3 kW, and in three finishes:—chromium plated oxidised copper and oxidised silver. Another exhibit was the "Met-Vick" electric automatic kettle, already described in THE ELECTRICIAN. The "Met-Vick" iron-de-luxe is a new model specially designed for the easy ironing of delicate fabrics. It weighs 5½ lb., heats up quickly, and keeps its heat under the heaviest working conditions. Other features are the thumb rest, new type connector, and a pressed steel tablestand, so designed that the iron cannot slip off when not in use. The iron is obtainable nickel-plated and blue vitreous enamelled. A wide range of cookers was also displayed.

MOFFATS, LTD., 15, Victoria Street, London, S.W.1, showed a representative selection of their electric cooking ranges. The standard Canadian models range from the E.396 with three ovens, two warming ovens and six boiling rings, to the E.28 with one oven and two hot plates. They are supplied in two finishes, the standard having porcelain enamel top, front and linings, and the "C" finish, which has, in addition, porcelain enamel sides and back legs. All ovens are provided with top and bottom heating elements. Two new models are E.42 and E.43, which have an outside grill and, in addition, a large warming compartment for plates, etc. In the smaller of these, the E.42, there is a combined grilling and boiling element known by the name of "Pyroy." This is totally enclosed, made throughout of good heat-resisting materials, ensuring that quick boiling and efficient grilling are simultaneously obtainable. For small flats and apartments the E.41 model is a very well-made and convenient range. The oven measures 12 in. by 10½ in. by 11 in. high, and has top and bottom elements. A temperature indicator is fitted on the oven door. The upper element is a "Pyroy" and boils a kettle or saucepan and grills or heats the oven simultaneously.

The REVO ELECTRIC CO., LTD., Britannia Works, Tividale, Tipton, Staffs. An excellent display of domestic electrical apparatus was shown on the stands occupied by this company. In the Dome, a comprehensive display of electric fires was given, including new designs, some of which are fitted with the new "Radiabar" element. "Revo" irons and automatic electric kettles were also shown. Electric cooker and water heaters were also exhibited in all sizes for all conditions.

Domestic and Industrial Switchgear.

A. REYROLLE AND CO., LTD., Hebburn-on-Tyne, showed a representative collection of small metal-clad air-break switches, for domestic and other purposes. All the switches are of the quick-make-and-break pattern, and their covers are interlocked so that it is impossible to open them when the switches are in the "on" position, or to close the switches when the covers are off. The domestic switches included a cooker control board with a red lens and an indicating lamp to show when the switch is on. There was also a change-over switch for those who contemplate water heating as well as cooking by electricity. This switch is arranged so that the supply can be taken to either the cooker or the heater, whichever is desired. A board was also exhibited showing a number of plugs and sockets that have been manufactured to B.S.S. No. 196-1927. Since this specification deals with 5 A, 15 A, and 30 A sizes, it marks an important stage in development, because it provides for metal-clad enclosure of these comparatively small plugs and sockets, and so introduces, for domestic apparatus, a safe connector for portable appliances. Another interesting exhibit was a showboard with a number of fuses mounted on it. These are designed to comply with the H.O. Regulations and to be used on circuits working at pressures up to 660 V. The fuses are built with self-aligning contacts and are ventilated. Some ironclad switch type fuse boxes were also exhibited. These consist of a box containing two clips into which the fuse is inserted. The action of opening the lid of the box withdraws the fuse and isolates the circuit.

SADIA, LTD., 22, Newman Street, London, W.1, displayed the well-known "Sadia" automatic electric water heaters, of which, it is claimed, there are over 30 000 now in use. This apparatus is a self-contained unit, very efficiently heat insulated, similar to a thermos flask. The water is heated by special electrical elements, which take only a small amount of current, and are connected automatically to the supply mains by means of a thermostatic switch until the water in the heater has attained the storage temperature of 190 deg. F. When hot water is drawn from the heater, its place is taken by an equal quantity of cold water, and the thermostatic switch again connects the element to the mains until the contents of the tank once more reach the storage temperature. A complete domestic hot water service for a small house can be provided for 800 to 1 000 W. We are informed that nine gallons of water from the Sadia heater, mixed with 15 gallons of cold water, will provide 24 gallons of bath water at 102 deg. in less than 5 min., and at a cost not exceeding 3d. (with electricity at ¾d. per unit). The heaters are finished in white enamel, with nickel-plated fittings.

Another Water Heater.

SANTON, LTD., 149/150, Dock Street, Newport, Mon., exhibited and demonstrated the "Santon Circulator" hot water system. This, it is claimed, is simple and easily installed and does not interfere with existing regulations of either water or electricity departments. The method of fixing the circulator in the tank was demonstrated on the stand. When the current is switched on the water inside the circulator becomes heated, rises, and flows through the outlet at the top of the tube, remaining at the top of the tank ready to be drawn off at any of the taps in the house. Other exhibits included the "Santon" electric tank belt, which has already been described in these pages. It is supplied in three loadings, 500, 750, and 1 000 W, to fit tanks up to 57 in. in circumference.

SIEMENS ELECTRIC LAMPS AND SUPPLIES, LTD., 38-39, Upper Thames Street, London, E.C.4. The exhibits here comprised a full range of "Xcel" electric domestic appliances, and cooking demonstrations were given. Other exhibits were electric irons, kettles, toasters, milk warmers, shaving pots, fires, etc., including new models of the popular "Cosyglo" imitation coal fires with moving flame and smoke effect. The new "Xcel Minor" cooker was also shown as well as "Ultralite" fittings.

JAMES STOTT AND CO. (ENGINEERS), LTD., of Vernon Works, Oldham, demonstrated their well-known water boilers and café sets for hotels, cafés, canteens, etc. The instantaneous water boilers are specially constructed to give nothing but boiling water at the draw-off tap. The water is heated by immersers which are split up into a main and byepass, each being controlled by a separate rotary snap switch mounted on the base of the boiler. A feature of these appliances is their accessibility for cleaning in hard water districts. By the unscrewing of one nut, which can be done with the fingers, the complete interior can be withdrawn for cleaning and removal of deposit. The construction of the elements has also been specially arranged for use in hard water districts. The top of the boiler can be fitted with a flat bain marie tray for warming teapots, pies, etc., etc. The boiler is fed automatically with cold water from the main. The "Stott" café set comprises the boiler as above, on each side of which is mounted an earthenware or nickel-lined urn, of any desired capacity. One urn is fitted with a specially arranged draw-off tap, and is for milk warming. The other urn is arranged for coffee making and warming.

YOUNG, OSMOND AND YOUNG, LTD., Unity Works, Welwyn Garden City, exhibited a range of "Unity" tubular electric heaters for schools, churches, cinemas, factories, hospitals, public buildings, offices, private houses, etc., towel airers, four bar radiators, anti-condensation window heaters, linen cupboard heaters, car heaters, tubular heaters for traction work, and thermostats to maintain constant air temperature, all of which have been dealt with in previous issues of THE ELECTRICIAN.

SIR ALEXANDER KENNEDY.

Memorial to Late Pioneer in Engineering Education.

SIR Alexander Kennedy was a pioneer in engineering education, for, during his tenure of the Chair of Mechanical and Civil Engineering (1874–1889) at University College, London, he was largely responsible for the lines and methods which higher education in engineering has adopted. As an engineer in practice, his wide knowledge of mechanical and electrical engineering was always available for the service of the country. There was a strong feeling common to all who knew him and his work, that a permanent and lasting memorial of the affection and esteem in which he was held should be established. The movement was accordingly initiated in 1926, to endow the Chair of Mechanical and Civil Engineering at University College, London, which he held with such distinction. The amount required for this purpose was £30 000, towards which a sum of £18 035 has already been subscribed, leaving the amount of £11 965, still to be raised. A considerable proportion of this sum was subscribed before Sir Alexander Kennedy's death, to a large extent by his old students and personal friends.

Some of the Subscribers.

Since his death, subscriptions have been received from the following: Mr. A. H. Abbot, Mr. R. W. Allen, Mr. G. C. Allingham, Mr. J. Angus, Sir John Aspinall, Mr. L. W. Atcherley, Mr. F. Ayton, Mr. Frank Bailey, Prof. Francis Baily, Mr. H. G. Foster Barham, Prof. Archibald Barr, Mr. Onward Bates, Mr. A. R. Bellamy, Bellis and Morcom, Ltd., Mr. W. M. Bergin, Mr. Rustat Blake, Mr. J. P. Bowen, Mr. C. V. Boys, the British Thomson-Houston Co., Ltd., Mr. R. P. Brousson, Mr. Robert A. Bruce, Mr. Alfred H. Burbidge, Mr. Henry Burkinshaw, Mr. Charles Burnet, Signor G. Carosio, Mr. R. A. Chattock, Sir Dugald Clerk, Prof. W. C. Clinton, Prof. E. G. Coker, Mr. C. E. Commans, Lord Congleton, Mr. W. W. Cook, Mr. Edgar Cox-Walker, Mr. A. C. Cramb, Mr. H. H. Dalrymple-Hay, Mr. F. R. Davenport, Mr. Claud S. Day, Mr. Maurice Deacon, Dr. S. Z. de Ferranti, Mr. Edward W. Dickenson, Capt. J. M. Donaldson, Mr. S. B. Donkin, Mr. Alexander Dow, Mr. R. Dumas, Mr. Walter Dunn, Mr. G. H. Eaton, Mr. A. C. Eborall, Lt.-Col. K. Edgcumbe, Mr. Talfourd Ely, Mr. F. O. Everard, Mr. Sydney Evershed, Ferguson, Pailin, Ltd., Mr. T. J. Fleming, Prof. George Forbes, Sir Henry Fowler, Mr. H. P. Gaze, Sir Alexander Gibb, Mr. Frank Gill, Prof. John Goodman, Prof. J. W. Gregory, Mr. S. K. Gurtu, Sir Robert Hadfield, Sir Brodie Henderson, Mr. J. S. Highfield, Sir Henry Jackson, Mr. Bernard M. Jenkin, Mr. K. J. Kaula, Mr. J. M. Kennedy, Prof. Arthur E. Kennelly, Mr. H. W. Kolle, Mr. Edwin C. Lacey, Mr. W. W. Lackie, Mr. H. C. Lamb, Mr. H. W. Lash, Mr. J. E. Lea, Mr. Edward H. Leaf, Lt.-Col. Henry M. Leaf, Col. David Lyell, Prof. J. C. McLellan, Mr. A. Woodruffe Manton, Mr. Howard Martineau, Mr. Sydney Martineau, Mr. J. W. Meares, Metropolitan-Vickers Electrical Co., Ltd., Mr. C. T. Millis, Mr. T. Mohn, Sir Ernest Moir, Mr. Richard Moreland, Mr. K. S. Murray, Mr. H. F. Newall, Mr. W. H. Newman, Mr. J. C. Peache, Mr. C. D. Pearson, Mr. David T. Powell, Mr. F. E. Proctor, Dr. A. H. Railing, Dr. Mario da Andrade Ramos, Sir Hugh Reid, Mr. W. D. Reynolds, Lord Riddell, Mr. F. W. Roberts, Mr. Arthur Rogers, Sir Ernest Rutherford, Mr. L. Gordon Rylands, Mr. Edwin Seddon, Mr. Joshua Shaw, Mr. W. H. Shortt, Mr. Charles W. Smith, Sir J. Walker Smith, Mr. Roger T. Smith, Mr. J. M. Smyth, Sir John Snell, Mr. C. E. Stromeyer, Mr. A. Struben, Dr. Ambrose Swasey, Eng.-Captain H. R. Teed, R.N., Mr. F. C. Temple, Mr. W. J. Tennant, Mr. J. C. F. Thomas, Lt.-Col. W. A. Vignoles, Lord Weir, Mr. Thomas Weir, Mr. Robert S. Whipple, Mr. T. P. Wilmshurst, Mr. Edgar Worthington, Dr. W. Barton Worthington, Sir Alfred Yarrow, and Mr. F. A. Yerbury.

The movement is supported by the Royal Society, the Institutions of Civil Engineers, Mechanical Engineers, and Electrical Engineers. It is desired to complete the fund as soon as possible by raising the amount of £11 965. Subscriptions should be sent to Lord Meston, at University College, Gower Street, London, W.C.1.

The current issue of the "Henley Telegraph" marks an interesting stage in the life of the magazine. Its price is reduced to 2d. The high standard of matter, production, and printing remains the same, but because of an increased grant from the company it has been possible to reduce the price from sixpence.

LEON GASTER MEMORIAL.

Proposed Fund to Establish Special Illuminating Premium.

NEARLY two years have elapsed since the death of Mr. Leon Gaster, Founder, vice-President and Honorary Secretary of the Illuminating Engineering Society, and during this period the feeling has been present in the minds of many that there is a strong desire among members of the Society to commemorate in a fitting way the services which he rendered to the society and to illuminating engineering during nearly 20 years. The Council has concluded that there is no better way of doing this than by linking Mr. Gaster's name with some scheme which will further the aims which in his lifetime he strove to foster, namely, to increase the reputation of the society, to stimulate a high standard in the papers and contributions which are submitted to it, and to encourage experiment, research and investigation. The Council has accordingly decided to institute a "Leon Gaster Memorial Fund." It is proposed that a fund of not less than £200 shall be collected, the interest on which shall be devoted primarily to the establishment of a Premium to be awarded annually for the best contribution from a subscribing member of the society on any aspect of illuminating engineering which is submitted to the Illuminating Engineering Society during the year. It is proposed that the Premium should be used for the purchase of books, instruments or apparatus, as the recipient may desire, and that it should be accompanied by a certificate on vellum recording the award. It is hoped that the requisite fund will be collected and the necessary Trust completed in time for the first award to be made in 1931.

Promises of contributions to the fund ranging from 5s. to £5 5s. have already been received. If all members of the Society will subscribe, each according to his ability, it should be possible to establish a memorial which will worthily commemorate Mr. Leon Gaster's services to illuminating engineering.

Contributions or promises should be sent to the Hon. Secretary, Mr. J. S. Dow, 32, Victoria Street, London, S.W.1.

THE NEW INDIVIDUALISM.

Definitions of the True Individualist.

THE twenty-seventh Individualist Luncheon took place on October 16th, at the Hotel Cecil, London, when Coun. Miss Bright Ashford, gave an address on "The New Individualism," during the course of which she said that one of the tenets of Socialism was its championship of the bottom dog. The English character exhibited a love of benevolence. She had noticed, however, that members of public bodies loved the opportunity of being benevolent with other people's money. In this regard, Miss Ashford exemplified the parable of the Good Samaritan. The Samaritan did good and spent his own money and energy in so doing. This was Individualism. A Socialist, faced by the same situation, would have called a meeting and passed a resolution. To show the difference between various points of view, Miss Ashford referred to methods of transporting people in use at tube stations at different times. The oldest method was the staircase. This was parallel to the Old Individualism. It was a case of the most active people getting ahead, and the devil take the hindmost. The next method in use, the lift, was parallel to Socialism. Everybody had to wait, whether they could walk swiftly or slowly. In this way, enterprise was kept back to the level of the lowest. The latest method in use, the escalator, was parallel to the New Individualism; it gave opportunities to all. The enterprising and active could hurry on; the slower ones could stand, yet still be carried on their way. In the same way, the New Individualism helped the slow without keeping back the more enterprising. Individualists made use of enterprise and benevolence without vitiating the character of the people.

PATENTS AND DESIGNS.

The committee set up under the chairmanship of Sir Charles Sargant to consider whether any amendments in the Patents and Designs Acts, or any changes in Patent Office practice, were desirable, are continuing their meetings at the Board of Trade for the purpose of hearing evidence from interested parties. Any persons or associations who desire to submit suggestions, or to give evidence, should communicate with the secretary, Mr. R. W. Luce, Industrial Property Department, Board of Trade, 25, Southampton Buildings, W.C.2.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, where available.

SMETHWICK EDUCATION COMMITTEE.—Electric or other heating system in the new Uplands School. Further particulars from the Director of Education, 215, High Street, Smethwick.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, October 25th.—One 130 ton, 4-motor, electric, engine room crane, one 15-ton, 3-motor, electric, auxiliary bay crane, and one 10-ton, 3-motor, circulating pump house crane, at Ironbridge power station. Specification (No. 6) from Mr. E. F. Hetherington, chief engineer and manager; deposit £1 1s.

CARLISLE CORPORATION, October 28th.—Electrical installations to 250 houses on Raffles-Newtown and Botcherby estates. Specifications, etc., from the City Engineer, 18, Fisher Street, Carlisle.

GLASGOW CORPORATION, October 28th.—Electric cable, steel poles, lanterns and cast iron bases, for street lighting. Specifications, etc., from the Inspector of Lighting, 20, Trongate, Glasgow.

WEST RIDING EDUCATION COMMITTEE, October 28th.—Electric light installation at Whitwood Mining and Technical Institute. Specification, etc., from the Education Officer, County Hall, Wakefield.

BRAINTREE RURAL DISTRICT COUNCIL, October 29th.—Supply and fixing of electrically driven and automatically controlled high lift centrifugal pumping plant. Specifications, etc., from Mr. J. D. Haworth, 3, Central Buildings, Westminster, S.W.1; deposit £5.

METROPOLITAN ASYLUMS BOARD, October 30th.—Central battery telephone system at South-Western Fever Hospital, Landor Road, Stockwell, London, S.W.9. Specification from the Board's Office, Victoria Embankment, E.C.4; deposit £1.

AYR COUNTY COUNCIL NORTHERN DISTRICT COMMITTEE, October 31st.—Electric lighting work, in connection with erection of 200 houses at Beith, Dalry, Dreghorn, Dunlop, Kilbirnie, Kilwinning, Stevenston and West Kilbride. Intending offerers are asked to communicate with Mr. C. B. Ramsay, District Clerk, Kilwinning, by October 31st.

STAFFORDSHIRE EDUCATION COMMITTEE, October 31st.—Electric light installation in two new elementary day schools in Brettell Lane, Brierley Hill. Specification from Messrs. Moffett, Rosher and Mann, Union Chambers, Temple Row, Birmingham; deposit £5 5s.

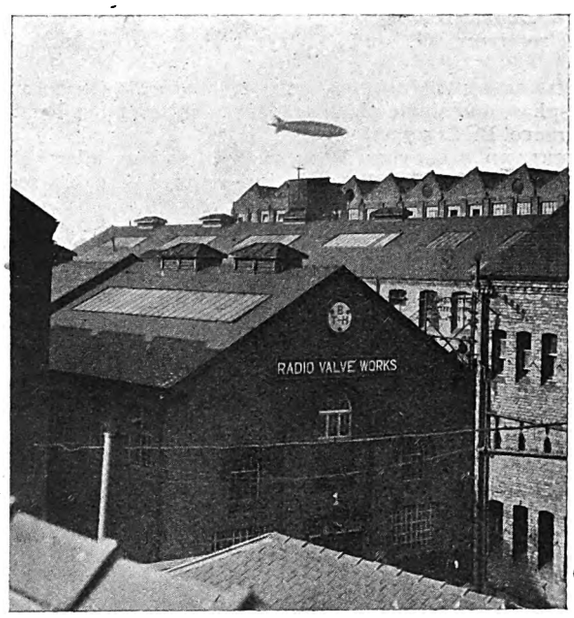
BRADFORD CORPORATION, November 9th.—Twelve month's supply of stores to the tramways department, including electrical fittings for tramcars, insulating material, insulated bolts, copper controller contacts, etc. Schedules, etc., from Mr. R. H. Wilkinson, general manager, 11, Forster Square, Bradford.

CENTRAL ELECTRICITY BOARD, November 9th.—Supply and erection of overhead 33 000 V transmission lines in South Lincolnshire, in connection with Mid-East England scheme. Specification (No. M.E.E.—S.L.1) from Mr. R. H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, Charing Cross, London, W.C.2; deposit £2 2s.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, November 15th.—Supply and erection at Ironbridge power station of (*a*) two 6 000 kVA, 33 000/3 300 V, 50 cycle, indoor type transformers, with off-load tap changing switches; (*b*) two 1 200 kVA, 3 300/400/230 V, 50 cycle, indoor type transformers, with off-load, tap changing switches; (*c*) two 150 kVA, 3 300/400/230 V, 50 cycle, indoor type transformers, exclusive of tap-changing switches. Specification (No. 7) and form of tender from Mr. E. F. Hetherington, at the offices of the Authority, Phœnix Buildings, Dudley Road, Wolverhampton; deposit £1 1s.

WAREHAM CORPORATION, November 16th.—Four centrifugal pumps and electric motors, with automatic control, etc. Specifications from Mr. W. E. Blizard (Messrs. Lemon and Blizard), Castle Lane, Southampton; deposit £2 2s.

MID-GLAMORGAN WATER BOARD, November 18th.—Electric lighting work, supply of transformers, switchboards, meters, etc., in connection with construction of pumping station, etc., at Schwyll, Ewenny, near Bridgend, and installation of electrical depth transmitters on various reservoirs, with cables, etc. Specifications, etc., from the Board's Offices, Bridgend, or from Messrs. Thomas and Morgan and Partners, civil engineers, Pontypridd; deposit £2 2s.



THE R.101 over the Rugby works of the British Thomson Houston Co., Ltd., during the flight over the provinces on October 18th. A picture of the kitchen on board is given on page 509.

EAST RETFORD CORPORATION, November 19th.—Electrically driven centrifugal borehole pump (60 000 gall. per hour). Specification from Mr. S. O. Pacey, Gas and Water Electricity Offices, East Retford; deposit £2 2s.

WALLINGFORD RURAL DISTRICT COUNCIL, November 19th.—Electric light wiring of 34 houses at Cholsey, Berks. Specification, etc., from the Clerk, 7, St. Martin's Street, Wallingford.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

JOHANNESBURG MUNICIPALITY, October 26th.—Supply of time switches, with automatic astronomical dial, electrical operation and winding, for street lighting use (contract No. 263). (Reference B.X. 5 709.)

JOHANNESBURG MUNICIPALITY, October 26th.—Three-phase 6 600 V, draw-out truck type switchboard panels, suitable for installation as single panels or coupled to form a multiple panel switchboard (contract No. 262). (Reference B.X. 5 710.)

DUBLIN UNITED TRAMWAYS CO. (1896), LTD., October 28th.—Twelve months' supply of electric lamps and fittings, etc. Forms of tender (2s. 6d.) from the Company's Offices, 59, Upper O'Connell Street, Dublin.

EGYPTIAN MINISTRY OF THE INTERIOR, October 28th (extension of time).—Erection and equipment of electric power station (about 500 kVA), with overhead and underground networks, for the town of Menouf. (Reference B. 5 758.)

INDIAN STORES DEPARTMENT, October 28th.—House service meters for one year (order No. N. 10 282.) (Reference B.X. 5 749.)

NEW SOUTH WALES GOVERNMENT RAILWAYS, October 29th.—Railway traction motor testing equipment, comprising electric motor, booster, main field excitation generator and

Digitized by Google

short field exciter (quotation No. B.E. 508). (Reference B.X. 5 693.)

NEW ZEALAND POSTS AND TELEGRAPHS, October 29th.—Telephone cable (specification No. 256). (Reference B.X. 5 788.)

POSTMASTER-GENERAL'S DEPARTMENT, Melbourne, October 29th.—Supply of v.i.r., lead covered cable (schedule C. 510). (Reference No. 5 759.)

MELBOURNE CITY COUNCIL, October 30th.—Two 2 500 kW motor-convertors and accessories, or two 2 500 kW rotary convertors, with transformers and accessories. (Reference B.X. 5 570.)

NEW ZEALAND POSTS AND TELEGRAPHS, October 30th.—Head receivers (P. and T. 151/1/725). (Reference V.X. 5 603.)

JOHANNESBURG MUNICIPALITY, October 31st.—Outdoor type three-phase and single-phase transformers (contract No. 266). (Reference B.X. 5 736.)

AUCKLAND ELECTRIC POWER BOARD, November 4th.—Distribution pillar shells and link units and cable sealing ends. (Reference B.X. 5 682.)

AUCKLAND ELECTRIC POWER BOARD, November 4th.—Low tension porcelain insulators, etc. (Reference B.X. 5 648.)

EGYPTIAN DEPARTMENT OF PUBLIC HEALTH, November 5th.—Supply of 31 electric refrigerators. (Reference A.X. 8 632.)

TORONTO MUNICIPALITY, November 5th.—One 10 000 000 gallon centrifugal pump, and electric motor, with bedplate, switchboard, etc. (Reference A.X. 8 703.)

EGYPTIAN MINISTRY OF THE INTERIOR, November 30th.—Diesel engine driven electric lighting installation at Abou-Tig (Assiut Province). (Reference B.X. 5 791.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, December 17th.—Secondary batteries (schedule C. 505). (Reference B.X. 5 777.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, December 17th.—Telephone fuses, heat coils and protectors (schedule C. 498). (Reference B.X. 5 784.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, December 17th.—Loading coil pots (schedule C. 499.) (Reference B.X. 5 785.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 11th.—Supply of 66 kV switchgear and protective system for Lyttelton, Lake Coleridge power scheme, section 217. (Reference B.X. 5 796.)

VICTORIAN RAILWAY COMMISSION, March 30th.—Supply of d.c. neutral relays for power signalling purposes (contract No. 43 457). (Reference B.X. 5 793.)

Tenders Accepted.

DOUGLAS CORPORATION.—Lawton and Co., electric lighting of abattoir.

GUILDFORD CORPORATION.—A. Grove, wiring 14 houses at Westborough, £82 12s.

BATTLE GUARDIANS.—D. Slade, electrical apparatus for heating board room, £11 5s.

INDIAN STORES DEPARTMENT.—Vaughan Crane Co., Ltd., overhead electric travelling crane, and spares, £698.

AYR CORPORATION.—W. G. Dodds, Ltd., electric light and heating installation at Northpark House, £33 16s. 3d.

LANARKSHIRE COUNTY COUNCIL.—Johnston, Park and Co., Ltd., electrical work at new offices, Glasgow, £1 449 1s. 10d.

GLASGOW CORPORATION.—Belling and Co., supply of 3 800 electric fires; Venner Time Switches, Ltd., 50 time switches.

HUDDERSFIELD GUARDIANS.—E. Rayner, electrician's work in connection with erection of mortuary, etc., at Crosland Moor Institution.

NORTHERN PROVINCES ELECTRICITY CO., HOLLAND.—C. A. Parsons and Co., Ltd., two 30 000 kW turbo-generators and condensing plant.

STOKE-ON-TRENT CORPORATION.—Supply of electric lamps, Blackburn, Starling and Co., Barnett and Soans, and Robinson and Hands Electric Co., Ltd.

LOUTH CORPORATION.—Power Lines Construction Co., Ltd., cable and street works, £12 817; Crompton Parkinson, Ltd., sub-station equipment, £1 311.

STAFFORD CORPORATION.—Callender's Cable and Construction Co., Ltd., supply and erection of cable, £292; English Electric Co., Ltd., supply of transformer, £120.

LIVERPOOL CORPORATION.—British Thomson-Houston Co., Ltd., supply and erection of main and auxiliary switchgear at new Clarence Dock power station, £72 651. (Recommended.)

NEWRY URBAN DISTRICT COUNCIL.—Brooks, Thomas and Co., Ltd., electric lighting installation in town hall, £470; J. S. Loughran, electric lighting installation in technical school, £175.

STOKE-ON-TRENT CORPORATION.—Barnett and Soans, electric services in new cubicle block and garage at isolation hospital, £215 12s. 8d.; Painter and Madew, electric lighting installation at Stallington Hall, £369 12s. 9d.

Mercury Arc Rectifier.

SHOREDITCH (LONDON) BOROUGH COUNCIL.—Hewittic Electric Co., Ltd., supply of 2 000 kW mercury arc rectifier equipment at Hearn Street sub-station, £8 967, plus £85 10s. for spare bulb and fuses. (Recommended.)

METROPOLITAN WATER BOARD.—Macintosh Cable Co., Ltd., 306 yds. of two-core, 0·5 sq. in., shaped conductors, paper insulated, lead covered, 500 V cable, three joint boxes, one pothead cable end, and one cable end box, for Hampton works, £375.

SOUTHEND-ON-SEA CORPORATION.—General Electric Co., Ltd., motors for Hamstel Road sewage pumping station, £246; E. K. Cole, Ltd., rectifiers, for adapting eliminator units to a.c. supply; Union Cable Co., Ltd., a.c. cables, £14 534 15s., less 2%.

MANCHESTER CORPORATION.—Mather and Platt, Ltd., motor-generator, and A. Loudon, electric light installation at Central High School for Boys; Metropolitan-Vickers Electrical Co., Ltd., conversion of two worm-drive tramcar motors to axle suspension.

MANCHESTER CORPORATION.—T. Bolton and Sons, internal rail bonds; British Insulated Cables Ltd., round, flexible face rail bonds; British Mannesmann Tube Co., Ltd., steel tramway poles; Murex, Ltd., Thermit welding of tramway rail joints. (All recommended.)

METROPOLITAN WATER BOARD.—G. A. Sayer, renovations and electric light installation at district engineer's residence and offices, Brookmill Road, Deptford, £490. (Recommended.) Also tendered: T. Crossley and Son, £491; Douglass, Halse and Co., £497; H. Groves and Son, £518; Sidey and Harvey, £544; Hammond and Barr, Ltd., £606.

SYDNEY CIVIC COMMISSIONERS.—British General Electric Co., supply of Osram lamps. The contract covers practically the whole of the street lighting requirements of Sydney for a year, amounting to about 105 000 240 V 60 W Osrams, and some 20 000 larger type vacuum and gasfilled lamps. The whole of the lamps will be made at the Osram Lamp Works, Hammersmith, London.

STOKE NEWINGTON (LONDON) BOROUGH COUNCIL.—W. T. Henley's Telegraph Works, Co., Ltd., supply of e.h.t. and pilot cables, £800 per 1 000 yds.; General Electric Co., Ltd., supply of rotary converting plant and switchgear, at southern sub-station, £8 325; Andstro (A.A.) Electric, installation work in private premises under assisted wiring scheme, 18s. per point; Croydon Cable Co., Ltd., supply of l.t. cable for 12 months. (All recommended.)

REIGATE CORPORATION.—Callender's Cable and Construction Co., Ltd., supply and laying of 1 800 yds. of 0·2 sq. in., h.t., concentric, paper insulated, lead covered and armoured cable, from the electricity works to Redhill, £1 574. Also tendered: Macintosh Cable Co., Ltd., £1 625; W. T. Henley's Telegraph Works, Co., Ltd., £1 613; Standard Telephones and Cables, Ltd., £1 611; G. Parfitt and Co., £1 668; Liverpool Electric Cable Co., Ltd., £1 640; Pirelli-General Cable Works, Ltd., £1 630; Power Lines Construction Co., Ltd. (not to specification), £1 487; Johnson and Phillips, Ltd., £1 618; Enfield Cable Works, Ltd., £1 652; W. T. Glover and Co., Ltd., £1 638; British Insulated Cables Ltd., £1 644; Siemens Bros. and Co., Ltd., £1 624.

GLASGOW CORPORATION.—13 rotary convertors, reconstructed, £21 350 4s., Metropolitan-Vickers Electrical Co., Ltd.; new and reconstructed rotary convertor plant, £16 147 12s. 3d., British Thomson-Houston Co., Ltd.; five rotary convertors, reconstructed, £11 428, Bruce Peebles and Co., Ltd.; two rotary convertors, reconstructed, £1 386 os. 6d., English Electric Co., Ltd.; two rectifiers, £2 594, Hewittic Electric Co., Ltd.; re-winding alternator, £9 800, C. A. Parsons and Co., Ltd.; one transformer, £495, Ferranti, Ltd.; 20 000 V cable, £304 4s. 7d., Callender's Cable and Construction Co., Ltd.; 5 000 meters, reconditioned, £4 187 10s., Chamberlain and Hookham, Ltd., Ferranti, Ltd., Edison and Swan Electric Co., Ltd., and Metropolitan-Vickers Electrical Co., Ltd. (All recommended.)

WORK IN PROSPECT.

ACTON.—Large departmental stores, for London Co-operative Society. Architect, Mr. A. Hulbert.

BRIGHTON.—New bank premises, for Barclays Bank, Ltd. Messrs. Clayton and Black, architects.

CHISLEHURST.—Cinema, corner of Albany Road and Red Hill. Architect, Mr. J. B. Ferrugia.

COVENTRY.—Extensions, Stoke Schools, for Borough Education Committee. Particulars from clerk, Mr. Frederick Smith.

CROYDON.—Shops and offices, 87-89, High Street. Mr. E. Bates, architect.

DALSTON.—Block of shops, for L.M. and S. Railway, at Dalston Junction Station. Company's architects.

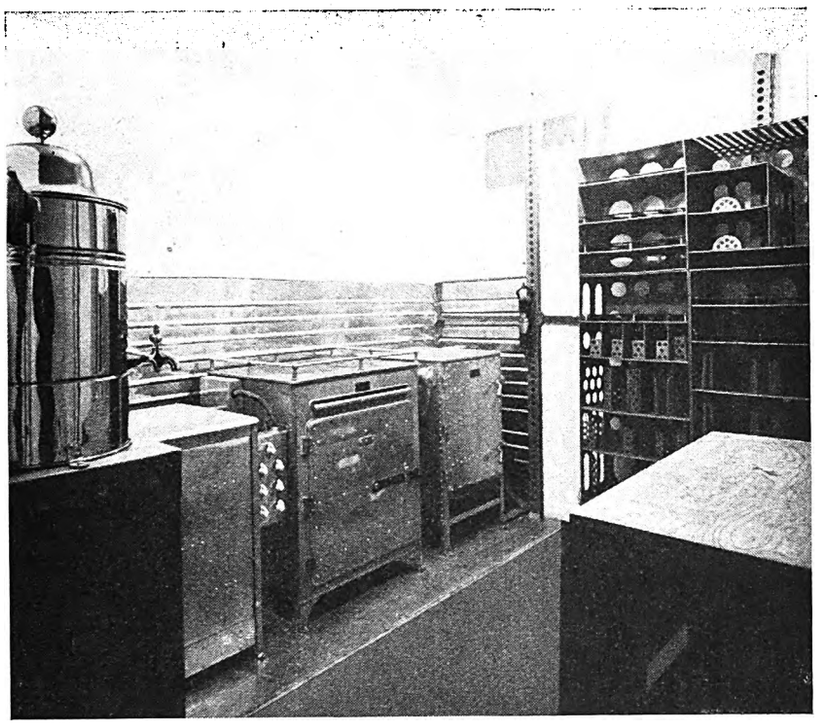
ERDINGTON.—School (576 places). Mr. James A. Swan, Birmingham.

HUDDERSFIELD.—Shops, offices, and warehouse in Burton Road. Mr. N. Culley, architect, Huddersfield.

ROMFORD.—Ward block building, to cost £33 677, for Board of Guardians. Particulars from contractors, S. E. Adams and Co., Westcliff, South-end-on-Sea.

RUGBY.—Church, Hillmorton Paddox, for Wesleyan Trustees. Particulars from Secretary.

SALFORD.—School, Lower Broughton, for Borough Education Committee. Particulars from Director of Education.



GREAT interest attaches to the new British Government Airship R101, *and, as already announced in* THE ELECTRICIAN, *special light-weight electric cooking and water-heating apparatus have been installed by the Automatic Telephone Manufacturing Co., Ltd., Strowger Works, Liverpool. The equipment—into the construction of which duralumin, the lightweight alloy, largely enters—comprises five separate items. The cooking range has four totally-enclosed boiling plates, whilst the hob plate is surrounded by a guard rail to ensure the stability of utensils placed upon it. The oven has a cooking space of 24 in. by 24 in. by 18 in., and the entire range is wired for three-heat control. A vegetable steamer with a capacity 18 in. by 22 in. by 24 in. is installed, with a ball-valve tank attached to the right-hand side for maintaining a continuous supply of hot water to compensate for the evaporation loss. The hot cupboard measures 3 ft. 6 in. by 1 ft. 10 in. by 2 ft. 8 in. It has sliding doors, perforated metal shelves, and the top is recessed to function as a carving table and to facilitate the retention of plates etc., placed upon it. To ensure a supply of hot water for dish washing, etc., a 40-gallon cylindrical hot water storage tank is provided, although it is not visible in the photograph. Smaller demands for tea, etc., are met by a 3-gallon urn, protected against burn-out in the absence of water by a thermal cut-out. Having regard to the importance of weight limitation, it is interesting to record that the total weight of the completed equipment works out within 10-lbs. of the limit set by the Air Ministry. This photograph was taken at Cardington by Siemens Electric Lamps and Supplies, Ltd., the distributors of "Xcel" electrical domestic appliances, and shows the apparatus installed in the galley.*

SHANKLIN.—Houses, for Urban District Council. Particulars from contractor, Mr. H. W. Brown, Newport Road, Lake.

STAINES.—Houses (94), for Urban District Council. Particulars from contractors, Blackwell and Meyer, Bexley Heath.

STRETFORD.—Extensions, Seymour Park School, to cost £3 279, for Education Committee. Particulars from the Clerk.

SUTTON ST. JAMES.—Parish Hall. Particulars from vicar, Rev. J. Callister.

SWINDON.—Bus garage for 40 vehicles, for Town Council. Particulars from architects, R. J. Beswick and Son, 10, Victoria Road.

WEST HAM.—Two nursery schools, for Borough Education Committee. Particulars from architect, Mr. John H. Jacques, 61, West Ham Lane, Stratford, London, E.

WESTON-SUPER-MARE.—Extensions, Public library. Particulars, Messrs. Fry, Paterson and Jones, 28, Waterloo Street.

WEYBRIDGE.—Extensions, including children's ward, for Hospital Management Committee. Particulars from Secretary.

WIGAN.—School (40 places). Particulars from the Secretary.

TRADE PUBLICATIONS.

FURSE WHOLESALE, LTD., of Traffic Street, Nottingham, have issued a new stock list, No. 24/29.

The new price list of the NOX ELECTRIC LAMP CO., LTD., of Clarence Road Works, Hunslet, Leeds, is now available.

A new stage spot-light catalogue has been issued by the GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, London, W.C.

The A. E. G. ELECTRIC CO. LTD., 131, Victoria Street, London, S.W.1, has published a special leaflet concerning "Furniculus" fires.

"Lisenin" connectors are the subject of a new folder by the LISENIN WIRELESS CO., of 5, Central Buildings, High Street, Slough.

The WEST GLOUCESTERSHIRE POWER CO., LTD., of Gloucester, has issued an attractive booklet for public use entitled "Electricity in the Home."

A. P. LUNDBERG AND SONS, LTD., 477/489, Liverpool Road, London, N.7, have sent us a copy of leaflet E.1, 78, devoted to a description of the "Tripolite" switch.

The WHOLESALE ELECTRIC LAMP CO., LTD., of 37, Vauxhall Bridge Road, London, S.W.1, has issued a leaflet detailing particulars of the company's manufactures in bowl and bar fires.

BAILY, GRUNDY, AND BARRETT, LTD., 2, St. Mary's Passage, Cambridge, have recently produced a thermionic relay, for use in connection with temperature control, and a pamphlet has been published.

The BRITISH THOMSON-HOUSTON CO., LTD., Crown House, Aldwych, London, W.C.2, has issued L.499 dealing with 150 V Mazda lamps.

The EDISWAN ELECTRIC CO., LTD., 123, Queen Victoria Street, London, E.C., has published special literature with respect to the company's lamp sales campaign.

The IGRANIC ELECTRIC CO., LTD., 149, Queen Victoria Street, London, E.C., has published leaflet No. 6 499, dealing with jack switching diagrams; No. 6 611, concerning h.t. supply units; and No. 6 607, relative to dual wave coils.

SIEMENS BROTHERS AND CO., LTD., Woolwich, London, S.E., have published catalogue 820, section 2, dealing with temperature indicators; section 3, temperature indicators and selector switches for use with thermo-electric pyrometer stems; section 4, thermo-electric pyrometer stems; sections 5 and 6, dealing with the same subject; and section 7, compensating cables and cold junction temperatures. Catalogue 825, section 1, dealing with electrical thermometers and pyrometers for ships, and catalogue 840, section 2, concerning electrical distance thermometers have also been issued.

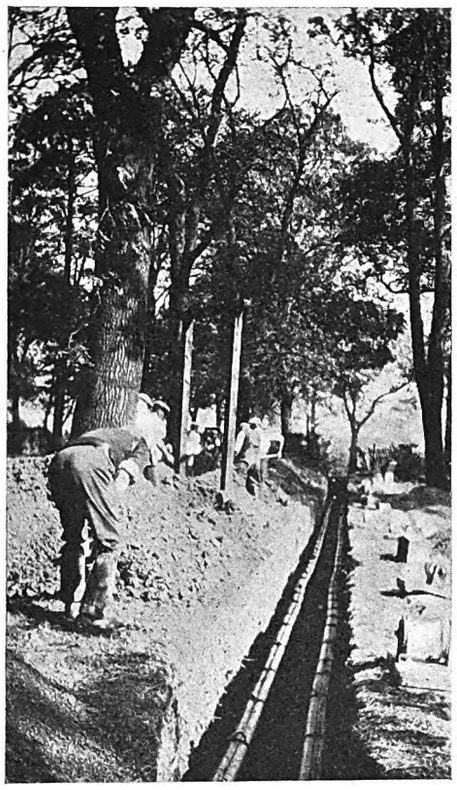
ELECTRICITY SUPPLY.

Bicester Supply Inaugurated—Starting of New Plant at Brighton—Eastbourne Decorative Lighting—Offer to Purchase Wakefield Undertaking.

CHICHESTER T.C. is to apply for a loan of £10 000 for mains extensions.

Worthing T.C. has received sanction to a loan of £20 000 for mains and services.

Barnsley Electricity Committee is to extend the distribution mains to housing estates, at a cost of £6 330.



A SNAPSHOT taken in the "rural area" of Regent's Park during the laying of the 66 kV cables by British Insulated Cables Ltd., for the London "grid" system.

Irlam Council is about to engage an engineer to report on the prospects of a local electricity supply scheme.

Marple U.D.C. has withdrawn its objection to the proposal of the Trent Valley and High Peak Electricity Co. to supply current in Mellor.

Torquay Electricity Committee has adopted a scheme prepared by Mr. T. W. Mackay for the supply current to Stoke Gabriel, at a cost of £2 915.

Torrington R.D.C. has agreed to the application of Bideford Electric Light Co. for powers to extend the area of supply to Alverdiscott, Huntshaw, and Yarnscombe.

Lowestoft Electricity Committee has obtained the consent of the Minister of Transport to the erection of overhead lines to Kessingland for transmission at 6 000 V.

The supply of current to Bicester was formally inaugurated on October 7th, by Mrs. Ruck Keene at the Wessex Electricity Co.'s sub-station at Market Square, Bicester.

Lichfield R.D.C. has consented to an application by the Trent Valley and High Peak Electricity Co. to supply current to Colton and Handsacre, by means of overhead cables.

A system of surface wiring for services to terrace houses, which reduces the cost by approximately one-third as compared with underground cables, is being tried out at Hull.

Mr. C. H. Yeaman, city electrical engineer, Stoke-on-Trent, reports that the extensions at the central power house are nearing completion and that the official opening can take place shortly.

Shoreditch (London) Electricity Committee is to set up an installation department under the control of the Borough Electrical Engineer. The work is at present being carried out, under agreements, by four contractors.

Glasgow Electricity Committee is to instal additional switchgear at a cost of £1 144 16s. at sub-stations at Maxwell Park, Norham Street, Otago Street, and Dunlop Street.

Extensions contemplated by Maidenhead Electricity Committee include the completion of an e.h.t. ring main round the northern half of the area of supply, and the installation of a 96 kW rectifier plant in a brick-built sub-station. The estimated cost is £8 364.

Eston U.D.C. has concluded an agreement under which the E.L.M.A. will supply lamps at special net prices, subject to 1 000 lamps being ordered and delivery taken over eight weeks from the date of order, these lamps to be given to consumers taking supply through prepayment meters under the Council's rental wiring scheme.

Battersea (London) Electricity Committee recommends extensions of the Borough Council's electricity undertaking, estimated to cost £43 756, of which £29 973 is for mains for private consumers. Six wards of the borough, hitherto without mains, are affected, and it is also proposed to convert gas lamps in a number of the streets of those wards.

Rotherham Electricity Committee recommends that for h.t. current the consumer shall have the option of adopting, as an alternative to the flat rate charges, a two-rate tariff comprising a fixed charge of £4 per annum per kVA of maximum demand plus ¼d. per kWh, subject to a coal clause, which will make the total charge, under present prices, 10% above the above-mentioned rates.

The Mayor of Brighton, Ald. H. J. Galliers, members of the T.C., and others visited the Corporation's electricity works at Southwick on October 12th to see the Mayoress start a new 15 625 kW Richardson-Westgarth turbo-alternator. The new equipment also includes Yarrow boilers, bunkers, coal handling plant, switchgear, etc. The generator, which runs at 3 000 r.p.m., has cost £53 840.

Mr. J. K. Brydges, borough electrical engineer, Eastbourne, has submitted to the Electricity Committee proposals for the installation of an illuminated fountain in each of the two large carpet gardens on the sea front. An interesting feature will be an interior colour-changing device over special reflectors in the water. Fairy lamps strip-lighting around the border of the carpet gardens and the use of reflectors in the ceiling of the bandstand equipped with amber colour screens are also proposed. For the Wish Tower slopes, plain standards with two rings, similar to those now employed on the front, and the top fitted with Paisley lanterns are suggested. The cost of the material for this scheme would be £700.

An offer has been made by the Yorkshire Electric Power Co. to purchase Wakefield Corporation's electricity undertaking for £250 000, plus a substantial sum. The offer was made to Ald. G. H. Sherwood, M.P., who has asked the company to repeat it through the usual channel. The company suggests that the ratepayers would get a cheaper supply of electricity from the company and that the acceptance of its offer would be a satisfactory alternative to borrowing money to cover the loss sustained, or to be sustained, by the default of Corporation and General Securities, Ltd., in respect of the issue of the Wakefield 4½% stock. The Corporation, however, decided on Tuesday to promote a Bill in Parliament to authorise the borrowing of the necessary money, and to apply to the Minister of Health for sanction to borrow £250 000.

COOKER COMPETITION RESULT.

In our issue last week (page 462) details were given of an interesting cooker competition, operated at the Brighton Electrical Exhibition by Messrs. Galliers, in conjunction with the Credenda Conduits Co., Ltd., in which visitors were asked to estimate the cost of cooking definite quantities of food for a family for a period of one week, with electricity at 1d. per kWh.

The actual cost, ascertained at the close of the exhibition was 2s. 3·1d. The number of entries totalled nearly 1 000, and though no competitor gave the exact figure, three people estimated a price of 2s. 3d. The estimates varied widely, some being as high as £1 9s. 6d., and others only a few coppers.—but the average of the serious entries was around 5s., which suggests that many people think electric cooking is more than twice as costly as it actually is.

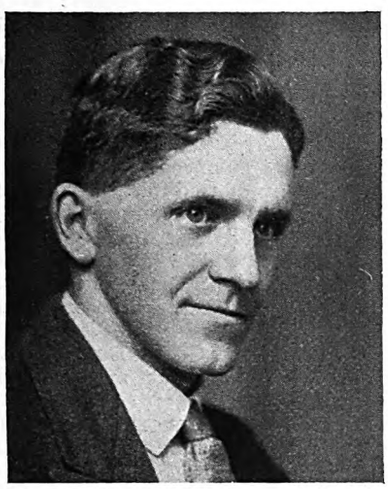
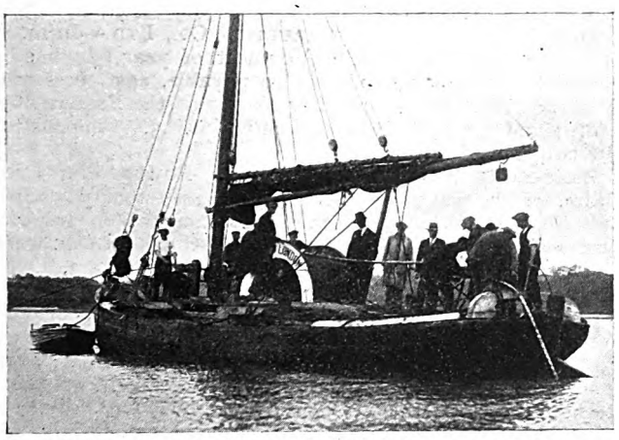
ELECTRICAL NEWS IN PICTURES.



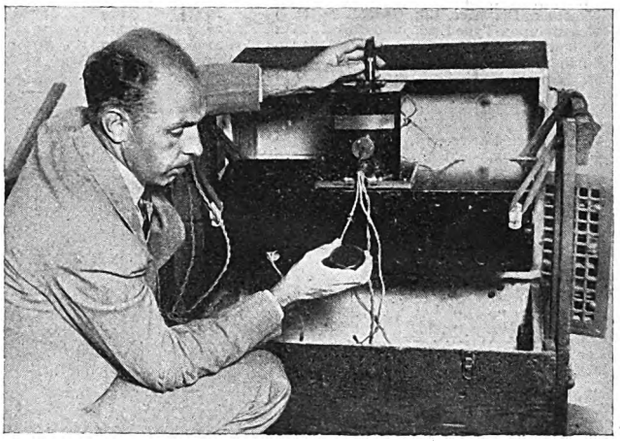
Mr. Howard Long who, as already announced, has resigned his position of manager of the illumination department of Metro-Vick Supplies to take up an appointment with Benjamin Electric, Ltd.

Mr. T. Trimnell, who has acted as solicitor and secretary of the National Register since its inception, has resigned. He will, however, continue to act in a consultative capacity. See page 502.

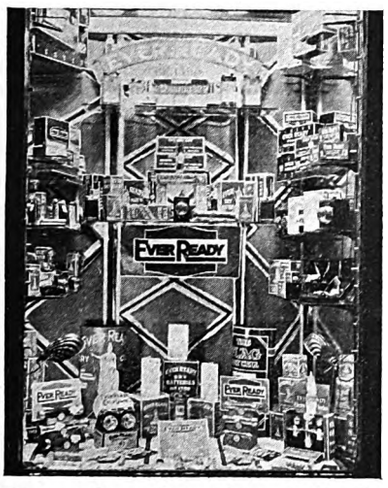
Mr. S. E. Monkhouse has been with the Newcastle-upon-Tyne Electric Supply Co. for twenty-five years and, as announced on page 502, has been appointed chief assistant to the general manager.

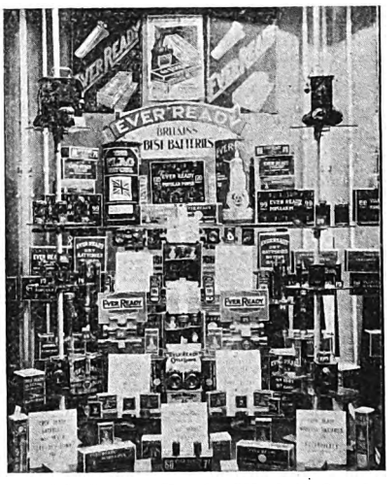


A 3 000 V cable was last week laid between Appledore and Instow across the mouths of the rivers Torridge and Taw, and the "cable ship" used in the proceedings is here seen approaching the Instow side.



An electrical device for use by aircraft which, it is claimed, will record the height of the craft above the ground. Its operation is said to be dependent upon sound waves controlling microphone currents.





We reproduce above three of the windows which were awarded first prizes in connection with "Ever-Ready Week," October 7th–12th. That on the left shows one of the windows of Pollock and Co., 222, Argyle Street, Glasgow, while in the centre is the window of Mr. T. M. Kingdon, 97, High Street, Winchester. Hardy Bros., Ltd., of Commercial Street, Hereford, were responsible for the window on the right. A further first prize winning window is reproduced on page 513, while the full list of electrical prize winners is given on page 502.

COMPANY NEWS.

Few Changes in Electrical Market—Manufacturing Interests Variable—Electricity Supply Descriptions Mainly Steady—B.I. Cables Improve—London "Underground" Report.

CHANGES in our electrical share price quotations compared with those ruling a week ago are not numerous. Business has continued active in Cables and Wireless issues, the "B" stock at 52½ showing a fall of 5 points, but the "A" on balance being only a point down at 84. Marconi Marine shares are 2s. 6d. lower at 47s. 6d. In the manufacturing section, British Insulateds are 1s. 3d. to the good at 82s. 6d., and Thomson-Houston preference 3d. at 23s. 3d. The other favourites have been weak, under the lead of General Electrics, which have lost 5s. Henleys have shed 2s. 6d. and Siemens 1s. 3d. English Electrics have dropped from 8s. 1½d. to 7s. 6d. County of London Supply ordinary have fallen 1s. 6d. to 54s.

SIMMS MOTOR UNITS, LTD.—Ord. sh. transfer books are closed until Nov. 1, inclusive.

ISLE OF WIGHT ELECTRIC LIGHT AND POWER CO., LTD.—Intm. div. of 8% p.a., tax free, is announced.

JAMAICA TELEPHONE CO.—It is reported that the company's undertakg. is being acquired by a British syndicate.

RIVER PLATE ELECTRICITY CO., LTD.—Intm. div. 3%, less tax, on ord. shs. (same as last year), will be payable on Nov. 1.

ANGLO-PORTUGUESE TELEPHONE CO., LTD.—Intm. div. of 3%, less tax (same as last year), will be payable on Nov. 15 (coupon No. 50).

UNDERGROUND ELECTRIC RAILWAYS CO. OF LONDON., LTD.—Int. for half-year ending Nov. 14 on 5% 1st mtge. deb. stk. will be payable on Nov. 15.

COMPANIA HISPANO-AMERICANA DE ELECTRICIDAD.—Company announces that there is no foundation for rumours that it is about to increase its capital.

NORTH METROPOLITAN ELECTRIC POWER SUPPLY CO.—Ord. sh. transfer books will be closed from Oct. 28 to Nov. 9, inclusive, for preparatn. of warrts. for intm. div. payable Nov. 15.

CALCUTTA ELECTRIC SUPPLY CORPORATION, LTD.—Intm. div. of 5%, actual, for half-year ended June 30, 1929, on ord. shs. will be payable on Nov. 15, income tax being deducted at rate of 2s. in £.

SHANGHAI ELECTRIC CONSTRUCTION CO., LTD.—Intm. div. at rate of 5%, actual, tax free, on acct. of year 1929 has been declared on sh. cap., and will be payable, agst. presentatn. of coupon No. 38, on and after Nov. 1 at the Eastern Bank, Ltd., 2 and 3, Crosby Square, London, E.C.3. Coupons to be left two clear days.

BARCELONA TRACTION, LIGHT AND POWER CO., LTD.—Hldrs. of sh. warrts. representg. 7% non-cum. participatg. pref. shs. can obtain a sheet of new coupons, in respect of future divs., on surrender of the talon attached to sh. warrts. to the Canadian and General Finance Co., Ltd., 3, London Wall Bdgs., London, E.C.3.

STOTHERT AND PITT, LTD.—Tradg. pft. for year ended June 30, 1929, £35 204, after providg. for income tax, agst. £30 364. Pref. div. of 5% absorbed £3 191; to res., £7 000, agst. £7 500; income tax res., £6 000 (same), written off freehold premises acct., £3 000, agst. nil. Ord. div. 10%, less tax, for year, agst. 6%. Fwd. £5 411, agst. £4 726.

COUNTY OF DURHAM ELECTRIC POWER SUPPLY CO.—Sales and meter and other rentals for 1928, £308 224. Energy purchased in bulk cost £278 689, balance to net rev. acct. was £29 535, plus blce. from last acct. £30 136, less div. paid £27 546. Deferred payments totalled £9, div. payable £31 088 and carry forward £1 028.

AMERICAN TELEPHONE AND TELEGRAPH CO.—Earngs. for nine months ended Sept. 30, 1929, $199 960 370, against $171 724 990 for correspondg. period of 1928. Exes., includ. taxes, at $59 412 976, leavg. net earngs. $140 547 394, agst. $120 911 236. Int., $19 720 460, agst. $16 393 849; divs., $86 648 958, agst. $76 542 747, leavg. a surplus blce. $34 177 976, agst. $27 974 640. Approximately 635 000 telephones and $275 000 000 worth of plant and equipmt. were added to Bell system during period.

NEW AMERICAN RADIO CO.—General Motors announce that they are forming a new radio company associated with the Radio Corporation of America, the General Electric Co., and the Westinghouse Electric and Manufacturing Co. The company is to have a cap. of $10 000 000 preferred stock and one million shares of no par value stock. All companies concerned will continue independently. Wireless sets are being installed in Cadillac and La Salle automobiles, and will be installed in other General Motors vehicles later.

HERBERT MORRIS, LTD.—Pft. on tradg. for year ended July 31, 1929, £95 414, agst. £95 022, after provisn. for income tax, etc., £10 643, agst. £9 323. Div. recommended on ord. shs. makes total of 15%, tax free, for year (same as previous year). To res., £25 000, agst. £20 000. Fwd. £51 605, agst. £52 952. Increased works' facilities have enabled company to mfre. some parts of its products which hitherto have been purchased outside. Directors have decided to extend the new works, and this is now well on the way. Financial positn. is such that cost of extensns. can be readily met without callg. fornew money.

Digitized by Google

ATLAS LIGHT AND POWER Co.—Pft. for year ended March 31, 1929, £314 682, increase £13 775. Divs. for year on old pref. shs. absorb £154 000, agst. £131 470, and fin. div. of 3% on the ord. is recommended, makg. 5% for year (same as previous year). Fwd. £39 428, agst. £35 756. Company has during year disposed of its hldgs. in Argentine subsidiary companies to American and Foreign Power Co., though still retaing. its int. in elec. tractn. undertakgs. in Montevideo. Company is now carrying on business of a general investment trust, and to meet new conditions it is proposed to change its name to Atlas Electric and General Trust.

CENTRAL STATES ELECTRIC CORPORATION.—Net income, $22 739 000 (£4 547 800), equivalent to $3.08 p. sh. on average number of common shs. outstandg. during year, is reported for 12 months ended Sept. 30, compared with net income $6 319 000 (£1 263 800) for precedng. year, increase 261%. Total market value of Corporation's investmts. is approximately $340 000 000 (£68 000 000), or $210 000 000 (£42 000 000) in excess of book value, while valuable warrts. are held for purchase of common stk. of various companies at prices below present market level. Fresh cap. was raised for Corporation recently by issue of $25 000 000 (£5 000 000) 5½% debs. In past half-year Corporation's common stk. has been twice split—in April two for one, and in July three for one.

DRAKE AND GORHAM, LTD.—Net pft. for year ended June 30, 1929, after paymt. of all charges and makg. provisn. for contingencies, £8 220, plus £3 570 brt. in. Div. recommended, 5% for year; to gen. res., £2 500; fwd., £3 040. In spite of continuance of abnormal taxatn. and consequent trade depressn., which are responsible for somewhat reduced profits, developmts. to which reference was made last year have resulted in a rapidly increasg. turnover, and demand for company's h.t. switchgear is such as to necessitate the acquisitn. of larger works, the financg. of which is now under consideratn. Company has been entrusted with electrical equipmt. of many large bldgs., includg. new head offices of Martins Bank, extensive additns. to installatn. at Harrods Stores, Junior Carlton Club and Bedford College. The new Bank of England and Lloyds Bank head offices had not advanced sufficiently for much electrical work to be done in connectn. with these contracts durg. financial year.

New Companies.

VECTOR ELECTRICAL Co., LTD.—Cap., £1 000. To acquire business of electrical engineer now carried on by E. E. Walker as the "Vector Electrical Co.," at 40 Broadfield Road, Sheffield.

J. H. MASTERS (NEWCASTLE), LTD.—Cap., £1 000. Manufacturers of and dealers in talking machines, wireless and other instruments, etc. Permanent managing director: L. Freeman, 71, Blackett Street, Newcastle-upon-Tyne.

BELFAST RADIO AND ELECTRICAL Co., LTD.—Cap., £1 000. To take over from R. McFarland business of a wireless dealer, carried on by him as the Belfast Radio and Electrical Co. Reg. Office: 17, Queen Street, Belfast.

ALL BOXES, LTD.—Cap., £1 000. Manufacturers of wireless portable cases, h.t, battery containers, floating cones, and all apparatus relating to or incidental to wireless, etc. Reg. Office: 117, Central Street, London, E.C.1.

THE LEAD MARKET.

The market was again quiet last week, and according to James Forster and Co., prices, following the tendency in other metals, became easier, £23 being accepted for October, and £23 3s. 9d. for January. Later, prices improved again to £23 7s. 6d. The American price is unchanged at 6·90 cents. Closing prices on October 18th were £23 7s. 6d. for all positions, unchanged to 2s. 6d. per ton lower on the week.

WESTERN COUNTIES ELECTRICAL AND ENGINEERING Co., LTD., Yeovil.—Registered September 26th, £3 000 and £350 mortgages to Frome Selwood Permanent Building Society and A. M. G. Daniel, Frome, solicitor; charged on 18, Princes Street, Yeovil. *Nil. September 27th, 1928.

Satisfactions.

BOWYER-LOWE Co., LTD., London, W.C., electricians.—Satisfaction registered October 10th, all moneys, etc., registered November 14th, 1928.

DORIAN WIRELESS Co., LTD., London, W.—Satisfaction registered October 11th, £2 100, registered August 22nd, 1929.

London Gazette, etc.

Companies Winding-up Voluntarily.

HASLAM (G.) AND Co., LTD. By reason of its liabilities. October 15th. H. J. B. Feist, 12, Eaton Road, Leigh-on-Sea, Essex, appointed as liquidator.

REPRODUCTION, LTD.—By reason of its liabilities, October 11th, H. B. Keeping, of Falk, Keeping and Co., 18, Ironmonger Lane, London, E.C., chartered accountant, appointed as liquidator.

Winding-up Petitions.

ENTERPRISE MANUFACTURING Co., LTD. A petition for winding up has been presented by Max Weinbaum, 56, Amhurst Park, London, formerly trading as the Weinbau Incandescent and Electrical Co.; and is to be heard at the Assize Court, Kingston, Surrey, on Friday, November 22nd, at 10.30 a.m.

TRIOTONE, LTD.—A creditor's petition for winding-up has been presented by the Marconiphone Co., Ltd., Marconi House, Strand, London, wireless manufacturers, and is to be heard at the Royal Courts of Justice, Strand, London, on October 28th.

Bankruptcy Information.

CAMEROFF, Joseph, 147, Spencer Place, Leeds, electrical engineer, First meeting, October 31st, 11 a.m., Official Receiver's Office, 24, Lower Bond Street, Leeds. Public examination, November 12th, 10.30 a.m., County Court House, Albion Place, Leeds.

COLES, Allan James, 2A, Pinner Road, Harrow, Middlesex, electrical engineer and contractor. Receiving order, October 17th. Debtor's petition.

COTTRELL, Thomas Chapman, 31, Autumn Street, Burley Lodge Road, Leeds, electrician, trading as THOMAS COTTRELL. First meeting, October 31st, 11.30 a.m., Official Receiver's Office, 24, Lower Bond Street, Leeds. Public examination, November 26th, 10.30 a.m., County Court House, Albion Place, Leeds.

TURNER, Ivy (Miss), 103A, Little Ilford Lane, Manor Park, E.12, wireless dealer. Receiving order, October 14th. Debtor's petition. First meeting, October 25th, 11 a.m., and public examination, November 19th, 11 a.m., Bankruptcy Buildings, Carey Street, London, W.C.2.

WRIGHT, Ronald Reginald, trading as WRIGHT BROS., 36, Normanton Road, Derby, wireless dealer. Receiving order, October 17th, debtor's petition. First meeting, October 31st, 11 a.m., Official Receiver's Offices, 22, Regent Street, Park Row, Nottingham. Public examination, November 26th, 11 a.m., Court House, 20, St. Peter's Churchyard, Derby.

Notice of Dividend.

WILMINGTON, Granville, 75, Railway Street, Nelson, electrical and radio engineer. First and final dividend, 2s. 2½d. per £, payable October 25th, Official Receiver's Office, District Bank Chambers, Blackburn.

Application for Discharge.

LAMBERT, Frederick Victor, 27, Parrock Street, Gravesend, Kent, electrical contractor, trading as LAMBERT AND CURLEY. Hearing, November 13th, 11 a.m., Court House, Eastgate, Rochester.

Partnerships Dissolved.

AUTO ELECTRICAL SERVICE (Charles Victor COOPER and Henry James COOPER), electrical engineers, Garrick Place, Wellington Road South, Stockport, by mutual consent as from October 17th, 1929. Debts received and paid by H. J. Cooper.

STANWORTH AND SHORROCK (Clifford Parker STANWORTH and Thomas William SHORROCK), electrical and radio engineers, 1, Rainhall Road, Barnoldswick, Yorks, by mutual consent as from August 9th, 1929. Debts received and paid by T. W. Shorrock, who continues the business.

OVERHEAD LINE EQUIPMENT

THE rapid development of E.H.T. overhead transmission and distribution systems has increased the demand for an efficient means of limiting the area of disturbance caused by faults or short circuits.

For thirteen years we have been manufacturing at Glasgow an efficient fuse for pressures up to 132,000 v. and fuse ratings up to 400 amps. The principle of operation is the same as when we first made it, but the mechanical construction has been improved as the result of this experience. Satisfactory operation is proved by the fact that various Power Companies who adopted the fuse thirteen years ago are still installing them.

OWING TO THE SMALL MASS OF MOVING PARTS, A LARGE GAP IS RAPIDLY INTRODUCED, AND WITH THE HIGH DI-ELECTRIC STRENGTH OF THE LIQUID IN THE GAP, ENSURES THE CERTAIN ACTION OF THE FUSE.

ELECTRIC CONTROL

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

317 134 W. R. Westhead. Sound reproducing or transmitting instruments. (7/1/29.)
296 771 Landis and Gyr Soc. Anon. Driving system for induction-measuring instruments. (9/9/27.)
316 908 H. A. Whitehorn (Bell Telephone Laboratories, Inc. (in part)). Electrical conductors. (30/4/28.)
316 909 Paragon Rubber Manufacturing Co., Ltd., and G. W. Croot. Plug-and-socket and like electrical connections particularly for panels of wireless apparatus. (1/5/28.)
289 887 Siemens and Halske Akt.-Ges. Diaphragms, more particularly for loud speakers and the like. (6/5/27.)
316 912 Standard Telephones and Cables, Ltd., J. H. E. Baker, and E. P. G. Wright. Automatic or semi-automatic telephone systems. (3/5/28.)
316 915 F. G. Bell. Audible warning and signalling devices. (3/5/28.)
316 921 R. N. Wellington. Combined switch and condenser for wireless aerials. (5/5/28.)
316 923 South Metropolitan Gas Co., and J. H. Smith. Electric ignition apparatus for incandescent gas burners. (5/5/28.)
291 025 Dr. R. Ambronn. Apparatus for electrically exploring the ground or soil. (24/5/27.)
317 120 Standard Telephones and Cables, Ltd., E. P. G. Wright, J. H. E. Baker, and A. H. Cameron. Automatic and semi-automatic telephone systems. (10/5/28.)
290 257 Weitverkehrskabel Ges. Electric cables. (11/5/27.)
290 303 E. Binard. Transmitters for use in wireless signalling. (12/5/27.)
317 130 V. Herold. Secondary electric batteries. (12/5/28.)
317 137 C. H. R. Gower and O'Brien and Partners, Ltd. Electrolytic deposition of chromium. (15/5/28.)
317 143 J. L. Baird and Television, Ltd. Television or like systems and apparatus. (15/5/28.)
317 149 Siemens Bros. and Co., Ltd., F. Baker and E. R. Garrod. Electromagnetic devices. (19/5/28.)
317 151 India Rubber, Gutta Percha and Telegraph Works Co., Ltd., and W. G. Spinks. Electrical indicators. (24/5/28.)
317 153 M.-O. Valve Co., Ltd., and J. W. Ryde. Electric gas-discharge rectifiers. (25/5/28.)
291 383 Associated Electrical Industries, Ltd. Internal-combustion engine electric generator power units. (31/5/27.)
317 158 J. Neale. Construction of selenium bridge or cell. (31/5/28.)
317 160 S. Melton. Power-factor control for electric power-distribution systems employing motor generators. (2/6/28.)
317 167 W. Holmes and Ferranti, Ltd. Electric switches. (9/6/28.)
317 169 F. W. Lanchester. Field magnets or microphones, loudspeakers, and the like. (12/6/28.)
317 174 Igranic Electric Co., Ltd., and D. Sinclair. Transmitters for radio telephony.(19/6/28.)
317 175 A. Preston. Sunk switches as used in electric wiring systems. (21/6/28.)
292 563 British Thomson-Houston Co., Ltd. Electron-discharge devices. (22/6/27.)
317 178 H. Busse. Starting arrangements for electric discharge devices. (22/6/28.)
294 874 Brandes, Ltd. Sound-reproducers. (30/7/27.)
317 186 H. Panzetta. Electric circuit-controlling apparatus. (27/6/28.)
294 877 W. Kunze and Radiofrequenz Ges. Loudspeaker system. (30/7/27.)
317 190 J. Sieber. Illuminating display or advertising apparatus. (3/7/28.)
317 192 F. E. Bancroft and Associated Electrical Industries, Ltd. Fluid-actuated relays. (5/7/28.)
294 476 National Carbon Co., Inc. Vents for electric battery cells. (23/7/27.)

Applications for Patents.

July 17th.

21 984 F. Rother. Gasfilled illuminating tubes. (18/7/28, Germany.)
21 955 Standard Telephones and Cables, Ltd. (C. E. Stevens and A. Mamor). Telephone systems.
21 953 Standard Telephones and Cables, Ltd. (Western Electric Co.). Radio telegraph receiving systems.
21 996 Telefunken Ges. fur Drahtlose Telegraphie. Signal-released alarm devices. (6/8/28, Germany.)
21 922 G. Wilkinson. Electric thermostats.
22 018 E. Williams. Railway signals and train control mechanism. (18/10/28.)
22 003 Wireless Pictures (1928), Ltd. Systems of facsimile transmission and reception.

July 18th.

22 042 P. F. Allan and Macintosh Cable Co., Ltd. Electric cables.
22 083 Associated Electrical Industries, Ltd., and E. N. Johnson. Power systems.
22 086 Associated Electrical Industries, Ltd. Signalling systems, etc. (18/7/28, U.S.)
22 065 P. Brabant. Formation of insulating coatings on electrical apparatus. (18/7/28, Belgium.)
22 090 British Thomson-Houston Co., Ltd. (Victor X-ray Corporation.) X-ray apparatus.
22 105 H. A. Bumke Ges. Insulating carbon rods of dry batteries. (8/4/29, Germany.)
22 082 E. H. Croft, General Electric Co., Ltd., and A. C. Price. Electric power supply systems.
22 156 W. Engelke. Light sensitive cells.
22 088 General Railway Signal Co. Railway Signalling. (18/7/28, U.S.)
22 089 General Railway Signal Co. Train control systems. (18/7/28, U.S.)
22 081 Hermsdorf Schomburg-Isolatoren Ges. High tension condensers. (15/9/28, Germany.)
22 113 Hermsdorf Schomburg-Isolatoren Ges. High tension condensers. (31/12/28, Germany.)
22 110 L. L. von Kramolin. Thermionic valve circuits. (27/7/28, Germany.)
22 145 A. H. Moorhouse. Connector for securing branch wires to electric cables.
22 049 H. H. Seddon and H. W. Sykes. Electrical indicating apparatus, etc.
22 131 Telefunken Ges. fur Drahtlose Telegraphie. Thermionic valves, etc. (27/7/28, Germany.)
22 084 Westinghouse Lamp Co. Coated cathodes for electron discharge devices. (18/7/28, U.S.)
22 085 Westinghouse Lamp Co. Electron emission materials. (18/7/28, U.S.)
22 161 A. E. White (Claude Neon Lights, Inc.) Running light signs.
22 162, 22 163, 22 164 A. E. White (Claude Neon Lights, Inc.) Tube lighting systems.
22 165 A. E. White (Claude Neon Lights, Inc.). Stabilising light emitted by discharge tube lamp.
22 166 A. E. White (Claude Neon Lights, Inc.). Beam beacons.
22 167, 22 168 A. E. White (Claude Neon Lights, Inc.). Vacuum tubes.

July 19th.

22 216 W. Becker. Arrangement for transforming and rectifying electric currents.
22 219 Benjamin Electric, Ltd., and H. T. Harrison. Electric switches.
22 269 F. M. Best. Electric amplifiers for sound reproducing purposes.
22 270 F. M. Best. Variable condensers.
22 271 F. M. Best. Radio receiving apparatus.
22 250 Electrical Research Products, Ltd. Electro-optical systems, etc. (24/7/28, U.S.)
22 240 Electrolux, Ltd. (Platen-Munters Refrigerating System Aktiebolag). Cooling devices, etc.
22 190 E. Felton. Electromagnetic time keeper.
22 305 V. C. From, A. W. Larsky, and C. D. Rowley. Electric lamps.
22 198 S. S. Guy. Electrically driven vehicles.
22 248 W. W. Hancock. Electric switches for internal combustion engines, etc.
22 191 F. H. Reeves and Revo Electric Co., Ltd. Electric lamp holder, etc.
22 187 E. J. Targett and A. T. Withers. Electric switches.
22 293 Telefunken Ges. fur Drahtlose Telegraphie. Potential supply devices. (19/7/28, Germany.)
22 306 Westinghouse Lamp Co. Electron discharge devices. (31/7/28, U.S.).
22 258 H. J. Thomson. Dynamo-electric machinery.

July 20th.

22 385 Allgemeine Elektricitats Ges. Coupling device for transmitting electrical energy to conductors. (21/7/28, Germany.)
22 343 L. Blundell and W. H. Curtis. Electrical sound reproducing apparatus.
22 344 L. Blundell and W. H. Curtis. Frame aerials.
22 370 British Insulated Cables, Ltd., J. L. Packer, and B. Welbourn. Electric cables.
22 371 British Insulated Cables, Ltd., and J. L. Packer. Electric cables.
22 316 H. W. Headland. Electric cooking stove.
22 351 W. G. Moore. Arc electrodes for therapeutic treatment.
22 391 E. R. Ritter, and Scherbuis and Ritter. Electric switch. (7/9/28, Germany.)
22 362 Standard Telephones and Cables, Ltd. Remote indicator and supervisory system.
22 321 H. K. Turner. Electric comb.
22 353 H. C. Tuttle. Telephone mufflers.

July 22nd.

22 509 Aeonic Radio, Ltd., and E. V. Kayley. Radio receiving apparatus.
22 515 Akt. Ges. Brown, Boveri et Cie. Pole-type switches. (21/7/28, Germany.)
22 409 E. Allen. Electrically heated vessels.
22 500 J. L. Baird. Television systems, etc.
22 475 R. Blackburn, L. C. Pocock and Standard Telephones and Cables, Ltd., and H. J. Turton. Telephone instruments.
22 444 British Thomson-Houston Co., Ltd. Electrical discharge devices. (20/7/28, U.S.)
22 445, 22 446 British Thomson-Houston Co., Ltd. Current regulating devices. (20/7/28, U.S.)
22 447 British Thomson-Houston Co., Ltd., F. A. Fossey and D. H. Graham. Electric motors.
22 506 W. Isch. Electric tinder box.
22 471, 22 472. T. S. Kemble. Electric resistances.
22 398 J. F. Lister and Veritys, Ltd. Cooling enclosed dynamo electric machines.
22 480 Oldham and Sons, Ltd., and W. W. Wilde. Galvanic batteries.
22 469 Siemens-Schuckertwerke A.G. Synchronising synchronous machines. (2/8/28, Germany.)
22 493 Siemens und Halske A.G. Impulse transmitters for telephone systems, etc. (21/7/28, Germany.)
22 476 Standard Telephones and Cables, Ltd. Electric wave amplifying and translation systems. (8/8/28, U.S.)
22 491 Telefunken Ges. fur Drahtlose Telegraphie. Radio signalling. (20/7/28, Germany.)
22 500 Television, Ltd. Television systems, etc.
22 454 Thermal Syndicate, Ltd. (Deutsch Englische Quarzschmelze Ges.) Mercury vapour lamps.
22 507 Westinghouse Lamp Co. Coated cathode for electron discharge devices. (20/7/28, U.S.)

COMING EVENTS.

Friday, October 25th (to day).

Institution of Railway Signal Engineers.—Criterion Restaurant, London Annual dinner.

Birmingham Electric Club.—Grand Hotel, Colmore Row, Birmingham. Lecture by Mr. T. A. Windibank on "Motor Users and the Frequency Change." 7 *p.m.*

Junior Institution of Engineers.—39, Victoria Street, London, S.W. Paper by Mr. H. Bruff on "Electric Welding as Applied to Bridges and other Structures on the L. and N.E. Railway." 7.30 *p.m.*

Institution of Electrical Engineers (West Wales-Swansea Sub-Centre).—Corporation Electrical Showrooms. Chairman's address by Mr. J. W. Burr. 6 *p.m.*

Monday, October 28th.

Electrical Contractors' Association (Ealing Sub-Branch).—Ordinary meeting.

Institution of Electrical Engineers.—Institution, Savoy Place, Victoria Embankment, London. Informal meeting. Discussion on "Systematic Research by Industrial Undertakings." (Opened by the President.) 7 *p.m.*

Institution of Electrical Engineers (North-Eastern Centre).—Armstrong College, Newcastle-on-Tyne. Chairman's address by Mr. B. A. Robinson. 7 *p.m.*

E.L.M.A. Lighting Service Bureau.—15, Savoy Street, Strand, London. Twentieth Illumination Design Course.—Lecture II, by Mr. F. Marsh on "Illumination Design." 7.30 *p.m.*

Electrical Association for Women (Bristol and District Branch).—New Physics Theatre, Bristol University. 8 *p.m.* Lecture by Dr. A. P. M. Fleming on "Milestones in the Progress of Electricity." 8 *p.m.*

Tuesday, October 29th.

Institution of Electrical Engineers (East Midland Sub-Centre).—College of Science and Technology, Leicester. Paper by Sir C. A. Parsons, F.R.S., on "Direct Generation of Alternating Current at High Voltages." 6.45 *p.m.*

Institution of Electrical Engineers (North Midland Centre).—Hotel Metropole, King Street, Leeds. Chairman's address by Mr. T. Roles. 7 *p.m.*

Association of Supervising Electrical Engineers.—E.L.M.A. Lighting Service Bureau, 15, Savoy Street, Strand, London. Lecture by Mr. W. J. Jones on "Various Applications of Indirect Lighting, with Special Reference to Public Buildings."

Wednesday, October 30th.

Electrical Contractors' Association (Croydon Sub-Branch).—Ordinary meeting.

Electrical Contractors' Association (Belfast Branch).—5, Bedford Street. Ordinary meeting. 3.30 *p.m.*

Friday, November 1st.

Institution of Mechanical Engineers.—Storey's Gate, St. James's Park, London. Thomas Hawksley Lecture, by Prof. H. L. Callendar, F.R.S., on "Critical Relations Between Water and Steam." 6 *p.m.*

Institution of Electrical Engineers (Meter and Instrument Section).—Institution, Savoy Place, Victoria Embankment, London. Chairman's inaugural address by Mr. E. W. Hill. 7 *p.m.*

Saturday, November 2nd.

Electrical Power Engineers' Association (West Yorkshire Section).—Great Northern Hotel, Leeds. Seventh annual dinner. 5.30 for 6 *p.m.*

Current Topics.

A Fine Address.

IT was singularly appropriate that a Presidential Address which was heard simultaneously by local centres throughout the country by the aid of recent developments in electrical communication, should have dealt almost exclusively with this aspect of electrical activities. But apart from the novelty of the circumstances under which COL. PURVES'S remarks were delivered, the subject matter was of very great interest. Some of the developments that have been made in communications engineering during the past few years have been sufficiently spectacular to break down the mistaken prejudices of those electrical engineers who deemed themselves a race apart from the "weak current" men, but, for all that, some of the lesser-known, but still remarkable, achievements in telephony and allied communication systems to which the President referred must have surprised many of his hearers, and prepared their minds for acceptance of the undoubted fact that the work of the communications engineer, by reason of the intricacy of the problems which confront him, and the delicacy of the means and methods which he has devised for dealing with them, will bear comparison with that of any other branch of electrical engineering. This work is, however, of more than mere comparative interest to the "heavy" electrical engineer, and the President gave several illuminating examples of its bearing on other branches of electrical endeavour, as instanced by the contributions which the study of telephony has made to alternating current transmission theory. It is also interesting to note that the last I.E.E. President to deal with electrical communications was Mr. FRANK GILL, and that the remarkable recent progress in international telephonic communication now recorded by COL. PURVES is very largely due to and founded on Mr. GILL'S 1923 Address.

I.E.E. Lighting.

IN spite of repeated assertions by those best qualified to judge that the lighting of the lecture theatre of the Institution of Electrical Engineers was the embodiment of lighting ideals, we have always experienced a species of eye-strain mingled with a degree of melancholy not strictly in keeping with the earliness of the hour whenever we have sat in that dignified hall. At last week's inaugural meeting, however, we noticed a change, as we thought for the better, and it later transpired that the increased sense of well-being, then felt for the first time, was due to the combined labours of Messrs. PATERSON and YOUNG, who have spent a considerable amount of time on the problem. Assuming that the former lighting was technically perfect, which we very much doubt, the above-named gentlemen seem now to have succeeded excellently well in reconciling perfection with comfort.

Brighter Seaside Resorts.

SCHEMES costing many thousands of pounds will be considered by south coast seaside authorities during the next few months: Open-air bathing pools, municipal dance halls, pleasure gardens, and promenade extensions are among the improvements to be considered. There is growing realisation at such resorts of the attractive value of spectacular schemes of electrical illumination, and, with Blackpool as a shining example of properly exploited ornamental lighting, it should not be difficult for electrical firms to play a practical part in the provision of a brighter seaside for next season.

Another Gas Attack.

ALL who admire enterprise, even in a mistaken direction, will pay ungrudging tribute to the excellence of the full-colour advertising of gas which appeared in the special Printing Number of "The Times" on Tuesday. The full page coloured picture by CLIVE GARDINER, with a caption which somewhat equivocally stated that "Gas is banishing the curtain of smoke that keeps the

Digitized by Google

sunshine from our cities" was a sheer delight to the eye. Another colour page, sponsored by the Gas Light and Coke Co., had a well-written and delightfully illustrated account of the applications of gas in a printing works and there was an article on the uses of gas in printing which mentioned, incidentally, that "to-day almost any printer will tell you that he prefers to work by gaslight rather than by any other artificial illuminant." As those responsible for collective electrical propaganda seem to have neither the money nor the inclination to make a show on an occasion of this sort, electricity only received incidental mention in the issue on the machine driving side. There are numerous other possible electrical applications in typesetting, stereotyping and a variety of printing operations requiring heat. It certainly looks as if industrial electric heating specialists will need to pay more attention to this field.

The Shannon Scheme.

THE good progress which is being made with the Shannon Electricity Scheme is indicated by the fact that last week the Irish Free State Electricity Supply Board took over from the Minister for Industry and Commerce the whole of the electrical and mechanical equipment at the Ardnacrusha power station. The Supply Board has already taken over the 38 kV transmission system and the 10 kV lines on the Limerick Waterford-Cork-Tralee-Limerick route, which means that the Ardnacrusha station can now go into operation and transmit energy over the network south of Dublin to Limerick, while the civil engineering side of the work is being completed. For this supply scheme to become an economical proposition, 110 000 000 kWh will have to be sold per annum, as against the present consumption of the whole of the Irish Free State of 68 500 000 kWh, though the price per kWh on which the Supply Board has based this calculation is not yet known. Ireland may rest assured that the eyes of the electrical world are watching with sympathetic, if critical, attention, for apart from the fact that the scheme was the first real constructive task undertaken by the Free State Government, the means adopted for developing sales of energy by nearly 50% are likely to prove of more than local interest.

Britain and the South African Market.

THE views already expressed in these columns regarding our neglect of local requirements in the overseas markets, received further substantiation last week when Mr. KARL GUNDELFINGER, president of the Associated Chambers of Commerce of South Africa, spoke at the annual congress at Capetown. In reference to South African imports it was stated that the partial failure of the British manufacturers in maintaining their share of trade was largely due to their unwillingness to meet South African needs, as against their foreign competitors. The British manufacturer enjoys not only certain preferential tariffs in dealing with South Africa but more important still, he also enjoys a considerable amount of good will, and if he does not secure the larger share of patronage he must, in the words of Mr. Gundelfinger, "search nearer home for the causes."

Sussex Again!

HAVING come to an end of arguments intended to show that the erection of overhead lines would desecrate the amenities of the Sussex Downs, the anti-pylonists have changed their ground, if we are to attach any significance to the letter which LORD BUXTON contributed to Wednesday's issue of "The Times." In this remarkably worded statement, asking for an entirely new inquiry into the whole scheme, he claims that, apart altogether from the amenities of the downs and marshes, there is a strong case for delay and consideration. An effort is made to show that the scheme will not provide cheap electricity, and that even if it did, Sussex doesn't want it. The economic arguments now introduced emphasise the danger of a little knowledge in a wrong application, for while it is correct to point out that distribution (in which transmission should in this case be included) is far more costly than generating, the objectors to the Sussex scheme would automatically increase distribution costs to an entirely uneconomic level. Again it is pointed out that "neither the main lines nor the subsidiary lines can be tapped at any point whatever in their route from town to town." Although we have not yet got down to the tapping of main lines for very small loads, the position is not quite so bad as the above quotation suggests.

Australia and the Communications Company.

THE existence of a peculiar position between Australia and the Communications Company is revealed this week by Amalgamated Wireless (Australasia) Ltd. The Communications Company, it will be remembered, is the result of the merging of the chief cable and wireless communication interests in this country, and though it was believed that the Australian Commonwealth had a majority of shares in the Amalgamated Wireless Company, the balance sheet of the company, published this week, shows that this is not so. At the time of the merger the Amalgamated Wireless Company did not amalgamate, and though the Communications Company controls the traffic exchanged between England and all the Dominions both by cable and wireless, it does not control wireless communication *from* Australia. The position in short is that the Amalgamated Wireless Company can only transmit to this country or Canada with the consent of the Communications Company to receive, and though it is expected that the new Australian Government will remedy matters, Australia at the moment has no complete international service of her own.

Empire Trade.

AT a time when industrialists are seriously beginning to view trade problems internationally, special interest attaches to the efforts which are now being made to arouse enthusiasm for a British Empire trading policy. In these columns we have frequently drawn attention to the vast possibilities of the countries comprising the British Commonwealth of nations, both as sources of our raw materials and as consumers of our finished goods. The problem of welding the countries of the British Empire into one interdependent and largely self-sufficing economic unit is by no means as simple as it seems, but a most encouraging feature is the readiness of the Dominions to "buy British" if we will only give them the chance, or, in other words, provide the goods they want at competitive prices. An Empire trade policy should commend itself to everyone, for even the out-and-out internationalists should see in it an important step on the way to the realisation of their aim.

SLACKS VALLEY POWER STATION.

Constructional and Operating Features of Oldham's New Plant—Good Day-time Light in Boiler House—Obviating Use of Signalling Apparatus to Turbine Rooms.

THE new Slacks Valley power station of the Oldham Corporation Electricity Department, which was formally opened on October 16th, is conveniently situated on land adjoining the main line of the L.M.S. Railway from Manchester to Yorkshire on the west, and the Rochdale Canal on the east.

The entrance to the works is on the new Manchester-Chadderton arterial road. The area of the site is 34 acres, and the present generating capacity of the station is 37 500 kW. The whole site, however, is capable of ultimate extension to accommodate a total of 150 000 kW of plant.

Somewhat difficult problems of foundation construction were offered by the ground on which the station is built, but these have satisfactorily been overcome. The top surface was a layer of peat, with plastic clay and sand below, and necessitated the use of a large number of concrete piles for both the main building and the water cooling towers.

Facilities for coaling are good, as not only will it be possible to transport coal from the Lancashire coalfields by way of the Rochdale Canal, but two short siding connections to the L.M.S. Railway on the west side put the works in direct communication with any railway in the country.

Coal can, therefore, be delivered by rail or canal, the wagons being hauled and marshalled by means of a fireless locomotive and electric capstans over three tracks of rails, one of which passes over two railway-type weighing machines and the coal receiving hopper. Each wagon is weighed before and after emptying.

Coal is unloaded by means of two electrically-driven ram tipplers placed between the rails, and is discharged into the receiving hopper, whence it is carried by an automatic filler into an endless chain gravity bucket conveyor, capable of dealing with 80 tons of coal per hour, to the main storage bunkers in the boiler house, which have a total capacity of 900 tons.

A special feature of the coal handling plant is an auxiliary conveyor having a capacity of five tons of fine slack per hour, which is used for the recovery and return to the main bunkers of riddlings and fine coal which accumulate below the chain-grate stokers.

The first portion of the station consists of the turbine house, which is 143 ft. 6 in. long and 70 ft. wide, with a height of 47 ft. 6 in. to the crane rails and 60 ft. to the eaves of the roof.

Adjacent to, and parallel with, the turbine house is the switch house, which is divided into three floors; the circulating water pumps in the basement, circuit breaker room on the second floor, and control room on the third floor. The administrative offices are at the permanent end of the switch house.

Following normal practice, the boiler house is situated at right angles to the turbine house, and is 140 ft. long, and 120 ft. wide, with a height of 53 ft. to the eaves.

The boiler feed pump house is situated between the boiler house and the turbine house, and is parallel to the turbine house.

The buildings are of steel framework with brick filling, the exterior sides of the walls being faced with Accrington brick and Yorkshire stone, and above the turbine house floor level the inside walls are finished with glazed grey and white tiles.

Boiler House Lighting.

Every effort has been made to provide extremely good day-time lighting, and this is a particularly noticeable feature of the boiler house.

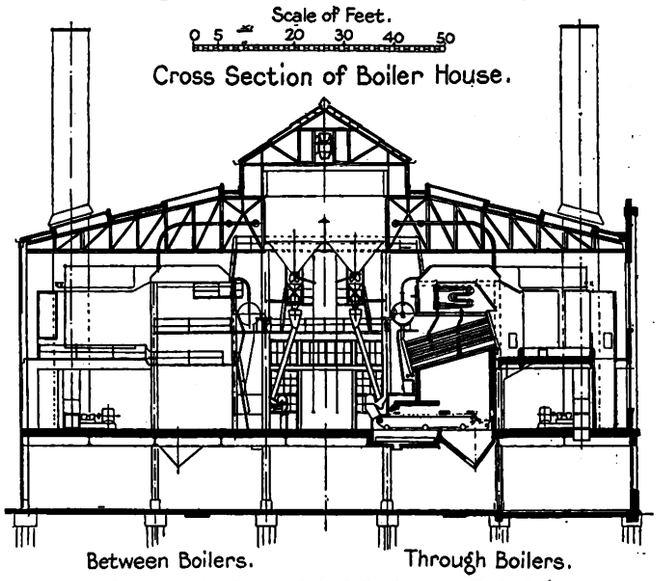
The basement of the boiler house is arranged at ground level. A horse-shoe shaped track provided enables the ashes to be directly removed from the hoppers beneath the boilers by motor or railway wagons and tipped on the site, the contour of which lends itself to this method of disposal for a considerable period.

The steam raising plant consists of eight cross-tube, marine type, water-tube boilers, each capable of evaporating 50 000 lb. of water per hour under normal working conditions.

The plant is constructed to operate at a working pressure of 295 lb. per sq. in., and superheaters are provided capable of imparting a final temperature to the steam of 700 deg. F. at the stop valve.

Each boiler is set singly, is entirely self-contained and enclosed in steel casing. Each unit is equipped with a vertical, cast-iron, steel cased economiser, having an effective heating surface of 4 500 sq. ft., electrically driven induced d aught fan, and a steel chimney, 7 ft. in diameter and 80 ft. high. The flue gases leaving the economisers either pass through the induced draught fan into the steel chimney or can be by-passed to the chimney direct.

In order to provide as much natural light as possible, and



A cross-sectional view of the boiler house at Slacks Valley.

to secure ease of maintenance, the economisers have been placed immediately behind the boilers on an auxiliary floor, and the induced draught plant has been arranged immediately underneath the economisers at firing floor level.

The coal from the main bunkers passes through two 2 cwt. "Avery" coal weighing machines and traversing type chutes to the stoker hoppers.

Boiler Plant.

The boiler furnaces are fitted with automatic mechanical chain-grate stokers, each boiler having two grates with a total grate area of 324 sq. ft. per furnace.

The stokers are arranged to operate under simple induced draught conditions, but arrangements have been made so that the necessary closing-in plates can be readily added to the plant at a later date should it be considered desirable to instal forced draught and air heating plant for operating the stokers under balanced draught conditions.

Steam soot blowers are provided for each boiler and each economiser. A set of instruments to assist the staff in obtaining the highest efficiency from the plant has been provided for each boiler.

The boiler feed pumps are placed in the pump house, which lies, as previously noted, between the boiler house and the turbine house. Six pumps are provided—four being electrically driven and two steam turbine driven—and these have an aggregate capacity of 95 000 gallons per hour. The flow of feed water to boilers is controlled automatically by eight "Copes" feed water regulators.

The exhaust steam from each turbine driven feed pump is led to a feed water heater which is installed in the feed pump suction.

Four condensate surge and make-up water tanks are erected in the upper portion of the pump house. Under ordinary working conditions the extraction water passes direct from main condensers to the feed pumps and thence back to the boilers.

Over one of the tanks a "Lea" recorder is erected. This can be brought into operation as desired by suitably arranged by-pass valves.

The tank at the north end of the pump house can be isolated at any time, and any turbine can be put on load under test conditions. The discharge from this tank can be passed to the tank erected on a weighbridge on the pump house floor, where the whole of the condensate can be weighed from any

Digitized by Google

one turbine. This tank, after weighing, is again discharged into a further tank, which is placed on the condenser floor in the turbine house, and the weighed water is pumped from this tank back to the common feed system. A "Permutit" water softening plant is provided for boiler feed make-up. The feed and steam piping has been designed and laid out in the simplest possible manner, for ease of operation and maintenance, special precautions being taken to allow for expansion.

Generating Plant.

The turbine house, which has an 80-ton crane equipped with an auxiliary 10-ton hoist, has an initial installation of three turbo-alternator sets, each running at 3 000 r.p.m., and each capable of giving a normal output of 12 500 kW at 6 600 V, with an overload capacity of 25% for two hours.

The normal conditions for which the turbines are designed are 250 lb. steam pressure at stop valve; 650 deg. F., total temperature of steam at stop valve; and 28·2 in. vacuum.

Each turbine is of the two-cylinder type, designed so that only steel is exposed to high temperature steam. Four comparatively small diameter pipes provide a flexible connection from the steam chest to the turbine cylinder, and pipes with corrugations are arranged on each side of the machines, to give flexible connections between the two cylinders.

The low pressure cylinder is made of cast-iron and incorporates a number of rateau impulse stages and "Baumann" multi-exhaust.

The turbines are arranged for two-stage feed heating. The oiling system of each turbine is complete with pump, tank, coolers and separator, and arrangements are made so that the separator can be put into service whilst the turbine is on load, and also that the oil can be drained from any turbine oil tank to the central storage tank.

The alternators are each capable of a continuous normal full load output of 12 500 kW at 0·8 power factor. The exciter is direct coupled to its alternator and is of the overhung type.

Each alternator is ventilated on the closed air circuit system. The coolers for each alternator are arranged in two units situated directly beneath the alternator, and enclosed by the foundations. At reduced loads it is possible to place the external fan out of commission.

The condensing plants are of the central flow, surface type, with the necessary extraction pump, rotary air pump, stand-by steam-operated air ejectors and circulating water pump. Each condenser has a cooling surface of 16 600 sq. ft.

The extraction pump discharges, through the various heaters, direct to the suction of the boiler feed pumps.

Each condenser is provided with a steam-operated air exhauster, to facilitate obtaining a good vacuum quickly when starting up.

The circulating water pump is capable of delivering 15 690 gallons of water per minute. Cross connections are provided on the discharge side of the three pumps.

The condensers, air coolers and oil coolers are all protected against electrolytic action by means of the Harris Anderson anti-corrosion system.

The condensing water passes through three duplex water cooling towers having a total capacity of 1 800 000 gallons per hour. In addition, sufficient condensing water for one 12 500 kW set can be obtained from the canal on the east side of the station.

Switchgear.

The switch and control rooms, on the east side of the turbine house, are arranged so that the operator in the control rooms has a complete view of the turbine house, which obviates the necessity of installing signalling apparatus.

The switch room is equipped with 6 600 V duplicate busbar electrically-operated draw-out metal clad switchgear, controlling the three 12 500 kW turbo-generators and six group feeders, so interlocked that it can be correctly handled with perfect safety.

The main units have two distinct triple-pole oil circuit breakers (having a rupturing capacity of 1 500 000 kVA), one for each set of busbars. These switches are motor operated. An interesting feature of the main (type JVD) switchgear is that each phase has a complete non-magnetic earthed metal enclosure throughout, so that, should any faults develop they will be earth faults only, the fault current being limited by the neutral earthing resistance.

The smaller units controlling the outgoing feeders have two triple-pole oil circuit breakers (rupturing capacity 750 000 kVA) in the one tank, which allow the feeders to be put on either set of busbars as desired. These switches are solenoid operated.

The generators are fitted with the self-balanced type of protective gear, which is so interlocked with the field suppression pillar that the latter equipment only functions when the breaker opens under an internal fault condition. Stand-by definite time limit overload protection is also provided. Over the feeder panel board is fixed an automatic indicating line diagram.

The supply of energy for auxiliary power and for lighting is obtained from three 1 000 kVA 6 600/400 V transformers. These transformers are connected to a low tension ironclad switchboard arranged on the switch room side of the turbine house at floor level. The supply to the boiler house switchboard is also controlled from this point. An 800 Ah battery is provided to operate the switchgear and to provide stand-by lighting when required.

The principal contractors and sub-contractors for the work were:—Boilers and superheaters, Babcock and Wilcox, Ltd. Economisers, E. Green and Son, Ltd. Soot blowers, Babcock and Wilcox, Ltd., and the British Soot Blower Co., Ltd. Induced draught fans, Davidson and Co., Ltd. Fan motors, Lancashire Dynamo and Motor Co., Ltd. Motor switchgear, Brookhirst Switchgear, Ltd. Instruments, Cambridge Instrument Co., Ltd. Steam flow meters, George Kent, Ltd. Turbo-alternators (three 12 500 kW sets), condensing plant, circulating pump motors, motor generator and switchgear, Metropolitan-Vickers Electrical Co., Ltd. Circulating pumps, Mather and Platt, Ltd. Transforming plant, English Electric Co., Ltd. Switchgear, Ferguson Pailin, Ltd. Battery, Tudor Accumulator Co., Ltd. Coal conveyor, ram tippers and capstans, Babcock and Wilcox, Ltd. Automatic coal weighing machines, W. and T. Avery, Ltd. High and low pressure pipework, Brightside Foundry and Engineering Co., Ltd. High pressure valves, Hopkinson's, Ltd. Low pressure valves, J. Blakeborough and Sons, Ltd. Steam driven feed pumps, G. and J. Weir, Ltd. Electrically-driven feed pumps, Mather and Platt, Ltd. Switchgear, Allen West and Co., Ltd. Cables, Union Cable Co., Ltd. Crane, Clyde Crane and Engineering Co., Ltd. Lifts, Etchells, Congdon and Muir, Ltd. Cooling towers, Premier Cooler and Engineering Co., Ltd. Circulating water pipes, Staveley Coal and Iron Co., Ltd. Canal pump, Mather and Platt, Ltd. Screening plant, F. W. Brackett and Co., Ltd. Water softener, United Water Softeners, Ltd.; Feed Water Regulator, Copes Regulators, Ltd.; Air Compressor, Belliss and Morcom, Ltd. Air compressor motor, Lancashire Dynamo and Motor Co., Ltd.

A BERMONDSEY EXTENSION.

THE new transformer station of the Bermondsey Electricity Department was formally opened by the Mayor on October 26th.

The entire output of the new station is controlled by what is claimed to be one of the largest d.c. switchboards in the country. It was manufactured at the Chelmsford works of Crompton Parkinson, Ltd. and the immense length of its 27 panels, totalling approximately 80 ft., with its duplicate busbars and its provision for the continuance of supply under abnormal conditions, have involved many special problems.

At present the panels control the output of five 2 000 kW and one 1 000 kW rotary converters, 36 three-wire 600 A feeders, 12 public lighting circuits and a panel for the battery to supply emergency lighting protective gear and operating current for e.h.t. switchgear. There is also provision for accommodating the switchgear for a further 2 000 kW rotary converter. The switchboard is of the flat back type with black enamelled slate panels mounted on an angle and flat iron frame. Each rotary panel is fitted with two s.p. interlocked 5 000 A breakers, both poles fitted with o.l. reverse current, time limit and overspeed devices, two dead beat moving coil ammeters, integrating wattmeter, two s.p. 5 000 A change-over switches, neutral switch and paralleling voltmeter. Each main feeder panel is fitted with d.p. o.l. breakers, with the necessary indicating devices and change-over switches.

Special provisions for normal expansion and contraction in addition to bracing and anchoring to withstand short circuit conditions are a feature of the busbar system, which is duplicated throughout.

The design is strikingly clear and simple, with spacious accessibility at the back of the board and easy manual control in front. It is interesting to note that the original Crompton switchboard, supplied at the inception of the undertaking over 29 years ago, is still in service.

BOOK REVIEWS.

The Universe Around Us. By Sir JAMES JEANS, F.R.S. (London: Cambridge University Press.) Pp. 352. 12s. 6d. net.

For the most part, this extremely fascinating book is of no direct interest to electrical engineers as such, but it will, nevertheless, appeal to members of the profession who can be interested in other branches of scientific work. The methods and results of modern astronomical research, as set forth so simply and clearly in this book, are intelligible to readers with little or no special scientific knowledge, and nowhere could one find a better popular exposition of the problems of cosmogony and evolution, and the general structure of the universe. Those who have heard Sir James Jeans's wireless talks on these subjects will know what to expect in the book. Those who have not heard will find this volume to be a storehouse of treasure and pleasure. W. L.

Steam Turbines. By T. M. NAYLOR. (London: Chapman and Hall.) Pp. viii+207. 12s. 6d. net.

In this book an attempt is made to meet the requirements of engineering students in their final years, and, if young, engineers engaged in the design, construction and maintenance of turbine plants should also find it interesting. As prior knowledge of thermodynamics and the properties of steam is assumed, no reference is made to these matter. The theory of lubrication is omitted for the same reason. There is, however, a chapter on condensers. The book is well and clearly illustrated. G. W. D.

Radio Receiving Tubes. By JAMES A. MOYER and JOHN F. WASTREL. (London: McGraw-Hill Publishing Co., Ltd.) Pp. vii+297. 12s. 6d. net.

In this book the essential principles underlying the operation of radio valves are clearly explained. But as the valve possesses a remarkable variety of functions, the book includes, in addition to the use of two and three element valves for radio reception and transmission, other applications of practical significance. These applications include the remote control of aeroplanes and sea-going vessels by the use of instruments in which the radio valve is an integral feature, as well as methods of applying radio valves to the remote control of humidity and similar uses. H. D. G.

Applied Geophysics in the Search for Minerals. By A. S. EVE and D. A. KEYS. (London: Cambridge University Press.) Pp. viii+253. 12s. 6d. net.

As the modern application of sound physical principles to the discovery of hidden wealth is even now not easily believed, this well authenticated treatise is very welcome, especially as it is founded on actual and varied practice in the field. In spite of conservatism in prospecting methods, there are many and various schemes of exploitation now available. Most of these are described in the book. The general methods described include magnetic, by magnetometer and dip circle, variometers, etc.; and electrical, by the natural current or self-potential, parallel wire, point electrode, leap frog, earth resistivity, porous pot, Gish Rooney and Megger methods, and the single electrode probe. Such electromagnetic methods as elliptic polarisation, equipotential, parallel wires and horizontal and vertical loops are also described. The book is the first we have seen dealing with the theoretical and practical sides of the numerous exploration methods now available. G. S.

Uber Kondensatoren und ihre Richung. By Dr. G. ZICKNER. Pp. 60. 3 Marks. (Leipzig: Hachmeister and Thal.).

This work may be said to be a treatise on the design and construction of condensers as used for wireless receivers. The work is not chaptered, but is divided into several sections, each of which deals with some specific feature in design. The first section is devoted to definitions of capacity and various formulæ are given; the relations between capacity, as well as resistance and impedance at various frequencies, and examples are worked. Table 3 in this section is interesting since it deals with the dielectric strengths of various kinds of insulating media. A considerable portion of the work deals with the calculation of capacity and condenser design. The derivation of formulæ is given for plate condensers with specific dielectrics, and for condensers in which several dielectrics are employed. This section contains several illustrations of condensers of various types and capacities. Some of them appear to be so peculiar in shape that, if the method of calculation were not given, it would be difficult to determine their capacity. The variation of capacity with frequency is also adequately treated. It is shown that the apparent capacity gradually decreases as the frequency is raised, thus tending to a limit of geometric capacity at infinite frequency. The last sections of the work deal with calculations of condensers in series, and in parallel, with inductances; fixed and variable condensers interconnected with inductances and change-over switches, which permits almost any combination of impedance to be obtained. If this book were written in English, we would predict a ready sale for it. CYRIL SYLVESTER.

Dynamische Lautsprecher. By Dr. EUGEN NESPER. Pp. 40. 2 Marks. (Leipzig: Hachmeister and Thal).
